

Engraved for Moor's Voyages & Travels.

GRAND PROCESSION of the PERSIAN AMBASSADOR

A NEW AND
COMPLETE COLLECTION
OF
VOYAGES and TRAVELS:

CONTAINING

All that have been remarkable from the earliest Period to the present Time; and including not only the VOYAGES and TRAVELS of the Natives of THESE KINGDOMS, but also those of

FRANCE, RUSSIA, SPAIN, PORTUGAL, GERMANY, ITALY, TURKEY, DENMARK, SWEDEN, HOLLAND, SWITZERLAND, PRUSSIA, &c.

WITH

An Account of the Rise and Progress of NAVIGATION among the various Nations of the Earth, and of the Discoveries of the Portuguese, English, Dutch, and French, in Africa and the East-Indies, and those of Columbus in the West-Indies, and the Continent of America;

With the Relations of MAGHELLAN, DRAKE, CANDISH, ANSON, DAMPIER, and all the Circumnavigators:

Including a most faithful Recital of the remarkable Voyages and Discoveries undertaken at the Expence of the PARLIAMENT of GREAT BRITAIN, and by Order of His present MAJESTY GEORGE III. in the SOUTH-SEAS, by those great and experienced Navigators,

BYRON, || CARTERET, || COOK, || FORSTER,
WALLIS, || FURNEAUX, || PARKINSON, || &c. &c.

TOGETHER WITH

An accurate Description of NEW HOLLAND, ZEALAND, OTAHEITEE, TANNA, the SOCIETY, FRIENDLY, and other newly discovered Isles, and their Inhabitants.

Likewise the Voyage of Mr. de BOUGAINVILLE to the SOUTH SEAS, by Order of the FRENCH KING.

A L S O

An Account of the Right Honourable LORD MULGRAVE'S EXPEDITION for the Discovery of a Passage towards the NORTH POLE;

A N D

A succinct Narrative of the VOYAGES and TRAVELS undertaken for Discoveries in the Northern Hemisphere by Order of Her Most Serene Highness the present EMPRESS of RUSSIA;

With a particular Description of the NEW ARCHIPELAGO discovered in the Prosecution of that Plan.

Comprehending a New and Extensive System of Geography,

DESCRIBING, IN THE MOST ACCURATE MANNER,

Every Place worthy of Notice, in Europe, Asia, Africa, and America;

A N D C O M P R I S I N G

A full Display of the Situation, Climate, Soil, Produce, Laws, Manners, Customs, &c. of the different Countries of the Universe:

A summary View of the various Revolutions of Government or Changes of Nature which they have undergone:

With a Discussion of several Phœnomena of Nature hitherto unaccounted for by Philosophers.

The Whole exhibiting a View of the Present State of the World; and calculated to give the Reader a clear Idea of the Government, Policy, and Commercial Interests, of all the different Inhabitants: Being the Result of unwearied Assiduity, assisted by the best Authorities.

By JOHN HAMILTON MOORE,

MASTER OF THE ACADEMY AT BRENTFORD, AND AUTHOR OF THE PRACTICAL NAVIGATOR, &c.

Assisted by several PERSONS who have made the SUBJECTS of VOYAGES and TRAVELS their particular STUDY.

Embellished with the most superb and elegant Set of Copper-Plates, Whole Sheet Maps, Charts, Plans, &c. (upwards of One Hundred in the Whole) that was ever given with a Work of this Kind; engraved from the Designs of Samuel Wale, Esq; Mr. Dodd, &c. by Grignon, Walker, Renoldson, Goldar, Taylor, Conder, and other Capital Masters.

V. O L. II.

L O N D O N :

PRINTED FOR THE PROPRIETORS :

AND SOLD BY ALEXANDER HOGG, AT No. 16, PATER-NOSTER ROW.

* * * The AUTHOR begs Leave to remark, that he found it impossible to comply with the common-place Method of beginning the Second Volume with a *Fresh Head*, or *Formal Introduction*, as the Part most proper for an equal Division of the Volumes happened to fall about the Middle of Mr. BRAND'S Travels through China: Therefore the Public will excuse this Deviation from a Custom, the Observance of which, in the present Case, he should have deemed a material Injury to a Work, in which he has employed his utmost Care and Attention.

J. H. M.

Bennett's sculp.

View of the FLYING BRIDGE, over the RIVER WHIANG-HO in China.

great officers of state, foreign ambassadors, and others.

The first apartment is called the Portal of great Beauty, or Purity; and it has three gates, which are never opened, but when the emperor goes out of town. Beyond this apartment is a vast court, adorned on each side with porticoes, supported by two hundred pillars, which present a grand prospect from the gate. The second apartment has five gates, three of which are never opened but for the emperor, but the other two admit the officers of state. Above each of these gates stands a spacious hall, adorned with a large number of columns gilded on some parts, and painted with vermilion on others. At the end of this court, is the apartment called the Portal of the Beginning; and behind it another apartment, called the Portal of the South, which is the first within the inner wall. The entry to this apartment consists of three vast arches, with halls above each, well built, and beautifully adorned with all sorts of paintings in gold and vermilion, according to the taste of the Chinese.

The next apartment is called the Supreme Portal, being far superior to any of those we have yet mentioned. It has five gates, and the ascent to each is by ninety steps; but before they can come to them, they must cross a moat filled with water, having five bridges over it. All these gates are adorned with beautiful pilasters, richly carved and finely painted. At the end of this apartment is the grand imperial hall, the ascent to which is by five pair of stairs, each of forty steps, and all of fine marble, curiously wrought. Two of these stairs are for the great officers of state, and two more for the eunuchs, that in the centre being for the emperor himself. During the reigns of the Chinese emperors, this hall was reckoned one of the wonders of the world, both for its architecture, and the richness of its furniture; but when the Tartars invaded the empire, great part of it was destroyed. This is the hall in which the emperor receives the homage of all his vassals, and gives audience to foreign ambassadors, as we have already seen in the account written by Brand. The hall is surrounded with grand pillars, each two whereof are divided at the top by an arch, which forms an opening below for every person, who has business at court, to stand according to his rank.

Beyond this is another spacious hall, called the Hall of Concord, where the emperor comes only twice in the year, to settle every thing with his officers of state concerning the government of the empire. Here all complaints are heard, and fresh instructions are given, and appeals are determined, which have been sent up from inferior tribunals. For this reason, there is at the east end of the hall a spacious apartment, with places for the emperor's judges; and before them are benches for the council to sit on, who have come thither to plead the cause of those who think themselves injured. Beyond this court are the emperor's private apartments, where he resides with his three empresses. It is called the Mansion of Heaven, clear and without blemish; and is the richest and most sumptuous of any in the palace. One of these ladies is considered as his sole empress, and the other two are treated according to the place they hold in his affections. They have separate apartments, and each of them has eunuchs and slaves to wait on her. But besides these three wives, he has a vast number of concubines, sometimes upwards of a thousand, but the children of these are not considered as of the blood royal. This custom is observed in Turkey; for Lady Wortley Montague tells us, that though the grand seignor has a vast number of concubines, yet the succession is confined to the children of a few.

Near the seraglio, or apartment for the women, the emperor has a spacious court, adorned with pillars and colonades; and in it are several rooms, where he enjoys himself with his ministers and friends. During these meetings, the veil, which covered majesty, and regal dignity, is laid aside; and here the

sovereign forgets his ceremonial pomp as a monarch, in order to enjoy the pleasures of a man. A little beyond this private apartment, is a grand magnificent building, where the emperor's horses are kept; and near it is a park, where he enjoys the exercise of riding when the weather will permit. All the servants under his master of the horse, reside here in different apartments; and there is a gate, through which they are allowed to pass, when they want to go into the city.

The bridge over the moat that surrounds the palace, is a most surprising structure. It is made in the form of a dragon, of an extraordinary size; and lively structure; and its fore and hind feet standing in the water, supply the place of pillars. His body forms the middle arch; his tail another; and his head and neck the third. The whole is of black jasper, so well closed and polished, that it seems to be all of one piece. It is called *Ti-kyang*, or the flying bridge; for the Chinese have a tradition, that this dragon fled through the air from a kingdom of the East Indies, which they call *Tyen-cho*, or the Kingdom of Bamboos.

In each of these courts of the palace there is a temple; and in all of them vast number of idols, to whom they offer sacrifices. Among these, is one noted for its obscenity; for the idol is represented naked, in the same manner as the Roman *Priapus*. It is only worshipped by the Tartars; for the Chinese hold it in abhorrence, and treat its priests as the worst of debauchés. The custom however of sacrificing to this filthy idol, is so much attended to by the Tartars, who probably brought it out of their own country when they conquered China, that the emperor, from political motives, is obliged to comply with it at least once in the year. If he were to neglect this, he would incur the displeasure of his subjects, that is, of those who are Tartars; and they are not only the most numerous, but also the most powerful.

All the structures already described are covered with large thick tiles, varnished with yellow, green, and blue; and fastened with nails; to withstand the winds, which are very high at Peking. These temples, palaces, and other public structures, being seen at a great distance, appear as if covered with plates of gold when the sun shines upon them; and the appearance is still more heightened by the azure and green, than which nothing that we can form any notion of is more beautiful.

The ridges, which always run from east to west, rise about eight feet above the roof; and the extremities are terminated with the figures of dragons; tygers; lyons, and other wild beasts, that wind about and extend themselves the whole length of the ridge.

The country around Peking is well cultivated, and it is surprising to see the number of inhabitants employed in many different arts and manufactures. No person is to be seen idle, they are all employed in one thing or other; and what is very remarkable; few of them ever visit foreign countries.

But we must now give an account of other parts of this extensive empire, beginning with those which are more to the south; and here we have ample materials, in the learned works of the jesuit, Father Navaretti. This jesuit had visited South America, and from thence crossed over to the Philippine Islands, where he staid some considerable time, and then set out for China. The hardships he underwent were the more so to him, on account of his superstition; but we shall keep as near as possible to his own words.

“Leaving Macoa (says he) we landed in China, and I was obliged to travel on foot for want of money. One day I went up a vast hill which tired me much; and there I found a house where soldiers were quartered to guard the roads, of which the Chinese are extremely careful. The captain seeing me going by, came out to meet me, was very courteous, and invited me into the house, to which he led me by the hand. As soon as I sat down, he ordered some drink to be brought to me, made of an herb called *Cha*, and seemed extremely affected with my sufferings. He

asked my Chinese companion how I came to travel in that manner; and as I had been robbed at Lea, was much concerned to find that my things had been stolen. This was such usage as I did not expect to meet with, but my companion told me that his countrymen were very hospitable to strangers. He gave us what provisions he could spare; and when we left him, wished us a good journey. I went on with my companion, who, though a Chinese, had been baptised, and was a Christian; but in going down the hill, it was so steep and craggy, that my feet were sadly cut, so that I was scarce able to stand. At the bottom of the hill we came to an infidel's house; but the people were so civil, that they boiled a chicken for our supper, though we had not money to pay them for it. While it was making ready, I was so much fatigued, that I fainted away; and though I presently came to myself, yet they thought I should have died. The infidel presently went into a room, and brought me warm cloaths to put on; and having eaten a little, he put me into a snug warm bed, so that I went to rest. I was astonished to see with what care this infidel attended me, for I could not have been better treated had I been in Spain. All this he did for nothing, which was what I did not expect among infidels. Next day, as we were entering a great town, my Chinese companion, with another who carried what things we had left, went before; and I was left behind, tired and out of patience, among thousands of Chinese, without knowing how to ask them any questions. I was very sick the whole of the afternoon, but no man offered to treat me uncivilly. At length my companion came to me, and we were kindly treated by the people; for I must acknowledge that the Chinese exceed in hospitality all I ever yet met with.

Next day, it being very cold, as it was then near the middle of October, we continued our journey till we came to a river. I took off my shoes and stockings, and waded it in the water up to my knees, and was very sensible of the violent cold. Soon after we had crossed this river, we spied a dreadful tyger, laying on a rising ground, close by the road, which frightened us much, for it was as big as a calf; Providence however protected us, for we stooped that it might not see us, and thus we remained unhurt. That day we came to a populous town, seated on a fine navigable river, with many vessels upon it, and we thought to have got a boat presently, but we could not, for the people were all in an uproar, because they had received information that a band of robbers were abroad. At that time the Southern Chinese had taken up arms against the Northern ones, whom we call Tartars; but we took no part in their quarrel, for having procured a lodging we went to rest; and next day a boat landed us safely at the famous city Chang-cheu.

The city Chang-cheu is very much celebrated in China, and most of the inhabitants carry on an extensive trade to the Manilas. It is situated in the province of Fo-Kien, and cost the Tartars much blood and treasure to subdue it; for being a frontier as well as a trading town, the people did not willingly part with their antient privileges; but it was conquered by superior forces, and is now subject to the Chinese emperors of the Tartarian race. It was about the dawn of the morning when we landed at this famous city; and curiosity led me to take a walk into the principal streets, one of which was the finest and the fullest of people I had ever seen. But what surprised me most was, to hear the people, as my interpreter told me, saying to one another, This is one of the Fathers of Manila. I was much frightened lest they should have treated me in a cruel manner, so that I went on as fast as possible, to escape the danger which I imagined to be hanging over me. I thought the street would have no end, for it was above a mile in length, and the fronts of the houses were finely adorned with pillars and carved work. Troops of horse were marching out of the city in great confusion, and I expected every moment that I should be ap-

prehended; for the people, where we thought to procure provisions, would not suffer us to come into the market place. In this uncertain state we went into the boat, in order to be ferried across the river; but there were many other passengers on board, who kept their eyes fixed upon me all the time we were there.

It took up above four hours for us to sail down the river about as many leagues; and when we landed, I thought myself in a new world.

Having travelled about two leagues, we met with a tall, fierce-looking Chinese; but though he was terrible to us at first, yet in the end he seemed to have been an angel sent from God. He came up to me, made much of me, comforted me, and by signs made me to understand that I need fear nothing, for he would take care of me. I understood a little of what he said, and my Chinese companion explained the rest to me very well. He took us to his lodgings, and gave me the best room; when we eat, he gave me the best victuals; he took me by the hand, and placed me on his right side, and always took the same care of me as if he had been my tutor or guardian; and I may safely say, I never saw a better tempered man in my life.

Next day we continued our journey, and met with another Chinese, who treated us in the same hospitable manner, and accompanied us to the city of Civen-cheu. I was surprised to see such a place; for as we viewed it from an eminence, it seemed to be a little world within itself. When the Tartars took it, the walls were destroyed, but they were again rebuilt in a most masterly manner, within the compass of two years; we walked round the walls, and counted the number of cannon, which amounted to upwards of one hundred and seventy, for I could not count the smaller ones, my attention being led off every moment to view things of another nature, which constantly presented themselves to my notice.

Leaving this city, where we were hospitably entertained, we came to one of the most remarkable bridges I had ever seen. It is laid over a navigable arm of the sea, where formerly a vast number of people used to be drowned; and to prevent these fatal accidents for the future, Cai-Jang, a man of knowledge and benevolence, governor of this country, caused the bridge to be erected at his own expence. It is in length thirteen hundred and forty-five paces, and the piers upon which it stands are above three hundred. The intervals between them and the water are not arched but flat, each covered with five stones locked into one another. The sides are adorned with beautiful balustrades, with globes, lions, and pyramids, at equal distances, which makes it have a most graceful appearance. The whole work is of a fine blue stone, so deep coloured, that at first sight it appears black; and though founded in the deep sea, there is neither lime nor iron about it, the stones being fixed artificially to each other, and notwithstanding it has been built years, yet it does not seem to be in any danger of falling. There are on it five stately towers at equal distances, with strong gates, and guards of soldiers. As I was travelling over it, the passengers told me the following story: Formerly, when they crossed this arm of the sea in boats, a woman with child went on board; and the master told her, that she should be delivered of a son who would come to be a great mandarin, and so powerful, that he would build a bridge there at his own expence. They relate that it happened so, and the child proved to be the same Cai-Jang, whom we have already mentioned.

We must here, in justice to Father Navaretti, observe, that he treats this story as an idle tale; but indeed there is nothing at all extraordinary in it; for we seldom or ever read of a great man, but after his death stories are forged, pointing out something foretold concerning him before he was born. A thousand instances of this nature might be mentioned; but we shall pass them over in silence, and go on with the jesuit's narrative.

“ Three days after we had crossed this famous bridge, we met with the general of Fo-kien, who was marching to Chang-cheu, with twenty thousand men. I was in great confusion and distress on this occasion, considering in what condition a poor religious man must be, in a strange kingdom, and amidst an army of idolators. The two natives of China, who accompanied me, were so good-natured, that I know not what I should have done without them; not that any man spoke to me, or offered me the least incivility; but merely because of the multitude of soldiers, to whom, as being unacquainted with their language, I could give little or no account of myself; supposing it had been requested of me, nor did I know what my interpreters might have said, especially as the accounts I had heard of the country, made no favourable impression upon my mind.

We passed within sight of the general, whose army marched near the shore; and it was surprising to see what a number of waggons and baggage horses he had to attend him. We had not passed him above a mile, when we came to the top of an eminence; and here again our fears were renewed, for we saw another large body of men coming up, with pikes in their hands, and making a very formidable appearance. They lined the road on both sides, and we passed through them without their offering us the least injury. Indeed, I may justly say, what I have often heard from some of our brethren who had travelled into those parts before, that a man is in more danger in travelling through an army of Europeans, than one of Tartars. The country cottagers had their fruit and provisions set out at their doors to sell; as it is never known in that country, that a soldier does any injury to the people; for let an army be ever so numerous, the people are never in the least afraid of them. So strict are the laws concerning the military, that I once saw a Chinese soldier beheaded, for cheating a countryman of about the value of an halfpenny, in buying some rice.

Before I came to the metropolis of Fo-kien, called Fo-cheu, I sent my Chinese into the city, to enquire whether there were any jesuits there, and to find out the church. It was long before he came back, which troubled me much, because I did not know but some accident might have happened to him, or he might have been taken up for a spy.

In the mean time my other companions took me to an inn, as good as any I had ever seen, either in France or Italy. We passed through two courts, and found a table covered with all sorts of provisions, besides a vast variety of fruits and sweetmeats. I was extremely hungry, but it being the eve of St. Simon and St. Jude, I was afraid to eat, though my condition was such, that I might have done it without any scruple of conscience. My countenance exposed my sorrow, but those infidels did not know the reason, and yet they used every means to comfort me. It pleased God the Chinese returned soon after, and with him a Christian of that city; but, for reasons I could not learn, this Christian left me immediately, and I saw him no more. Perhaps he imagined I wanted some money to help me on my journey; but I am rather inclined to believe that he considered me as an impostor.

Next day I was visited by a physician, a Christian, who not only treated me with tenderness, but likewise assisted me with something to support me during the remainder of my journey. We rested here two days, during which time I took a view of the city, which I found to be extremely beautiful, adorned with infidel temples, some of them dedicated to the sun, and others to the rest of their idols; and though this is one of the least metropolitan cities in China; yet it was amazing to behold the vast number of inhabitants, and these only men, for the women are not permitted to be seen. The streets I went thro' were exceedingly broad, and though not paved, yet they were very clean; with shops on both sides, containing every thing one could think of. Going along, I met three of their mandarins, and was ordered to

make room for them; and I stood as it were amazed, to see with what gravity they rode on horseback, and what a numerous retinue they had to attend them.

Leaving this place, we travelled five days together, without meeting with any thing remarkable, only that one Charles, a Christian, happened to be coming that way, and as he knew some of my order, he not only gave us proper directions concerning the road, but likewise some money to defray our expences. Five days longer we travelled over hills, whose tops seemed to reach to the clouds; but, thank God, we met with no harm; and the last night we lay in a little castle, in which were about fifty soldiers. It is almost incredible to think what civility we met with in this place. The commanding officer, who had a good room, quitted it for me to lay in it, though I endeavoured to be excused; yet he insisted on my accepting of it, and went himself to another. I was amazed at such usage among infidels, whom the Europeans, who are not half so humane as they, call barbarians.

Next morning the commander came to take leave of us, and begged pardon for the entertainment not having been better; which made such an impression upon my mind, that I believe I shall never forget it. That day we travelled over seven steep mountains, on the last of which it rained hard, so that we were obliged to take shelter in the cliff of a rock. I was both hungry and tired, for my companions had deceived me in the number of miles; but one of the Chinese happening to have some boiled rice in his pocket, I ate heartily of it, and thought I never tasted any thing so sweet. As we went down the hill it rained again; and we met a company of horsemen, who saluted us according to the custom of their country. That evening brought us to the city of Fo-nagan, but we were so late, that the gates were shut; so that we were obliged to take up our lodging in a suburb; where we had a bad night indeed, for there were no necessaries to be had; nor could we get a fire to dry our cloaths. Wet as I was, I lay down upon some straw, but the cold was so intense, that I could not feel in a manner whether I was dead or alive. It was the worst lodging I had had during the twenty days I travelled in China; and it was well we could get any at all; because there were a great number of soldiers quartered, not only in this suburb, but in almost every part of the neighbourhood.

Next day we went into the city; and as soon as I had found out a jesuit, he took me to the church, where I heard mass, and was so much overjoyed to find those of my own order in the place, besides several convents, that I forgot all my former sufferings. During my forty days journey hither, I did not see more than three women, although perhaps near a million of men. One of these women was near the river side; another was at a considerable distance; and the third was at the door of a house as we passed through a village.

The city of Fo-nagan is very much renowned in the province of Fo-kyen, and it suffered much when the Tartars invaded this empire. It submitted upon capitulation, that none of the inhabitants should be injured; but no sooner were the Tartars in possession of it, than they massacred fourteen thousand men, among whom was a Christian, who commanded the Chinese army against the Tartars, and who might have been saved, but he would not give up his authority. Lau-Chung-zao, the governor of the city, a man of great bravery, knowing the Tartars would shew him no mercy, resolved to poison himself; and accordingly sent for some of his friends, among whom was the Christian, the commander already mentioned, and he, the governor, invited them to follow his example.

They all excused themselves, and he took the poison alone; soon after which, he expired in his easy chair, leaning against a table, and in that posture he was found when the Tartars took the city. They made several low bows to his dead body, commending his

his loyalty in dying in such a manner, rather than to give up the city to those whom he considered as his enemies.

The first thing I did, after I had got a few days refreshment in this city, was to set about studying the Chinese language; and such progress did I make, that in a few months I was able to preach. During two years I resided in this province, many converts came to me to confess their sins, and, as far as I could judge, I found them very sincere. Having now learned the language, and my beard being grown, I thought it would be time for me to continue my journey to some other parts of this vast empire; for I had already converted a vast number of the infidels, all of whom had been confessed, and had received the sacrament. Along with me went two christians, and an infidel who was upon his conversion; they were natives of the inland parts of the country, and as good-tempered men as ever I had met with.

The second day of our journey we came to the highest mountain I ever saw in my life, and this, with a few smaller ones adjoining to it, took us up eleven days to cross; but at the end of every league, or sometimes less, we found resting-places, and so neat, that nothing could be fitter for the purpose. All China is furnished with these resting places, and has exceeding good roads. On most of these mountains we saw heathen temples; but the ascent to them was so steep, that we did not chuse to visit them. There were others in the valleys, and some by the road side. Those last had hot water standing at their doors, with the herb cha, for passengers to drink. The priests of these temples are called bonzes, and they beg from passengers as they go along, but are extremely civil, for if any thing is given them, they make a low bow; but when it is refused them, they stand still and say nothing.

When we came to the limits of the province of the Kiang, we found the passage was between two vast high rocks, where was a guard of soldiers, and a little farther on were their quarters. There we stopped a little, and ate some of the herb cha, which was very refreshing to us after our fatigue; for provisions were at that time very scarce in the country, on account of the vast numbers of soldiers that were quartered in almost every city, town, and village, and even in private houses.

The commanding officer gave orders to one of the soldiers to search our baggage; but our infidel Chinese, whom we had along with us, told him it had been searched already, upon which he proceeded no farther, but suffered us to pass. Soon after we came to another narrow pass, somewhat like the former; but the guards were much more numerous. Here the sun shone bright upon us, and we rested ourselves about two hours. There were many people coming out of a temple, and they all bowed to me, without saying any thing. During that time I saw a woman, which was the first I had seen in China, come up from a valley to go to the temple, and as she passed the soldiers, they all bowed to her. I was much pleased with the modesty of the soldiers, but could not learn who the woman was, or what was her character, which I was the more earnest to know, because one seldom sees a woman in that empire. The next evening we lay at an inn, where I saw another woman, which was the first and last I ever saw at an inn in China, though I lodged at many.

The next place I arrived at was Kin-Hoa, a spacious city, surrounded by pleasant gardens, and extremely populous in appearance; for in all the cities of China, we meet with vast numbers of people. There is one thing indeed which encreases the popularity, and that is, that as often as a mandarin, or any other magistrate, goes abroad, all his attendants follow him. In this city our brethren had a church, and it was my turn to baptise several of the Catechumens, or new-made converts, which I did; but soon after they relapsed into idolatry. Indeed I often found that few of those whom we had baptised in China

held out long; they soon returned to their former idolatry; and died infidels, as they had been before. We were often molested by the mandarins, who came frequently to visit us; and they pretending to enter into disputes concerning religion, we told them, that our religion had God for its author, and all they who rejected it would perish everlastingly. This, however, did not satisfy them, for they had the assurance to tell us, that their gods were equal to ours. Nay, they often ridiculed our holy ceremonies, telling us, that they knew no difference between the worship of a hog and a wafer. I soon found that little good could be done in this place; and therefore I resolved to leave it, having seen in it every thing worthy of my notice.

The city of Kin-Hoa is situated upon an eminence; having a river running below it; and the prospect from the houses is both extensive and delightful. Here are many fine buildings, and a vast number of temples, where the people go to worship their idols. These temples are curiously constructed, each having a sort of pyramid on the top, in the form of one of our spires; and around them are gardens for the priests to walk in when they converse with the Devotees. The streets are broad; but so much crowded, that a stranger scarce knows how to get along; and there are so many shops for all sorts of Chinese goods, that one who is not acquainted with the country, would not imagine there was a dwelling-house in the city. There are men appointed to keep the streets clean; but that is in a manner impossible, for in hot weather the dust becomes suffocating, and when rain falls, the whole is like a puddle, or mire. The people have plenty of all sorts of provisions, particularly mutton, which seems to be the most favourite flesh, made use of by the inhabitants in winter; but in summer they have another dish still more agreeable, it is called Teu-fu, and, is a sort of paste made of kidney-beans. They draw the milk out of the beans, and squeezing it together, make it up into great cakes, somewhat resembling cheeses. The body of it is as white as snow, and to look at it, nothing can appear finer. Sometimes it is eaten raw as we eat cheese; but the most polite way is, to boil it, and dress it up with herbs, fish, and vinegar. When eaten alone by itself, it is very insipid, but dressed in this manner, is exceeding good, and so it is when fried with a little butter. They have it also dried and smoked, and mixed with carraway seeds, which is the best of all. It is incredible to think what vast quantities of it are consumed in China, and much more surprising still to think where they can procure so many kidney-beans. This is easily answered; China is one of the most fertile countries in the world, and yields all sorts of herbs. These beans grow without cultivation; even in the scarcest times this food may be had so cheap as one halfpenny per pound, which is above twenty of our ounces, and it is of great service to those who travel, because it may be eaten raw like our cheese; or if they have an opportunity, they may dress it. It has one quality peculiar to itself, and that is, it has the same effect upon the constitution, let the climate be what it will; and it is well known that in such a vast extent of territory as the empire of China is, there must be a variety of climates. This is the reason why the teu-fu is so much esteemed in China, for it frequently happens that merchants travel from one extremity of the empire to the other, which they could not do without food of this nature.

Leaving this part of China, I took leave of my brethren, it being my inclination to visit the capital of the empire, where I knew our order had a church. I thought at first to have gone by land; but the many difficulties which presented themselves to my view, induced me to alter my proposed plan, and make use of the most easy conveyance. Accordingly, I ordered a boat; but no sooner was it ready, than I found myself under fresh difficulties.

The officers appointed to conduct me, intimated, that

CHINESE method of taking WILD-DUCKS.

Also their way of CATCHING FISH, and a famous WATER CASTLE.

that they expected more money than their due; which at first did not surprize me much; because I had always found these sort of people taking every opportunity to impose upon strangers, and get from them all they could. I did not rightly know in what manner to conduct myself; I was among strangers and infidels; and though I knew something of their language, yet I was intirely unacquainted with many of their customs. Ever submissive to the civil power, I was determined to be obedient in all things, so far as they did not interfere with my religious sentiments, and even comply with their extortion as far as lay in my power. This I considered as the real mark of a Christian, and I am sure it is consistent with all the rules laid down by our society. Had resistance been legal, it would have been imprudent, and every one must know that prudence is a moral, as well as a Christian virtue.

They assigned me an officer to attend me, who appeared to be too busy, and I began to imagine that he would in the end become troublesome. This gave me some uneasiness; so that in order to make my journey as agreeable as possible, I sent a small present to the clerk, desiring him to send me another officer in the room of him who had been appointed. Accordingly another was sent me, who, from his whole conduct, gave me cause to have a different opinion of him than I had of the first. I had not sailed above half a day from Kin Hoa, when I was overtaken in another boat by my companions, and we sailed together five days longer, not imagining that any thing more than common was to happen to us; but we were mistaken, for on the 6th day, the chief magistrate of the city overtook us, put us in irons, and sent us back under a strong guard to Kin-Hoa, where we were confined in prison eight days, without hearing of any crimes that had been imputed to us. All that time I lay upon a few boards, with a blanket over me; and such was the severity of the season, that I almost lost the use of my limbs.

On April 21, we were taken out of prison, in order to be sent to the imperial city; and though a boat was allowed us at the public expence, yet they made us pay for another, under pretence that the first was not good enough.

A guard of horsemen were appointed us, who rode by the side of the canal, and were every now and then relieved by others; for one seldom comes to a stage without meeting some soldiers. These soldiers, as well as the sailors who conducted the boat, treated us with all manner of civility; and whenever we told them we wanted any thing, they went and brought it to us.

After sailing ten days upon the famous canal which divides China in an equal line from north to south, we came to the city of Zu-Cheu, and rested there five days, being much fatigued. In this city I met with some of my own brethren, who, like myself and my companions, were prisoners, having been taken up on suspicion; the people being utterly ignorant of our real characters. At the end of the five days we proceeded on our voyage up the canal, and came to the Red River, which frightened us much on account of its vast number of whirlpools. Just as we passed this frightful place, we met with two more jesuits, who were prisoners like ourselves, and we were much delighted with their conversation.

It is impossible to describe the vast numbers of vessels we saw on this canal, and on the Red River; some were small, others of considerable burthen; and it frequently was with great difficulty that we could get through them.

At the custom-houses the water was entirely covered with them; and it sometimes happened that we were detained two hours before we could be admitted to have our baggage examined. At each of these custom-houses were two Tartarian officers, who got above fifty pounds a day each, in presents from the passengers. We disputed with them concerning the legality of their fees, but we soon found that they had

too much power to pay any regard to our arguments.

Leaving our boat, because the water was fallen, we went on shore, and travelled two hundred leagues over a plain country, with carts, in which we were placed as malefactors. The weather was extremely hot, but every now-and-then we met with a cooling stream, and the poor peasants in the country sold us apricots for a penny a dozen, and eggs at the same price. In this valley we thought to have converted a mandarin, who declared that he was willing to be baptized; but when we told him that he must part with all his concubines, he refused to comply. However, he made us a present of a sheep, with some rice, and such other things as we wanted. He was a man far advanced in years, had a son who commanded in the army, and who had been advanced to a very high rank. He told us he loved our religion extremely well, but he could not either in conscience or honour turn off his wives, and leave them to starve in order to please our God.

It is wonderful to think what numbers of people we met upon this road, some on mules, some on asses, others in litters; and others carried in sedans. All that passed knew us by our beards: some endeavoured to comfort us, by telling us that all things concerning us were settled, so that we would be set at liberty; while others said that we were in a very unhappy situation, which was what we expected; none of these things affected us, for as we had not given offence to any one, so we knew that our own consciences did not condemn us. But I must not leave this part of the subject without taking notice of the country through which we passed. And here I am, as it were, at a loss, to describe its many beauties, and its admirable delicacies. We saw thousands of men and boys employed in husbandry, and the whole of the country wore the appearance of a garden. The houses were numerous, small, neat, and clean, in their outward appearance; for we were not permitted to go into any of them. Every house had a small inclosure before the door; and behind, the garden was overspread with trees.

Adjoining to the houses is a separate building all on one floor, the windows of which look into the garden, and this is the place where the women reside, no man being permitted to visit them besides their husbands. In some countries this would seem a harsh restraint, and it is certainly inconsistent with the natural rights of human beings; but this makes no manner of difference in China, nor indeed in any of the eastern countries where the women are brought up from their early infancy, without ever conversing with the other sex till they are married. The women spend their time in domestic offices, in nursing their children; and as they are utterly unacquainted with what passes in the world at large, or even in their own neighbourhood, so consequently they can have no aspiring views, nor do they ever hope to see their condition changed while they are in this world.

All the way as we travelled along, we saw very beautiful villages, with some market-towns; and as they have particular markets and fair-days, so we saw vast numbers of the country-people carrying their fruits, corn, herbs, and other things to be disposed of at these places for the benefit of the inhabitants.

We did not hear a single complaint either of theft, robbery, or murder; for the people travelled together as all mankind ought to do; that is, as children of the same common family. Happy if we Europeans could, or would live in this manner; but something unattended to prevents it. We value ourselves on our politeness, which in some measure may be true; but be this as it may, taking the great outlines in one point of view, are not we in many things more destitute of humanity, than many of those whom we are weak or foolish enough to call Barbarians? I only mention these things, that Europeans may learn not to accuse the inhabitants of other parts of the world of cruelty and barbarity, until they have first

first convinced mankind that they themselves are more humane. But leaving these reflections, I shall go on with my narrative.

On the eve of St. Peter and St. Paul, in the morning, we came into the imperial city of Peking, and were soon enough to attend mass in the church of the jesuits, and to dine with our brethren. Within a few days we were joined by those who lived in other provinces; so that we were about thirty in number; and would have been more, had not some of our order made their escape in a Dutch ship, bound for the Manilas.

We continued in the imperial city till the 13th of September, on which day we received sentence of banishment to Macao. This is a small territory subject to China, which had been in possession of it one hundred and fifty years. However, upon a representation of the conduct of the Portuguese having been made to the emperor of China, he ordered them all to be expelled, or to pay a certain ransom as should be imposed upon them. The latter they complied with; and though they receive some benefits arising from trade, yet they are kept in such a state of slavery by the Chinese, that they are the most miserable beings in the world. Every foot of ground they have is taxed, and they are obliged to pay duty for every thing they import. But notwithstanding all these disadvantages and discouragements, the place continued for many years to flourish; and when I arrived there, I found no less than three churches, and five convents. The people, natives of the place, traded chiefly with the Japanese and the Portuguese, by exchanging goods with them, and acquired considerable profit. But the Spaniards having made settlements in the Manilas, the trade of Portugal first fell into decay, and soon after the Dutch engrossed the whole commerce of Japan to themselves.

The inhabitants of Macao, that is the original ones, are all Chinese, and there they carry on their different manufactures; but many disputes have arisen from time to time, between them and the jesuits, who had been sent missionaries from Spain and Portugal. This gives much offence to the Chinese government; so that at one time an order came to expel all the jesuits out of the place; but some of their brethren in Peking procured them favour. It is certain that the jesuits, though in many respects men of very exalted characters, have always made themselves too busy in meddling with the affairs of secular princes; and as for many years they reigned as lords over the consciences of men of the highest rank in Europe, so they were vain enough to imagine they could do so with the Asiatic princes.

A little before I came to Macao, the catholic bishop had committed a woman to prison for living in fornication with a Tartarian soldier. This part of the bishop's conduct gave great offence to the soldiers; and accordingly at noon day, they came and broke open the prison doors, and set the woman at liberty, not one daring to call in question what they did. Much about the same time a young woman, who had been baptized, ran away with a Chinese; and many others did the same: for though the bishop imprisoned above sixty of them, yet all these women found means to make their escape; so that our labours proved in a manner unsuccessful.

While we were at Macao, I made so many converts, that I was obliged to get another of our brethren to assist me in hearing their confessions; but what grieved me much was, that I found some of our order had extorted money from the people when they came to confess their sins. The Chinese magistrates in Macao did not esteem us much, for they took every opportunity in their power to affront us in one respect or other. One day we had a procession in honour of St. Ignatius, our founder; and, as if it had been to mortify us as much as possible, the governor of the place ordered a coffin to be carried on the shoulders of six men, just beside the image of our Saint. One of my converts drew his sword, and would have stab-

bed the men, but I restrained him, lest we should have been all massacred. We continued several months in this place; and from thence went again for the Manila Islands, where we were kindly received by the bishop and clergy." So far this learned jesuit, who, like many others of the Roman Catholics, appears to have been both superstitious and credulous, but relates no more than what came under his own observation.

We shall now attend, more particularly than we have hitherto done, to what has been written by another learned jesuit, Father Le Compte, who resided in that Empire upwards of twenty years. Speaking of the populousness of China, he gives us a more rational and consistent account of it than we have ever met with. He says, "The inhabitants of a place, with respect to numbers, are not to be properly known from viewing the crowds we meet with in the streets, and particularly at Peking.

First; Because from all the neighbouring towns vast numbers of peasants daily flock to Peking, as the capital, with all sorts of useful provisions, and other commodities, which, for want of a river, are brought by land. This fills the city with multitudes of carts, waggons, camels, and other beasts of burthen; so that mornings and evenings, when the gates are opened and shut, there are such vast crowds of people going in and coming out, that one is obliged to wait a considerable time before admittance can be obtained; and yet few, and sometimes none of these are citizens; so that while the city is thronged with people, the country has scarce any left in it, besides women and children.

Secondly, Most artificers work in their customers' houses; not only taylor and shoe-makers make cloaths and shoes at every man's house or lodgings, but even their smiths carry with them their anvil, furnace, and other implements for their ordinary use. So that they are continually about, looking out for business, which much increases the throng.

Thirdly, When a person of rank goes from one part of the city to another, every person belonging to him follows in his train, except the women. Now as the Chinese are fond of pomp and grandeur, and as they keep as many servants as their circumstances will permit, so it is no wonder that such vast crowds should be daily seen in the streets.

Lastly, When a mandarin goes abroad any-where, all his officers as well as domestics attend him, and sometimes one of these mandarins will have two or three hundred in his train. The princes of the blood, and all the great officers of state, go always abroad with large troops of horsemen; and as they are obliged to be at court once every day, so their equipages alone are enough to crowd the streets, supposing there were no other persons in it but them. These things serve to shew, that Peking is far from being so populous as it appears to be, but it is allowed that there are near two millions of inhabitants in it."

We have already taken notice that the emperor has only three wives, or empresses, whose children can be legitimate, but let us hear what Le Compte says of his concubines.

The number of the emperor's concubines, (says he) is never known, nor is it fixed. They are never seen by any man but himself, nor is any person permitted to enquire concerning them, though the emperor sometimes diverts himself in company, when he reflects upon their virtues and accomplishments. They are all women of quality; which the mandarins, or governors of provinces, chuse out, and send up to the palace; where they are kept from all correspondence, even with their own parents. Many of them are never taken notice of by the emperor. Each has a separate apartment, with women to wait on them, together with all sorts of the most costly furniture. They are not permitted to converse on any subjects relating to civil affairs, nor are secrets communicated to them; for the Chinese say, "That Heaven has endowed women with good nature, modesty,

defty, and innocence, that they may look after their families, and take care of the education of their children; but men only have strength of body and mind to rule the world." And therefore, by way of jest, they call Europe, *The Ladies Kingdom*, because there the sceptre often falls into the hands of women.

The Chinese rank their cities into three classes; the first contains about one hundred and sixty, and these are for the most part capitals of provinces. The second class consists of two hundred and seventy, and these subordinate to the jurisdiction of the first. The third class consists of twelve hundred, which are of less note than the second; and they have three hundred walled towns, where garrisons of soldiers are constantly kept. The villages are almost numberless, especially in the southern provinces; and in the provinces of Xansi and Xensi they are for the most part surrounded with walls, ditches, and iron gates, which the people shut at night, and guard in the day time, to prevent being robbed and plundered by parties of Mongul Tartars.

Before the Tartars conquered China, Nankin was the capital city; and though it is in some measure fallen to decay, yet there is still so much to be seen as to point out its former greatness. It has rather the appearance of a ruined province, than a city; for it was formerly inclosed within three walls, and was no less than forty miles in circumference without, which is little less than the bounds of the antient cities of Nineveh and Babylon.

When the inhabitants resided in this famous city, they were in a manner numberless; its situation, fertility of soil, and commodious haven, all joined to promote the riches and grandeur of the place, and its commerce extended to most of the eastern nations. The streets are paved, which is an advantage Peking does not enjoy; and the houses, though low, are neat and clean, and the shops filled with all sorts of rich silks, with many other sorts of costly wares. It is situated in the centre of the empire; and though it is not now the metropolis, yet it is still more populous than Peking. All the mandarins, and other learned men who are out of employment, come to this place for the benefit of study, there being several excellent libraries maintained at the public expence. There are several printing-houses here, and the workmen are reckoned the most ingenious in the empire, being far superior to those in the capital city. Nothing but political reasons of state could prevent the emperor from residing here, for it has the following conveniencies which Peking does not enjoy.

First, it is situated on the river Ikiam, which is the largest, deepest, and most navigable in the whole empire, being above a mile broad at the city side. Secondly, there was a royal observatory on the top of a mountain, which is now too much neglected, but would rise again into repute if the court was kept here. Thirdly, there is a strong tower, built in the form of a castle, which was formerly a magazine for arms, and in it a garrison of soldiers were kept; but the chief design for which it was built, was to be a place of refuge for the emperor and his court during a siege. And lastly, there is a grand structure without the gates, called the Temple of Gratitude, built about four hundred years ago, by the emperor Yon-lo, and was once the most magnificent structure in the empire.

It is raised on a strong foundation of large bricks, and encompassed with a rail of unpolished marble. The ascent to the first hall is by twelve steps, and the front is adorned with a spacious gallery, with curious pillars. The roofs are covered with green shining tiles, and the ceiling is painted in several pieces, differently wrought, which, with the Chinese, is considered as a very great ornament. It has no light but what comes in at the doors, which are three, and extremely large. Its figure is that of an octagon, each part being fifteen feet wide; so that it is forty feet in breadth, and one hundred and twenty in circumference. Round it is a wall supporting a pent-

house, which comes from the tower, and forms a pretty sort of gallery. This tower is nine stories high, each story being adorned with a cornice three feet wide at the bottom of the windows, and distinguished by little pent-houses as the former; but every story is narrower and narrower, as the tower rises higher. The wall at the bottom is at least twelve feet thick, and above eight and a half at the top, covered over with China plates; so that when the sun shines upon them, it dazzles the eyes of the beholder. The stair-case is narrow, and troublesome to ascend, because the steps are very high, which renders it very inconvenient to those who are not accustomed to it. Each story has a room floored with timber, and the ceiling is beautified with paintings. The walls of the upper rooms have niches in them; in each of which is the figure of one of their idols, and these have a good effect on the beholder who views them at a distance. The greatest part of the building is gilt over, and looks like carved stone or marble; but it is only a fine sort of brick, which the Chinese are very ingenious in making.

The whole building from the bottom of the basis to the top of the cupola, is two hundred feet, and the cupola is of itself a very grand ornament to the structure; being like the mast of a ship, about which runs a spiral line of iron at some distance from it, and on the top is placed a large gilded ball. From this tower one has a prospect of the whole city, the river, and all the country adjoining, to a vast distance, where a sort of terrestrial paradise presents itself to the view; containing cities, towns, villages, and a thousand other objects, which lead the mind away in a sort of pleasing captivity. This city is likewise famous for its bells, of which there are three in so many different towers; and these were constructed and hung up under the direction of the jesuits, in the same manner as those at Peking. These bells do not differ much from each other in size; and though they are all less than the great bell we have mentioned at Peking, yet they are so large, that their sound is heard at a great distance. They are tolled every hour in the night; and serve as a signal for the watch to go round, to see that every thing is kept in proper order, and that no person is found walking in the streets; for all those who are found out of doors, are taken into custody till morning, when they are carried before a magistrate, and obliged to give an account of themselves.

Sigen, the capital city of Xensi, is three leagues in circumference, and the walls encompassing it form an exact square. Its ditches, which are partly dry, are very fine, its walls are high and thick, as well as the towers built upon them, and the gates are stately like those of Peking. The city is divided into two parts by a wall of earth; the northern part being inhabited by the Tartars, and the southern by the Chinese. Each of these divisions maintains a garrison; but that inhabited by the Tartars is by far the strongest, for ever since the present royal family came to the throne, they have made it an invariable rule to depress the antient Chinese as much as possible. Here is an old palace which was the residence of the former emperors, who were powerful not only among their own subjects, but likewise in their conquests of several of the neighbouring provinces. The houses in this city are low, but exceedingly neat; and though the trade is not extensive, yet the inhabitants enjoy many privileges, nor are they much burthened with taxes. They have plenty of China-ware here, but it is not so fine, nor well polished, as in other parts of the empire.

The next city deserving our notice, is Ham-cheu, the capital of the province of Che-kiam, and one of the richest in China. It is four leagues in circumference, the streets are full of people, the suburbs very large, and the canals are crowded with a vast number of boats.

The garrison consists of ten thousand men, of whom only three thousand are Chinese, the other seven thousand

sand being Tartars. The water of their canals is not clear, nor are their streets broad; but their ships are neat, and they carry on a considerable merchandize with the different provinces next adjoining to them. A little to the eastward of the city is a river about a mile broad; but a little higher it is only a useless torrent, owing to the different streams which compose it, issuing from among a great number of small rocks. On the west is a lake about six miles in circumference, and in it are a vast number of fresh-water fish. The water is clear, but shallow, yet deep enough to carry some large flat-bottomed boats, in which the young people take their pleasure. In the middle of the lake is an island where there is a small temple, and several pleasure-houses for the young people to regale themselves at.

About four leagues distance from Ham-cheu stands Su-cheu, a city of equal bigness and extent, being likewise about four degrees in circumference. It is the usual residence of a viceroy, and carries on a considerable trade. The vast crowds of people daily seen at the custom-house, would induce a stranger to believe that it is extremely populous, and yet it is not so well inhabited as many other cities of the same size in the empire.

The whole of this province is so well cultivated, that there are towns and cities every-where within sight of each other. Some of these towns and cities are large; others are small; but all of them are so populous, that it is difficult to get through the crowd. The river Kiam, which runs through this province, has several well built towns upon its banks, particularly Yam-cheu, one of the most remarkable cities in the whole empire, and which the Chinese say contains a million of inhabitants. This however is not true; for, upon the closest observations we could make, it did not appear that there were above 50,000 inhabitants. For notwithstanding vast crowds of people were there daily, yet upon enquiry we found that they were no others than such as came from the country, in order to dispose of provisions.

Among the cities and towns in China, there are some in the provinces of Yun-Nan, Quei-Cheum, Quam-si, and Su-Cheum, which pay no tribute to the emperor, nor yield him any obedience; but are governed by their own princes, who exercise an absolute authority over them. They are environed with high mountains and steep rocks, within which are fields and plains of several days journey, full of cities, villages and towns. The Chinese call these mandarins of the country; because, as they think there is no emperor in the world but theirs, so there is no prince or lord but what he makes.

These people can speak the same language with the Chinese; but they have another peculiarly to themselves, and in many things their manners and customs differ; but in their shapes, stature, and complexions, they are alike. They excel the Chinese in courage and valour, for which reason the latter having not been able to subdue them, have contented themselves to suffer them to live in peace within the inclosures of their mountains, and to carry on a free trade with them. It is true, however, that about two years ago, 1744, one of these independent princes was subdued, and brought prisoner to Peking, with all his wives and children. The emperor having examined them separately, ordered them all, except one young boy, to be massacred before his face; but still there are many of them who do not even at present submit to the Chinese government.

We have already spoken of Macoa, which is the most southerly town in the whole Chinese empire; and though the Portuguese made considerable profits by trading to it, yet such was their bigotry and superstition, that they became obnoxious to the Chinese, and lost the fruits of many years labour. It was not sufficient for the Portuguese to send their priests into a country where they themselves only enjoyed a partial toleration, but they went even so far as to attempt setting up the inquisition, which proved their foolishness, and promoted their ruin.

The next sea-port town to Macoa is Canton, a city well known to all those Europeans who trade by sea with the Chinese. It is a large city, walled round, and takes its name from a river running beside it, which is so commodious for shipping, that the largest vessels can go up it. It is to this city that all the English East India ships go when they trade to China; but the mandarins will not suffer any of the passengers to come within the gates, so that they are obliged to purchase their goods in the suburbs.

In the province of Fo-kien is another celebrated sea-port, called Emoni, from an island of that name. Here the largest ships can ride in safety, and may come as near the shore as they please. The trade of this place has been lately much improved, and still continues to encrease. Here the emperor keeps a garrison of seven thousand men, under a Chinese commander, but most of the soldiers are Tartars. The Japanese send their ships here annually, and bring home goods, which they sell to the Dutch, who are the only Europeans that trade with them. One is surprised to see what vast numbers of vessels come into this harbour, and what great multitudes are continually going out; and here it may be necessary to observe, that in exacting custom-house duties, the Chinese measure the ship, without enquiring into the nature of the cargo.

In the more easterly part of China is Nimpo, the entrance into which is difficult for ships of large burthen; the bar at the highest tides not being above fifteen feet. This place, like that already mentioned, carries on a great trade to Japan, it being but a day's sail to Nanguzaki, whither they carry silks, sugar, drugs, and wine, which they exchange for gold, silver, and brass. Nimpo is a city of the first class, but it was much damaged in the wars between the Chinese and the Tartars; yet the walls are still in good condition, the city and suburbs well inhabited, and the garrison pretty numerous. There are many triumphal arches here in memory of victories obtained by the ancient Chinese over the Tartars, but most of them are now falling to decay. They consist of three great arches abreast, built with large marble stones, and the centre one is placed higher than the others. The columns that support them are sometimes round, but more commonly square, but they have no capitals. They are adorned with beautiful figures, and embossed sculptures, wrought loose one within another, flowers carved, and birds flying as it were from the stone, which are considered as real master-pieces of art, and equal to any that are to be met with in China.

With respect to the habits worn by the men in China, many of them are different from others, not only on account of the manners and customs of the provinces where they live, but likewise the difference in men's stations and characters. The men shave their heads all over, except that part next to the neck, where they suffer a small tuft of hair to grow; and they wear on their heads a sort of bonnet or cap, which civility forbids them to pull off. Their bonnets differ according to the season of the year; that which they wear in summer, is thin, and loose, like a cowl, being wide below, and terminating in a point. This is lined with sattin, and the top is covered with a thin mat, which is much esteemed throughout the empire. In riding, they wear a sort of long hair dried, tinged of a reddish colour, so deeply, that the rain may make no impression upon it. This hair grows white upon the legs of cows, in the province of Souchven; and having received this tincture, it is sold at a higher price than the finest silks. In winter they wear a plush cap, bordered with a sable fox-skin, and the rest is of a curious sattin, black or purple, covered with red silk. These caps are extremely handsome, and sell for eight or ten crowns apiece, but they are so shallow that they do not cover the ears.

The mandarins in their families wear upon their bonnets a diamond, or some other precious stone, ill-cut, set in a button of gold curiously wrought. Others

Others have a large piece of stuff, with agate, chrystal, or some such matter. Their habit is long, and has some resemblance to that of a student, but is very cumbersome for men on horseback. It consists of a vest, which reaches to the ground, the skirts of which being folded before, are fastened on the left side with four or five gold or silver buttons. The sleeves are wide towards the shoulder, and grow shorter and shorter, as they descend down to the waist; nor is any thing to be seen of the hands, besides the tops of the fingers. They keep their vests close to their bodies by a broad silken sash, the ends of which reach down to the knees. The Tartars, to distinguish themselves from the Chinese, wear a knife and a fork stuck into a handkerchief, and fastened to the sash, together with several other trifling things. In summer they wear their necks bare, which to an European would appear as bordering upon indecency; but in winter they cover their necks with plush satten, or foxes skins, which makes them appear very well on horseback. Above this they wear a furtout, which covers their bodies all the way down to the feet, and these have much the same appearance as our barristers gowns. The students in the schools wear their gowns very long; but the gentlemen, particularly the Tartars, have them made short.

The under garment in summer is only a single pair of drawers of white taffaty, under a shirt of the same stuff; but in winter their shirts are made of linen, and under them they wear a piece of quilted cotton, or raw silk. They always wear boots; and if any person happens to visit them, and they have not their boots on, the visitor is obliged to wait till they are fetched. This custom belongs entirely to the Tartars, for as they never go to war without boots, so they think it dishonourable to be seen in any other dress. Their boots are not like ours, for they have neither heel nor top; and when they go on a long journey, they are made of firm old leather, or thick, black pinked cotton; but in towns and cities, they usually wear them of satten, with a border of plush or velvet on the knee. The people in office, and those of superior distinction, wear pattens instead of shoes, and they are covered with linen, cotton, or silk. They stick close to the feet, by a border that covers the heel without tying. Their doctors, and other learned men, let their nails grow very long, insomuch that they are sometimes as long as their fingers. Thus they are not only as an ornament, but also as a distinction, that it may be known that they are not connected with mechanical arts, but wholly addicted to the study of the sciences. They likewise suffer their beards to grow, which, in the opinion of the vulgar, creates them much respect, and induces the people to look upon them as more than ordinary beings. Of these customs the Chinese are so fond, that rather than change their habits or dress, they renewed a great and bloody war with the Tartars, and the greater part of them chose rather to lose their heads than their hair. They abhor the dress of the Europeans; but this is not to be wondered at, when we consider that they know so little of strangers.

The peruke so much esteemed by Europeans, they call a fantastical head-dress, proper only upon the stage for an actor who would represent the devil in the shape of a man. They cannot be persuaded that stockings add any grace to the figure of a man's body, merely because their own customs, manners, and dress have been the same from time immemorial. Persons of quality observe all the ceremonies peculiar to their rank in life, or the office they bear in the state, or community; and they never uncover themselves in any company whatever.

It is otherwise with them when in company with their friends in private, for then they give way to ceremony, and enjoy all those pleasures which naturally flow from a union of sentiments. The vulgar transgress all bounds of modesty in this respect, particularly in the southern provinces, where the boat-men are so impudent, that they go along the streets in single

drawers, without shoes, stockings, or any thing else upon them. In the northern provinces they are a little more reserved, which may arise from motives of necessity; because it is more cold there than in the south. In summer many of the commons wear nothing besides a coarse linen frock, dyed blue or black; and in the winter they wear one quilted with cotton, and lined with sheep-skins; but persons of quality line their frocks with ermine, foxes skins, or velvet, according to their choice. The chief and most esteemed colour is sable, which seems peculiar to the modern Chinese, in consequence of their descent from the Tartars; who, of all other people in the world, seem to be the fondest of that colour.

In true politeness, and in the magnificence of their buildings, the Chinese are much inferior to the Europeans; for their architecture is not so beautiful, nor are their apartments constructed upon a proper plan. This is the more surprising, because in many of the fine arts they make considerable progress; nay, some pieces of their workmanship are really admirable. But as there is no effect without a cause, so it may not be improper to attend to what has been written on this subject by those who have had the best opportunity to know; namely, those jesuits who resided so long in this vast empire, that they even knew more of some parts of it than the natives themselves. First, because all the palaces of the mandarins belong to the emperor, and are furnished at the public expence; so that the possessors do not give themselves much trouble concerning them, knowing that their enjoyment of them will end with the expiration of their offices, or at the utmost with their lives. And in general those mandarins are so poor, that they have seldom any thing more to spare, than what is necessary to support their dignity, which is in proportion to their rank.

Secondly, because the custom of the country forbids receiving of visits in any of the inner rooms but only in the *Divan*, which is constructed only for that ceremony. It is a kind of banqueting-house, all open, without any ornaments, except one row of columns of painted or varnished wood. Their beds, which they look upon as the principal ornament of their houses, never come within sight of a stranger; and it would be gross incivility for any person to desire being admitted to the bed-chamber, though he had seen the other parts of the house. All this magnificence may therefore be reduced to cabinets, tables, varnished screens, some pictures, and pieces of white satten, upon which there are written in large characters some short sentences of morality. These ornaments, when properly arranged, are very fine and beautiful.

Varnish is common all over China, and is of such a nature as to take all sorts of colours. They mix flowers of gold and silver with it, and it not only gives a fine lustre to the wood, but it also preserves it from worms, which are very mischievous in that country. No moisture will penetrate into it, nor any scent affect it. It is not a composition, as some have thought, but a gum that distills from a tree like rosin. It resembles pitch or tar, and must be mixed with oil, to make it useful; but it has no smell. On tables and ordinary chairs, they only lay on two or three layers of varnish, which makes it so transparent, that all the veins of the wood are discernible; but if the veins of the wood are to be entirely hidden, then the varnish must be laid over eight or ten times, till it appears like a piece of ice. When the varnish is dry, they paint upon it many figures in gold, silver, or any other colour, and then give it a slight touch of varnish to create a new lustre, after which the whole appears extremely beautiful.

Porcelain is the ordinary furniture of every house; their tables, side-boards, and even their kitchen utensils are made of it; for they eat and drink out of it as the most ordinary vessels. They have large flower-pots of it; and their architects sometimes cover, roof, and pave marble buildings with it. That which is of

most esteem, is of three different colours. First yellow, which, though the earth be very fine, appears more coarse than the others, because that colour will not admit fine polishing. The emperor uses no other in his palace, and will allow no body to have any of it; so that though he has the worst sort, yet as none but himself can have, so none may covet. Secondly, grey, which has abundance of irregular lines in it that cross one another, as if the vessels were stucco'd, or wrought with mosaic work; to this they give a deep varnish, to cover the inequalities, and by a gentle fire it is made regular, and polished. These vessels have a particular beauty, and are much valued by the curious. Thirdly, the whole is ornamented with divers figures of flowers, trees, and birds, which they paint in blue. This is reckoned the most common of all; every person uses it; and it is the same that is sent into Europe. Of this sort, some is but very indifferent, and not equal to that made in Europe; but there are other sorts of it exceeding fine, and amounting to a considerable price. The fineness is discovered by the transparency, which is discernible chiefly about the brims, that are thinner, and by joining together again if it be broke, because that is a certain sign of the hardness, and consequently of the fineness of the matter.

The whiteness is often confounded with the varnish; but as the skilful may discern them asunder by carrying them into the air when they are new, so age will in time make a plain distinction; for the brightness will tarnish, and the whiteness become more and more apparent. The smoothness and fineness consists in the brightness of the varnish, and regularity of the matter. The varnish must not be too thick, because then there will be a crust upon it, and it will shine too much.

The painting is one of the greatest beauties of the porcelain, and the colours most commonly used are red and blue. They have many beautiful reds, but few of them are lively, because the roughness of the matter sucks in the subtle parts of the colour, and therefore blue is more used. Their blue is the finest perhaps in the world; but it is difficult to hit upon the right tincture; so that it be neither too pale, nor too bright. Their designs in painting are rather pretty than elegant; but their figures of men appear monstrous to a stranger, though much esteemed by themselves. They set a great value upon ancient vessels, as well as we, but for different reasons: we value them because they are scarce; and they, because they were made by their ancestors. Our merchants, who visit China, are not permitted to buy their goods from the workmen; so that they cannot tell whether they get the best or not. Besides, they have no opportunity to give directions to have any thing made after a particular pattern, which if they had, we should certainly see many things brought over to Europe, of a more curious nature than any hitherto imported. The emperor and the great men buy up the finest for themselves, and the workmen have but an indifferent price for it.

Paintings are another kind of ornamental furniture of the Chinese; but they do not excel in this art, because they are not curious in perspective, though they apply themselves diligently to the art, and take great delight in it. Most of the paintings hung up in their houses represent either the figures or the actions of their ancestors, if they have been distinguished for any thing grand or virtuous. If the lives of their ancestors do not furnish out any thing of that nature, then they have figures of trees, fowls, beasts, fishes, and sometimes landscapes. But whatever their paintings represent, they have always some moral sentence written underneath, which might be extremely useful to make an impression on the minds of those who consider how applicable it is to the figures represented in the painting.

In their gardens they are still more negligent than in the furniture of their houses, and their fancies in that respect differ much from ours; for, except in places set apart for the burial of the dead, they think

it madness to leave any place uncultivated for use, having but little taste for what Europeans so much esteem. The laws enjoin that the greatest part of the lands be plowed and sown; so that flower-gardens with them are but secondary objects. It is owing to this, that besides having always enough of the fruits of the earth for domestic consumption, they are able every year to export vast quantities to Japan and several other parts. If they were properly skilled in the art of gardening, and knew how to lay out walks to the best advantage, nothing would be able to equal the beauty of their walks, where the oranges and lemons would appear to an advantage, beyond either imagination or description. It must, however, be excepted to what has been here said concerning their neglect of gardens, that this does not extend to those of a higher rank; for the Chinese nobility have, according to their own taste, the finest gardens in the world. Most of these are situated on the banks of rivers; others have canals running through them; and all of them are adorned with pretty summer-houses.

They are extremely fond of fire-works, and very curious in contriving them, especially on the days of their festivals, of which they have many in China. One of these is very remarkable, and is called the Feast of Lanterns. The origin of this feast is very obscure, but the following is the traditional account concerning it, as believed by the vulgar. There was a famous mandarin, who had a most beautiful and accomplished daughter, and one day as she was walking by the side of a river, she fell in and was drowned. The afflicted father, with his family and other persons, ran to the place, and, that they might find her the sooner, caused a great number of lanterns to have lights put in them. All the inhabitants of the place thronged after him with torches; and though they sought all night in vain, yet it much pleased the mandarin to see the willingness of the people to assist and condole with him. The next year the people went again with their lanterns; and so on annually, till at last it became an established custom. Such is the traditional account of the origin of this festival; but the learned men justly observe, that such a trifling occurrence as this could hardly give birth to a national festival. The account they give of it is the following.

China, they say, was governed, about three thousand six hundred years ago, by an emperor named Kio, the last of the first race. He was endowed with all the qualities that can constitute an hero; but the love of women, together with his other debaucheries, made him a monster in every species of guilt. Among many other extravagancies which he was guilty of, he exhausted all his treasures in building a tower of precious stones in memory of one of his concubines, and filled a pool with wine, for himself and three thousand young men to bathe in, after a lascivious manner. The wisest of his courtiers advised him to desist from such practices; but instead of complying, he ordered them all to be put to death. At length he committed a crime that consummated the destruction of himself and family. One day, in the heat of his debaucheries, he complained to his favourite queen, that life was too short, and told her, he should be content to make her eternally happy. The queen answered, that as all the human race are mortal, the only way for him to enjoy perfect happiness, was to forget there were any changes of the season, either of years, or days, or nights. To effect this, she prevailed on him to build a palace, into which the light of the sun should never penetrate. To supply the want of the light of the sun, he ordered a vast number of lanterns to be hung up; and in that place, he and his favourite queen proposed spending their time in such a manner, as not to know when it was either day or night.

After he had been some months shut up in this place, the people, unable to bear the oppressions they laboured under any longer, took up arms, and put themselves

themselves under the direction of a great lord celebrated for his wisdom in private, as well as in public life. As soon as the emperor heard of this conspiracy, he put himself at the head of an army; but his people abandoned him, and he wandered up and down in disgrace, till at last he died for want of common necessaries. In the mean time the people destroyed his palace, and to preserve the memory of such an action, they hung out lanterns in every one of their cities. This custom became annual, and has ever since been the most considerable festival in the empire. It is observed with more solemnity in Ham-cheu than any where else; probably because the circumstance that gave rise to it took place there.

They are so extravagant at the time of this festival, that they give themselves up to all sorts of feasting, gaming, and drunkenness. Every house is hung over in the front with lanterns; and it frequently happens, that in Peking alone they amount to upwards of one hundred millions.

But the greatest piece of magnificence in China, is, when the emperor makes his appearance in public. He never shews himself openly, but in so splendid a manner as to strike the eyes of the beholders with amazement; when he rides out, which is but seldom, he is attended by upwards of five thousand horsemen, and those not of the lower rank, but all persons of fashion, including the lords of his court, with all the great officers of state. In their dresses nothing is to be seen but silks, sattins, gildings, and precious stones. Every thing is splendid and pompous: their arms, the harness of their horses, umbrellas, streamers, and a thousand other badges of royal dignity, every-where sparkle at that time; yet there is nothing more regular than this croud; every one knowing his respective rank; and the head of that man, or at least his fortune lies at stake, who should presume to obstruct the order of the march. Sometimes he goes without the great wall into Tartary, for the diversion of hunting, but is always accompanied by such vast crouds of people, that it is as if he was going to take possession of a new empire. Sometimes the number of those in his retinue amount to fifty thousand, and they are put to many inconveniences, because they cannot encamp, but are obliged to lay out in the fields with their horses, during the night.

In going these journeys, many of the men and horses die; but the emperor makes no account of such things, his horses, as well as his subjects, being almost innumerable. Forty or fifty of the Tartarian princes come to pay their homage to him; some of whom have armies of their own, but they are all his vassals; he frequently gives them his daughters in marriage, and to keep them firm in his interest, he declares himself their protector against the Western Tartars, called Monguls, and those subject to the Russians. When these petty princes attend the emperor, they are treated in the most sumptuous manner, that they may be possessed with some idea of the wealth and grandeur of China.

When he goes to the temple to worship, or to any of his temples for that purpose, he has seldom less than five thousand attendants; and as many of these are most sumptuously dressed, with splendid flags carried before them, the whole has a most magnificent appearance; nor is it less so when he gives audience to foreign ambassadors; for on such occasions the whole empire is ransacked to find out things proper to entertain them.

With respect to language, that of China has no affinity or connection with any of those in Europe, neither in sound, pronunciation, nor in the arrangement of the words. Every thing is mysterious in it, and tho' all the words may be learnt by heart in a few days, yet it requires two or three years to enable a person to speak it, so as to be understood by a native. But besides the singularity of the words, this language has characters of its own to distinguish it from all

others. They do not speak as they write, and the best composition is harsh and barbarous when printed. Their eloquence does not consist in a certain disposition of periods, such as orators affect, without being stuffed with words instead of matter; for instead of such superficial decorations of language, they have many lively and pointed expressions, both in panegyric and satire; noble metaphors, bold but weak comparisons, and abundance of sentences and passages taken from the antients, who are among them greatly esteemed. They express a great many things in a few words; their stile is sometimes close and mysterious, obscure and not continued, for they seldom use necessary particles to illustrate and connect a discourse. The sound of their words is agreeable enough to the ear, especially in the province of Nan-kin, where the accent is more correct than in any other part, for there they pronounce the words in so soft and delicate a manner, that a stranger can hardly understand them.

They never use the letter R, which much molifies their language; yet many of the Chinese, who pretend to speak correctly, draw out their words to such a length, that they appear as so many sentences. They have no fixed alphabet as we have, and often express their surprise that we can deliver our sentiments with the assistance of so small a number of letters. No person can be admitted to any degree in learning, unless he writes fair; so that to those who understand their letters, every composition appears extremely beautiful. Printing, which has not been known in Europe much above three hundred years, is of great antiquity in China; but it differs much from ours.

When any person intends to have a book printed, he employs a person to write it out fairly; and then the printer, who may be more properly called an engraver, glues each leaf upon a smooth table, and with his tool draws the characters so exactly, that they perfectly resemble the original. So that the impression is good or bad, according to the care or negligence of the scribe: for the skill of the engraver is so great, and they are so exact in their work, that if the leaf is properly written, it seldom happens that any faults are committed; and when it is finished, it is impossible to distinguish the print from the writing, if the paper is the same. It is certain this way of printing is much inferior to ours, because the engraved wooden tables are of no manner of use for any other book besides that they were engraved for. The paper used in China is so fine, that many people believe it to be made of silk, but it is not; for it is all made of the juice and rind of the bark of bamboo, which is a tree thicker and stronger than our alder. They throw away the first rind as too hard, but the innermost being whiter and softer, they pound it in fair water, and so compose the matter for the paper, which they make up with frames or moulds, as long or broad as they think proper, as we do here. Some of their leaves are ten or twelve feet long, but their paper is much more transparent than ours. They wash it over with alum, which prevents the ink from sinking into it; and renders it so shining and transparent, that it appears as if varnished over with silver. But for all this, the Chinese paper is not lasting, for dirt soon gets to it; and being made of the bark of a tree, it is almost impossible to preserve it from worms, if care be not taken to beat the books frequently, and expose the leaves to the sun.

Their ink is most excellent, but that of Nan-kin is most valued. They make it up into small sticks, and so sweet-scented, that one would be tempted to keep them, though they should be of no use at all. The sticks are solid, and in colour transparent, being square, about four inches in length, and one in breadth. Some of them are gilded, with figures of dragons, birds, and flowers; and so neatly wrought in moulds, that they appear as firm as if composed of metal. When a person writes, he dips one end of the stick in water, which he rubs gently upon a piece

of marble, and this produces a liquor into which he dips the pen, and writes upon one side of the paper only. It is made of lamp-black, drawn from many different materials, but that which is most esteemed is from the grease of hog's lard. They mix a sort of oil with it to make it sweet, and pleasant odors to suppress the smell of the lard.

The binding of books in China is also very curious, though it falls much short of ours. They neither gild nor labour them on the edges; and the ordinary books are covered with a grey pasteboard, which appears handsome enough to the eye. They bind others as they please, some in sattin, and others in rich silk, flowered with gold and silver. The form of binding is always the same, the difference being only in the materials, which is more or less rich according as the purchaser chuses to be at the expence.

They pretend that they had printing among them above four thousand years ago; but this opinion is not to be wondered at, when we consider that they are very deficient in the knowledge of chronology.

In ancient times the Chinese had many books on moral subjects; but all those were forgotten, and fell into disrepute, when the great philosopher Confucius made his appearance among them. The character and writings of this man are in so much esteem in China, that the latter constitute the basis of their civil and religious government, and his example is held forth as a rule for the moral conduct of all ranks of people. It is therefore incumbent upon us, in duty to the reader, to say something concerning him in this work; for many people have heard of his name, without knowing any thing more concerning him.

Confucius, whom the Chinese call Coum-tse, was born in the province of Quamtuan, in the 37th year of the reign of the emperor Kino, 483 years before Christ's incarnation. His father died before he was born, and therefore he was called Ise; that is, a child of sorrow. While a boy, he took no pleasure in those sports and diversions of which young ones in general are so extremely fond, but had a grave and serious deportment; and discovered signs of the most exemplary piety. He never ate any thing without prostrating himself on the ground, and begging for a blessing on it from the Supreme Lord and Governor of the universe. After the death of his grandfather, he became a disciple to Toem-Sa, a famous doctor of those times, and under him made great proficiency in knowledge, before he was sixteen years old.

When he was a little more advanced in years, he made a collection of the most remarkable sayings and maxims of the ancients, which he intended to lay down as the rule of his conduct, and insil into the minds of the people. Every province was at that time a distinct kingdom, and had a prince of its own, who, though subject to the emperor, governed by his own laws, levied taxes, disposed of all places of trust, and made peace or war when he pleased. These princes happened to have some differences amongst themselves; and the emperor, at the time Confucius was a young man, was afraid of them, because he had not force sufficient to subdue them. Confucius seeing this, and being persuaded the people could never be happy so long as ambition and false policy governed their councils, resolved to preach up a severe morality to each man, to condemn riches and worldly pleasures, and embrace temperance, patience, and other virtues, to inspire them with magnanimity, and a sincerity incapable of the least disguise. His words were seconded by such an example, as produced very beneficial consequences; for kings were governed by his councils, and the people revered him as a saint. Those who would not imitate his conduct, yet commended him; and being chosen to an high office in the kingdom of Lou, in less than three months he brought the people into such a state of subjection, that the neighbouring princes became jealous, as knowing that the kingdom which was so well governed, must flourish, and become powerful.

The king of Tai was more jealous than any of the

rest and therefore, if possible, to put a stop to the proceedings of Confucius, he picked out some of the most beautiful women in his dominions, and sent them along with an ambassador to the king of Lou. This scheme had the desired effect; for the king of Lou and his courtiers forgot all the morality taught them by Confucius, and gave themselves wholly up to pleasure in company with these beautiful women. In vain did the philosopher remonstrate against the irregularity of their conduct; in vain did he represent to them that they were acting beneath the dignity of their characters as men. They lent a deaf ear to all his instructions; which grieved him so much, that he resolved to leave that kingdom, and travel into some other parts, where he should be treated with more respect.

Accordingly he travelled from one province to another, but was treated with so much contempt, that he was often in want of the necessaries of life, and as often in danger of being murdered by those to whom he had given the best of instructions. But none of these things affected him; and he used often to say, that "The cause he defended would prevail, and at last be acknowledged and supported." Many disciples put themselves under his tuition, some of whom he taught to write a fair hand, others to converse on the principles of government; and several he instructed in the highest mysteries of the Chinese religion. One of his maxims was, "That human nature came from heaven pure and perfect, but is corrupted by passion, ignorance, and ill example. To restore it, we must reduce it to its original, and become obedient to reason, which will instruct us to think well, speak discreetly and virtuously; obey heaven, love our neighbours as ourselves, and deny subjection to the conduct of the senses." This seems to have been his leading maxim in theology; and when we attend to it, we shall find that it is at least as pure as any of the doctrines of the philosophers, whether antient or modern.

He sent six hundred of his disciples into different parts of the empire, to reform by their instructions the manners of the people; and such was his zeal to do good, that he once intended to have crossed the seas, and instruct the inhabitants of distant nations. The jesuits tell us, that Confucius prophesied of the birth of a Great Person in the west, who was to reform the whole world, by whom must be meant Jesus Christ; but what truth there is in this, we cannot say; only that almost all heathen nations had some hopes of the coming of such a person. This truly great philosopher lived to a great age; and though his precepts were but too little regarded when living, yet after his death, stately temples were built to his honour. So that notwithstanding any design of his own, he is now become an object of idolatry.

With respect to government, that of China may be considered as in all respects monarchical. They never heard of the name of a republic till they learnt it of the Dutch. And they still wonder how a state can be regularly governed without a king. They look upon a republic to be a monster with many heads, formed by ambitious men in the times of public calamity. And their sentiments are the same with respect to all mixed governments whatever; their laws allow their princes an unbounded authority, upon a supposition that he will use his power with moderation and humanity, to support the dignity of the crown, and promote the interests of the community. The people respect their prince so much, that they almost adore him; his words are oracles; his commands are indisputable; and all that he does or says, is considered as sacred. He is seldom seen, nor can any person be permitted to speak to him, but upon their knees. All his officers of state are obliged to do so; nor is there any distinction made between them and the princes of the blood royal. When he is taken ill, and there is reason to fear that he will die, then the whole court is filled with mandarins, and other dependants, who pray incessantly for his recovery.

This

This indeed is no more than what is consistent with their interest; because every new emperor may turn out of employment all those whose conduct he does not approve of, and put his own favourites into their places.

That this is the true state of the case, will appear evident when we consider that the following particulars are established as law in China; and any person presuming to find fault with them, would be considered as a rebel.

First, All places, whether of trust or honour, are bestowed by the emperor without purchase-money, merit being the only title; but of that merit he is left to be the sole judge. In like manner he is to judge whether the person who has been appointed to any place acts consistent with the nature of his duty; and if any thing in his conduct displeases the emperor, he immediately turns him out of office. Such things frequently occur in China; and it has happened more than once, that a person in high rank has been discarded for wearing a robe, which the emperor considered as superior in elegance to his own.

Secondly, The sovereign has also an unlimited power over the lives, as well as over the offices of his subjects. No viceroy, nor any court throughout the empire, can execute a criminal without express orders from the emperor. They may try and condemn them according to law; but the proceedings must be laid before the emperor, who either confirms or disannuls the sentence according to his will and pleasure; and sometimes he curtails part of the severity of the sentence, by making it less rigorous.

Thirdly, Although every man enjoys his real and personal estates in security, yet the emperor can at any time impose what taxes he pleases; but it seldom happens that he exacts more than is consistent with that duty which every subject in general owes to the state at large. He has likewise the privilege of exempting particular provinces from bearing a share in these necessary burthens; but this indulgence is seldom granted, except when the inhabitants of those provinces have been oppressed by some of the Mongul Tartars, who frequently make inroads amongst them, and strip them of every thing that is valuable. Thus far we learn that the will of the prince comes in the place of law; and the happiness or misery of the people must, in a great measure, be estimated according to his virtues or vices. How far this may be the case under republican governments, we are not now to enquire. The same passions that direct an individual, often direct whole communities; but we may say in the words of Mr. Pope,

“ Whatever is best administer'd, is best.”

Fourthly, The emperor has the sole power of declaring war, or concluding peace. He may make treaties on what condition he pleases; without asking the advice of any of his subjects; but it is generally supposed he will keep the honour of the empire in view. No appeals lay from his judgments; for all his decrees are irrevocable, so that they must be executed according to his mandate.

Fifthly, He has a right to appoint one to succeed him in the regal dignity; and so unlimited is his authority in this matter, that he may even set aside the princes of the blood, and chuse one from among his common subjects. This however seldom takes place in the present age, although it has been practised formerly.

The ancient Chinese emperors considered themselves as the fathers of their people; and therefore as they knew that they were not to live for ever in this world, consequently they looked upon it as an incumbent duty to provide for the security and happiness of their people, after their prince was taken from them. At present, the emperor generally appoints for his successor the son of one of his favourite queens; but though his name may happen to be registered in all the courts of record in Peking, yet the emperor may again re-

voke the appointment, and declare another of the princes of the blood to be his successor. We have many instances of a similar nature in the history of European nations; and it may serve to shew, that however weak at present the feudal law is become, yet it was once universal; and that striking instances of its power are to be met with in several of the eastern nations, and even in China; an instance of which, till very lately, we were in a manner unacquainted with.

Sixthly, Death puts no end to the power the emperor has over his subjects; or, in other words, though any of them die, yet he can reward or punish them; that is, he can confer titles upon them, which shall descend to their children; or he can render them infamous for ever. Sometimes he gives orders for temples to be built to their memory; and if their conduct has been very beneficial to the state, he orders the people to honour them as gods. Undoubtedly this is a most flagrant abuse of religion; but then it must be considered that these people have nothing more than the light of nature to direct them.

Seventhly, The emperor hath power to change the figure and form of their letters, to abolish any characters already received, and to substitute new ones in their room. He may also change the names of provinces, cities, towns, villages, and even families; but this is no more than what has been often done by European princes. He has a power to prohibit the use of such words in conversation as are not agreeable to him, and may introduce a new way both of speaking and writing. One would naturally imagine that this unlimited power granted to the sovereign must at one time or other be perverted to very bad purposes; but it is really not so, for there are laws even in China which dictate prudence to the emperors.

For, First, the old lawgivers have made this a standing maxim of government, that kings are properly the fathers of their people, and not masters placed on the throne to be served by slaves. This maxim is deeply impressed on the minds of the people, being always inculcated by their teachers and philosophers; so that the emperor is, in some measure, obliged to shew himself in most respects worthy of that amiable title.

Secondly, Every mandarin may tell the emperor of his faults, so that he does it with due submission and respect; and if he does not then attend to his conduct, he may put him in mind of it again. And though there have been frequent instances of some of these mandarins suffering much for using such freedom with the emperors, yet the greatest part of the history of China shews, that the sovereigns of that country in general have preferred the good of their people to their own ambition.

Lastly, If a prince has any regard for his character and reputation after death, he will take great care to act consistently with his dignity and duty, in promoting the interest of his people. A certain number of their most learned men are chosen to write down an account of the emperor's actions, and even his words, from day to day; which chronicle is published after his death, and every one is at liberty to make what remarks on it he pleases.

The ordinary form of government which the law prescribes, is the following: The emperor hath two sovereign councils, the first of which is called the Extraordinary Council, and the members of it must be all princes of the blood; no other being permitted to sit in it. The second is called the Ordinary Council, and, besides the princes of the blood, all the great officers of state sit in it. These two councils examine all-officers of state, and make their report to the emperor, from whom they receive their final determination. Under these councils are six courts at Peking, each having different matters assigned them. The first is called Lipou, which presides over the mandarins; and gives or takes away their offices, with the consent of the emperor. Secondly, the Houpou, which takes care of the treasury, and points out the

mode of raising the taxes. Thirdly, Lipo, which is to look after the antient customs; to take care of religion, the arts and sciences, and foreign affairs. Fourthly, The Pimpou, which is a court of war, to take care of the soldiers, and every thing relating to the army. Fifthly, The Himpou, where all criminals are tried; and lastly, The Conpou, which has the care of all the public buildings; such as the emperor's palaces, the temples, the water-works, halls, offices, and scaffolds at public entertainments.

Each province has a lieutenant with a deputy under him, and both are obliged to reside within their own jurisdiction. Each of these lieutenants has a court, where all civil and criminal matters are decided; but his decrees in causes of life and death are not final, till realized by the emperor. Along with each of these vice-roys or lieutenants, are several mandarins, who are in some respect spies on their conduct; and this serves much towards keeping them watchful and steady in the discharge of their duty. For neither favour nor threatening will prevail with these mandarins to wink at the mal-administration of justice; which were they to do, they would be disgraced throughout the whole of the empire, and their families would be ruined. They transmit once every month to the emperor's council an account of what has been done in the province, and how the lieutenant has conducted the public affairs. But, besides all this care, the emperor visits the province in person, to hear the complaints of his subjects, and he does it wholly at his own expence. He gives no notice of his coming either to the mandarins or the lieutenants, in order that they may be continually upon their guard; which is certainly one of the best schemes of civil government that could have been invented.

In the punishment of lesser crimes, such as misdemeanours, the magistrate, if he sees them committed, may cause the criminals to be punished on the spot. Thus, when they see one man assault another, they can order their attendants to give the offender twenty or thirty stripes, according to the nature of the offence; and all this in the open street, without the formality of a trial. But in all trials where the life of the person accused is at stake, then he has time granted him to make his defence, and his trial proceeds in a fair open manner. It is very remarkable, that though China is a large, populous empire, yet there are but few criminals to be found in it, which must be owing to the three following causes. First, the moral principles taught the people in their youth, and frequently repeated in their advanced years. It was said of the Lacedæmonians, that their youth treated the aged with more respect than what was shewn by the youth of any other nation; but this was trifling when compared with the conduct of the Chinese. The people in China have such a sacred regard for the aged, particularly for their parents, that they comfort them under afflictions, visit them when sick, and, as the last mark of their love, bury them in a pompous manner.

No rank or character is exempted from these duties; they are incumbent upon all, and to neglect them would be attended with the greatest disgrace. If a son were to mock his parents, or offer to lay violent hands upon them, the whole empire would be alarmed. In such a case, which seldom happens, the emperor judges the criminal himself; all the magistrates in the town or city where it happened are turned out of employment, for neglecting to curb this diabolical temper, in the beginning; the criminal is chopped into a thousand pieces, and his house is reduced to ashes. The emperors themselves, notwithstanding their sovereign power, would never find rest on their throne, were they to shew any want of respect to their parents, as will appear from the following anecdote, mentioned by Father Le Compte.

“ One of the emperors banished his mother for carrying on an intrigue with one of the lords of the court; and because he knew that this action would

render him obnoxious to his princes and mandarins, he forbade them all under pain of death to admonish him of it. For some time they continued silent, hoping he would condemn himself for his conduct, but finding he did not, they resolved to lay the case before him, whatever might be the consequences. Three, successively, were tortured to death; but at length their heroic constancy so gained upon him, that he repented him of his cruelty. He reflected with concern, that he who was the father of his people, should thus act the part of a cruel unjust tyrant, by putting to death his innocent subjects, for no other reason but that they put him in mind of the duty he owed to his mother. Accordingly he recalled her home, reinstated her in her former honours; and he was honoured by his subjects for doing so.”

Next to their parents, they treat the mandarins with great honour and respect, considering them as the representatives of the emperor. Part of this respect is kept up by the splendid retinues which these officers have at all times to attend them, and partly by their integrity in the administration of justice. When they go out of office in the provinces, which is generally at the end of three years, the people assemble in large bodies together, and stand on each side of the road, for ten miles together or upwards, to testify their respect for their good magistrate. This lays the foundation of honest ambition in the mind of the new appointed governor, who generally imitates the conduct of his predecessor.

Secondly, Their civil government is built on the wisest maxims of sound policy, which contributes much towards the preservation of peace and good order among all ranks of people. One of these maxims is, never to put a mandarin or lieutenant into office in the province where he was brought up, lest he should become partial to his own relations, and for fear those who knew him in his youth might not treat him with proper respect.

All those who are sent to govern provinces, or in any important office distant from the capital, are obliged to leave their children at court, not only that they may be properly educated, but likewise that they may be kept as pledges for the conduct of their fathers. There is no such thing as impressing either seamen or soldiers, for the same army is kept in peace, as in war. This creates respect to the dignity of the emperor, and contributes towards preserving the public peace. Every one who does his duty in a public character, is sure to be rewarded, according to his rank and merit, and all their punishments are in one way or other adequate in proportion to the nature of the crimes committed, but those of an enormous nature are not common.

They reckon it good policy not to suffer a woman to engage in trade, but to keep herself confined within doors, and be continually employed in bringing up their children. So that as they do not visit abroad like our women, neither are they exposed to the same temptations. Great encouragement is given to commerce, and their ships sail once every year to Batavia, Siam, Malacca, Japan, and Manila. But their greatest trade is among themselves, between the inhabitants of one province, and those of another; which, like so many kingdoms, communicate their riches to each other; and this mutual commerce unites the people, and fills their cities with plenty.

It is almost impossible there should be any intrigues between the different sexes; for as the women are kept in the apartments, so none but their husbands are permitted to visit them. Those of a high rank have concubines and nurses, others have nurses only, who act the part of domestics; but the lower sort, who have not above two or three wives, are obliged to let the one wait on the other. Nor is courtship known in China, for a man never sees the woman he is to marry till she is brought to him. Their mothers, or some old woman employed by them, make up all their matches, and they generally represent the bride as possessing more qualifications than she really does.

Many

Many of the men purchase their wives in the same manner as they do other merchandises; giving more or less for them, according to their good or bad qualities. The parties being agreed, and the money paid down, preparations are made on both sides for the marriage solemnity.

The bride is carried in a sumptuous chair, preceded by drums, trumpets, hautboys, and other sorts of music, and the parents and relations follow behind. Her portion, which she carries along with her, is only a few cloaths, and some articles of household furniture, with which her father presents her. The bridegroom stands at the door to receive her, and having opened the sedan, leads her into the women's apartment, who spend the remainder of the day in feasting, while he does the same with the men. This sometimes proves a day of sorrow both to the bride and the bridegroom; for when he finds himself imposed on by a false account of the bride, he chuses rather to lose the purchase-money, than to take her as a wife. Husbands and wives are not to be separated or divorced in any case whatever, except adultery; which, as it is in a manner impossible, so it seldom happens: when it does, the man who seduces the woman is scourged in the most severe manner; but the woman is sold, and, with the price paid for her, the injured husband purchases another.

There are upwards of one hundred persons employed by the emperor to regulate the calendar every year, that the people may know how to distinguish holy days from others. They make the year to consist of thirteen months, according to the course of the moon, which causes some alterations to be made from time to time. Antiently they divided every day into ninety-six equal parts; but at present, in consequence of the instructions given them by the jesuits, they divide it into twenty-four parts, in the same manner as in Europe. As for the ordinary people, all they mind of time is the rising and setting of the sun and moon. In the villages they have bells, which they tinkle in the night when they are alarmed at any thing, or when one neighbour wants the assistance of another. But in every city and town there are two towers, in one of which is a bell, and in the other a drum. The bell is rung, and the drum beat, five times every night, which they call so many watches; and without the assistance of clocks, they have such a regular way of counting, or rather guessing the time, that they are seldom mistaken.

The Chinese coin is very odd, nor is there, perhaps, any thing like it in the world, unless it be in Japan, or some such parts.

They have round pieces of copper with hieroglyphicks engraved on them, and a hole in the middle; but the metal is not pure, nor are the characters well stamped. They are thick, but easily broken; and their value does not exceed that of a farthing. They reckon their money by crowns, which are in value equal to six shillings and six-pence with us; but these pieces have no figure of the emperor upon them; and any person who has doubts concerning the value, may cut them in pieces. In general all their coin is valued by weight, which, perhaps, is the best method that can be thought of; for most of the pieces are so clumsy and irregular in their shapes, that every person cannot judge properly of them. They buy almost every thing by weight, and that is the reason why those who have occasion to go to markets, carry scales and weights along with them; but all these must be marked by proper officers appointed for that purpose; and so exact are they, that the thousandth part of a crown will instantly turn the scale. They have but little gold coined amongst them; and the reason is, the greatest part of that metal is used in ornaments for their dresses. They divide the pound into sixteen equal parts, like our ounces, and each of these into ten equal parts, and each of these again into ten smaller parts, and so on till they come to grains.

The civil government of China takes notice that

buildings be kept in proper repair; and whether there are rivers or brooks, neat stone bridges are built over them. The canals which convey their water to the cities and towns, are all paved with free-stone; and a bank raised above the surface, to prevent passengers from being accidentally drowned. In marshy grounds they throw up prodigious large banks, which keep the roads very dry, and all this is done at the expence of government. Some of their highways are cut through mountains, which appear terrible to strangers; but the people of the country are accustomed to them. Most of their roads are eighty feet broad, and the soil being light, they are soon dry after the rain. In some provinces, they have on both sides causeways for foot passengers, with rows of trees growing near, which makes it very refreshing in summer. Each of these roads terminates in a city or town, and there are wooden pillars fixed up at half a mile distance from each other, with large letters on the upper part, which tell the traveller how far he is from the town he left last, and how far from that to which he designs to go; so that if they can read, they have no occasion for any one to direct them.

That the roads may be kept free from robbers, parties of militia are stationed at short distances from each other. Their business is to convey letters from one town to another, to protect passengers, stop every suspicious person, and alarm the country in case of the approach of an enemy. Every man whom they find going armed is stopped and taken to the next town, where he is obliged to give an account of himself.

Of all the equitable institutions in China, the method of collecting the public revenue is most commendable. They are not pestered with swarms of officers as we are; but all the landed estates are surveyed and measured, and all the rich inhabitants are registered. When a tax is laid upon any sort of goods, it is publickly known; and, instead of hiring officers to collect it, the people must bring it to the mandarin of the place. All their names being known, there is no difficulty in ascertaining who has paid, and who has not; and if a person neglects to send in his share, the mandarin orders him to be bastinadoed till he has made good his payment. Though the revenues of this empire are the greatest in the universe, yet the southern provinces alone could pay it; but such is the equity of the government, that all are taxed according to their riches, and the nature of their several employments.

The numerous army kept in pay by the emperor of China, one would imagine, was sufficient to subdue all Asia; but their natural effeminacy, and continual idleness, are such, that they are but very little valued.

The Western Tartars despise them so much, that they say in derision, "That the neighing of a Tartary horse will rout all the Chinese cavalry." And yet all possible care is taken to have good soldiers; for none are admitted to be officers, till trial has been made of their skill in military affairs. These officers exercise their troops, form them into squadrons, march them from place to place, teach them to divide the files, to go through narrow passes, shew them the way of attacking an enemy, and how to rally when put in disorder.

Although they know the use of fire arms, yet they take more pleasure in the bow and the scymitar, because they have seldom any enemy to oppose, except the Tartars. But notwithstanding all the trouble used in training them up to military discipline, yet they are soon broke, because they have no principles of honour instilled into them; so that they live continually at ease, hoping there will never be occasion for them to fight. It is certain, that this piece of Chinese police prevents domestic insurrections, but it exposes the whole empire to be invaded by any foreign enemy.

Though the Chinese are now idolators, yet they have not been always so; for it appears probable, that

part

part of this vast empire was peopled by the descendants of Noah, soon after the deluge. We read in Genesis, (chapter xi.) that the descendants of Noah were very numerous at the time when the Tower of Babel was built, and the confusion of languages which happened obliged them to scatter themselves into different parts of the universe. There is no doubt but these men continued many years after to worship the same God; but in all nations we find idolatry gaining ground, till at last it was firmly established, except among the Jews. The most learned men in China allow, that before superstition was introduced with the god Foe, there were neither idols nor statues to be seen; for the people worshipped the invisible God of Heaven and Earth, and regulated their conduct by the maxims of the Emperor Tyao. It is said that this purity of religion continued near three hundred years, till at last some strangers introduced images, in the form of some they had seen in their own countries. But whatever truth may be in that, the Chinese are at present gross idolators, having many temples, and gods to whom they offer up sacrifices, particularly of swine's flesh.

Their notions of the attributes of those idols whom they worship, are the most unworthy that any human being can form. When they pray to them, and their requests are not complied with, they treat them in the most reproachful manner, turn them out of doors, and kick them about in the streets.

Le Compte tells us of a man whose only daughter had been long ill, and he prayed and sacrificed to an idol in order to procure her recovery. One of the bonzes or priests made him believe that she would recover; but he was mistaken, for she died. The father was so much enraged, that he went to the lieutenant of the province, and procured an order to have the temple pulled down, and the idol broken to pieces; all which was executed.

They believe in the doctrine of transmigration of souls; namely, That as soon as a man dies, his soul goes into another body; those of the wicked into the meanest reptiles; but the righteous into men of a higher station than the body they formerly inhabited. Besides the bonzes, who are the priests of the ancient Chinese, there is another sort called Lamas, who were brought in by the Tartars, and at Peking are chaplains to the Tartarian nobility. Their habit is the same as that of the bonzes, and their religion is nearly the same, all the difference consisting in the use of a few ceremonies.

About the middle of the sixteenth century, St. Francis Xavier, a jesuit, went into China, and laid down what he believed would be a good plan for the conversion of the heathens. Several of his brethren followed him, till at last there were upwards of two hundred of them. The emperor permitted them to build themselves churches; and they made some few converts, but most of them relapsed into idolatry. Nothing but the wildest enthusiasm could ever have induced the jesuits to imagine they could propagate popery in China; for it appears, that in the service of the mass there are more ceremonies used than in the Chinese pagan temples. To this we may add, that their prayers being read in an unknown tongue, those converts did not understand the meaning of the words they repeated. At present there are no jesuits permitted to visit China; for they were so zealous to propagate their tenets, that they entered into disputes with the bonzes; and this giving great offence, they were all banished, and their churches pulled down; and so little impressions had their notions made upon the minds of their people, that they all relapsed into idolatry as soon as these fathers had left them. We are, however, under many and lasting obligations to those fathers for their indefatigable inquiries into every thing relating to this vast extensive empire. The Europeans knew little of it at that time, but the jesuits penetrated into every province; and being men of learning, they were able to give a proper account of every thing they saw. As they taught the Chinese

many useful arts, so for a considerable time they were treated with great respect; and the emperor often sent and conversed with them. As every popish priest takes an opportunity of speaking of religion to those who differ from them, whether Heathens, Mahometans, or Protestants; so one day while Le Compte was in conversation with the emperor, the latter proposed the following objections to the truth of the Christian religion. "If the knowledge of Jesus Christ be absolutely necessary to salvation, and God desires that all men should be saved through him, how happens it, for these sixteen hundred years, we in China know nothing of it? Is China so inconsiderable as not to be thought of, while so many barbarous nations have been enlightened?" To this objection the jesuit answered, that China had not been forgotten in the commission given to the apostles to instruct all nations; and in proof that St. Thomas, and another of the apostles preached in China, he quoted the following passage from their history. "In those times (that is, about the age of the apostles) a man came into China, and preached heavenly doctrines. He was not an ordinary man, for his life, miracles, and virtues, made him admired by all the world." We shall not take upon us to say what truth there is in St. Thomas ever having been in the empire of China, or in any part of the East Indies; but be that as it will, the emperor's objections fall to the ground, when we consider that there were many flourishing churches in nations where the inhabitants are now either Heathens or Mahometans.

As the jesuits will not give up any of their notions, so they taught the Chinese that they could work miracles. Father Faber, a zealous jesuit, having taught the doctrine of miracles, it happened that a district in one of the provinces was infested by vast swarms of locusts. The people waited upon the jesuit, and begged he would destroy those pestilential vermin, seeing he had the power to work miracles. The father laid hold of this opportunity of preaching to them, telling them that if they would believe the gospel, he would not only destroy the locusts, but would give them an assurance of eternal life. They promised they would, upon which he told them they must fast and pray several weeks, for he knew that about that time the locusts would die of themselves. Accordingly, when he was certain the time was come that they would be destroyed by the severity of the weather, he called the people together, and having dressed himself in his robes, went out into the fields, and having pronounced the sentence of excommunication, he sprinkled the ground with holy water, and next day all the locusts were found dead. Next year however the locusts returned, and as the Jesuits would not comply with the requests of the people in destroying them, before they had made any progress in destroying the fruits of the earth, they all forsook popery, and relapsed into idolatry. Such were the effects attending the jesuits professing to work miracles. They knew it was not in their power to change the course of nature; but they were foolish enough to pretend to do it. And from this circumstance we may learn, that even the greatest politicians are, in some things, the greatest fools. We shall conclude this account of China by drawing a few reflections from what has been already advanced. And, First, It is surprising to find such a vast empire well inhabited, and furnished with all the necessaries of life, so little known to the rest of the world. This however will be accounted for, when we consider that our merchants, who trade to China, have nothing in view besides the acquiring riches; so that they never give themselves any trouble to inquire into the manners and customs of a people with whom it would be no dishonour to be connected. Strange that such an opulent company as that of the merchants trading to the East Indies should not seek to enlarge the human understanding in the same manner as they do commerce! It is well known that this might be done by sending a few valuable presents to some of the great

ASIA,

agreeable to the most approved

MAPS and CHARTS,

HABITS of DAGESTAN TARTARS of TARCU,
on the borders of Persia.

men in the southern provinces of China. These presents being delivered in a graceful manner, would do more towards opening a communication between these people and ourselves in Europe, than any thing that has been hitherto attended to. If they would be prevailed upon to send two or three of their sons over to this part of the world, to learn our laws, manners and customs, and after being treated with friendship, conduct them home adorned with all those accomplishments which could be acquired, they would, by their conversation with their friends, remove from the minds of their countrymen those unhappy prejudices they labour under.

Secondly, As the Russian empire is apparently rising up to a state of greatness, so to facilitate a communication between Europe and China; it would be much for the interest of the empress, and for the dignity of the king of Great Britain, that the Chinese should be invited to keep an ambassador constantly residing at the court of Petersburg, whose curiosity might in time lead him to visit London.

Thus a communication might be insensibly as it were brought about. The Grecian language, at present much cultivated in England, would be of great service to answer these valuable purposes; and at last the Chinese would begin to emerge from their present obscurity, and court an alliance with European powers.

Thirdly, As we have already seen how ridiculous the jesuits have made themselves in pretending to work miracles, let us endeavour to learn wisdom by their misconduct. If it should ever happen that a communication could be opened between Great Britain and China, so as to enter into conversation in a friendly manner, let us not pretend to do what is not in our power; but let us tell them, that we make no pretensions whatever to the power of working miracles;

for although we are firmly persuaded that miracles were wrought in the first ages of Christianity, yet they ceased as soon as the necessity for them was removed. The Romish priests never make a more awkward figure than when they pretend to work miracles; and the reason is obvious, for they know they have not the power to do so; and wherever they inculcate such notions among the common people, they will find that some of them will be bold enough to call upon them for an exertion of their abilities, perhaps when they little expect it.

Lastly, We could wish that in the ordinary course of reading history, young persons would not neglect that of China. It is surprising to think how, and in what manner, history points out a similarity between the inhabitants of all the nations of the world, either in antient or modern times. In their manners and customs, the Chinese have so many things in common with the antient Egyptians, that many have imagined the former was a colony of the latter, who left their native country at a period of time when they were oppressed by some tyrant, whose name has not been transmitted to us. This, however, is really a vain conjecture; for with greater reason might we assert that the savages in America are descended, from the ancient Carthaginians, because both used the custom of scalping their prisoners. Many things of a similar nature might be mentioned; but we shall conclude this article by advising such of our officers, as captains of ships, and other men of abilities who visit China, to endeavour to bring us better accounts than they have hitherto done. This will habituate them to an acquaintance with the place; and by an insinuating, engaging behaviour, they may probably learn even more than they could have reasonably expected, considering the discouragements they laboured under.

TRAVELS THROUGH TIBET, WESTERN TARTARY, KARAZM, AND BUKHARIAS.

By Thevenot, Kircher, Duhalde, Gruebar, Dorvile, &c.

THIS country, which the Europeans call Tibet, or Thibet, has many different names among the Orientalists, and so have all other countries in that part of the world; for it is our misfortune, or rather it is owing to their quickness of expression, that we do not rightly attend to what they say. Tibet is situated on the west of China; and is in length from east to west one thousand seven hundred and thirty miles; but in breadth it is very irregular, being above seven hundred miles in some places, and not above two hundred in others. It is bounded on the north by the country of Koko-Nor, and a vast sandy desert which separates it from Little Bukharia; on the east it has the empire of China; on the west by the Mongul's empire, or Hindostan, with Great Bukharia; and on the south part of the same territories, it is divided into the Lesser and Greater Tibet, the first of which is called by the natives Belâdistân, and the second Bûtân.

Little Tibet lies to the northward of Kashmir, the most northern province of the Monguls empire, and most of the inhabitants are Mahometans. In the year 1664, they were tributary to the great Mogul; but a disunion having arisen concerning the right of succession, one of the pretenders to the crown applied seemingly for assistance to the governor of Kash-

mir, who, by the Mongul's orders, gave him the most powerful succours he could afford; and having assisted him in subduing and putting to death all his competitors, left him in peaceable possession of the regal dignity, upon condition of his enlarging his annual tribute to the emperor, that is to him whom we commonly call the Great Mogul.

The petty prince waited upon Aureng-Zeb, when he was in Kashmir, and brought along with him a present of crystal, musk, and wool; but he had so few attendants, that a Spanish gentleman who happened to be there at the time took him for a country peasant. Bernier was at that time in the service of a nobleman making the tour of the Mogul empire, and being or an inquisitive temper, he invited this petty prince to dine with him. After dinner he asked him several questions concerning his kingdom; and received for answer, that it was bounded on the east by Great Tibet, and that it joined to Kashmir. He added, that it was in length about three hundred miles, and one hundred in breadth; and although it afforded some chrystal, musk and wool, yet it was in general barren, and his subjects extremely poor. He said they had some fruits, but that was only in the summer; for their winters were so cold, owing to the great storms

of snow, that it was in a manner impossible to preserve such ripe fruit as had been gathered.

“ We went (says Bernier) to Eskerdu, the capital of Little Tibet, which is situated about eight days journey from the borders of the province of Kashmir. In this town or city we met with nothing that seemed remarkable. The houses have only a ground floor; and their mosques, which they would not permit us to enter, seemed but very contemptible edifices. The mountain upon which this city is built, induced us to believe that we should enjoy the benefit of a vast extensive prospect; but we were disappointed; for there were so many rising grounds to intercept our view, that we scarce saw any thing worth notice. A river runs near the city; and, winding in a serpentine form round the mountain, divides itself into several branches, in a large valley below. The water of this river is considered as medicinal, and persons of all ranks from most parts of the country come to drink of it.”

The same author tells us, that there are several forests in Little Tibet, well stored with all sorts of game, the prince and his subjects being much addicted to hunting. Father Duhalde, the jesuit, with several others of the same order, were the first persons who ever gave a proper account of this country called Tibet, even to the Chinese themselves. As if these fathers had thought no hardship too great, so that they could ingratiate themselves into the favour of the Chinese, they undertook a journey across this vast country; for though it is sometimes known altogether by the general name of Tibet, yet it is divided into many lesser kingdoms; of which we shall give an account in the words of the jesuits themselves.

“ We entered this country (says Duhalde) at the borders of China, and learned that the territories we were then in were called Great Tibet, to distinguish them from a lesser kingdom of the same name. The first place we arrived at, was a most dreadful lofty mountain, covered all over with snow; and this was in seventeen days after we had joined a caravan, that was travelling into those parts. In seventeen days more we arrived at Ladak, a fortress, where the kings of the country resided; but here we met with very little worth notice.

The weather was then extremely cold, it being in the midst of winter, but we were obliged to travel in that season for the benefit of the caravans. A merchant, a native of the place, told us, that the whole kingdom of Great Tibet is, in comparison of Persia, the kingdom he came from, a most miserable, frozen desert.

The people speak a sort of broken Persian, part of which we understood; so that we were able to hold a conversation with them. The first we met with among them were Mahometans; but they were extremely ignorant, and knew but little of the principles of the religion they professed. They were all dressed in coarse woollen frocks, or gowns, with short boots, and fur caps on their heads. But though they were poor, yet they treated us with the greatest civility, and shewed no rudeness in their behaviour. Their mosques were little better than cottages, nor did it appear to us that any of them understood letters; their whole worship consisting in a few rites and ceremonies. We asked them whether they drank wine? and the answer we received was, that there was so little of that liquor to be met with in the country, that there was no great fear of their breaking the laws of the holy prophet.

Proceeding about an hundred and fifty miles farther into the country, we met with many difficulties in crossing rivers and climbing mountains; and there we found the people gross, illiterate heathens. They had several idols, which they shewed us, to whom they offered up sacrifices; and, what is very remarkable, they have one god, whom they call Urglien, and they believe that he was once both god and man, without father or mother, but born of a flower, about seven hundred years ago. On conversing farther with them concerning this remarkable idol, we found

he was the same with the famous god of the Siamese, called Sommonocodom; who this extraordinary person was, we are not now able to determine, but the fable concerning him seems to have been originally founded upon some part of the scripture history; yet so grossly mangled to serve the purpose of superstition; that little sense can be made of it. In all their temples dedicated to this idol; they have the statue of a woman with a flower in her hand, which answers exactly to the account we have of the mother of Sommonocodom; who conceived him on the flower, floating in the midst of a river.

They use a set of beads in their worship, make no distinctions with respect to meats or drinks, believe in the transmigration of the human soul, and will not allow of polygamy, as is common in most of the eastern nations. Their priests, called lamas, wear a habit different from the common people, and their hair hangs loose over their ears or necks, nor do they wear ear-rings. Their employment is to read and study the books of their law, written in a language and character which the vulgar do not understand; and they recite their prayers much in the same manner as they do in the churches of the Roman Catholics; namely, by singing them alternately with the people. They perform all the public religious duties, and are held in great veneration, living separately from the rest of the people in a sort of convents, built on purpose for them. They have superiors, like our bishops; and over the whole body is one who acts the part of an archbishop, or patriarch, whom the king himself treats with the greatest respect. In all cases of difficulty at the court of Bûtûn, these Patriarchs are consulted, and much regard is paid to their advice, because they are, for the most part, men of age and experience.

At Bûtûn, in 1715, we had an opportunity of conversing with the prince of the country, whose name was Nima-Nanyal. He received us with great good nature, tho' with some degree of formality; for we were obliged to wait till his chief minister introduced us, and then we found his majesty seated on his throne. Next day he invited us to dinner, and we conversed with him till towards evening. He had never heard of the Christian religion, any farther than what some of his Mahometan subjects had told him; namely, that there had been once a great prophet, called Jesus Christ, who, for several years, had many followers; but they had at last become so degenerate, that they were not known in the world, except in some few parts. We told him the whole account of our Saviour and his disciples, with which he appeared to be entertained; and in four days afterwards he sent us another invitation to dine with him; and then he treated us with more familiarity than before. We did every thing we could to entertain him, and related to him an account of the most material passages in the state of Europe, all which pleased him exceedingly; and when we left the place, he conducted us out of town.

In 1664, the king of Great Tibet, knowing that Aureng-Zeb was at Kashmir, and threatened him with a war, sent an ambassador, with presents of musk, chrystal, and fine white cows tails, which, by way of ornament, are fastened to the ears of elephants; that creature being much regarded in the Mogul Empire. This ambassador's train consisted of about fifteen or sixteen persons, all tall men, but poor meager looking creatures, with whiskers instead of beards, like the Chinese. On their heads they wore red bonnets, and a few of them had swords; but the rest marched behind the ambassador, without any sort of arms whatever. He promised the Great Mogul, in his master's name, that a mosque should be built in his capital; that his coin for the future should bear on one side the figure of Aureng-Zeb and his successors; and that for the future he would become a tributary to the Great Mogul. However, no sooner was the emperor Aureng-Zeb returned home, than the king of Tibet broke his word, asserted his independency,

and even to this day the people of this country are in some measure free; being almost in the same situation with respect to the Mogul Empire, as the Tartars are to the Russians, living by plunder; and paying but little regard to government.

Another division of Tibet is called the kingdom of Lassa, and the missionaries have given us the following account of it. It is bounded on the south by vast chains of mountains covered with snow; and no less difficult to pass than those which secure Great Tibet on the west; the torrents that separate them being passed over on planks; laid on ropes stretched across. On the west lies Great Tibet; on the north a great sandy desert; and on the east, several small provinces, bordering on China. The capital city of this kingdom, is called Tonker, and is situated at the foot of the mountain Putala, near the confluence of a small river with the Kaltyú, which falls into the Isanpú, about thirty miles to the south-south-west. There is a spacious temple in this city; but besides that, it has nothing remarkable in it. Duhalde says, that in conversation with a Chinese ambassador, he learned, that in the river there was a small island, on which was the residence of the high priest, or grand lama, whose temple was seven stories high, in the uppermost of which he lived; and near the sides of it were the ruins of an ancient city, destroyed by Kushi Han, king of the Eluths, about the middle of the last century.

“ The inhabitants of this country (says the jesuit) are strong and well made, but their noses and faces are somewhat black and flat, or rather of a cream colour; and their women are bigger than the men, but much afflicted with swellings in their throat. In summer both sexes wear large pieces of suttian or thin hempen cloth round their bodies; and in winter, a thick garment like felt, and on their heads they have a bonnet adorned with boars' teeth, and feathers of various fowls. The richer sort have necklaces of coral or amber; and all the women wear bracelets upon their left arms, from the wrist up to the elbow. Both men and women wear about their necks a piece of silk twist, at the end of which hangs a large bead of amber or crystal, and sometimes a boar's tooth, which dangles upon their breasts; and on the left sides their girdles are fastened with buttons of the same materials. The courtiers, though to all appearance extremely poor, yet are very expensive in their dress, which consists of cloth of gold, and the richest brocade; and as they have none of these things in their own country, so we find that they purchase them from the Chinese, giving in exchange the merchandise their own produce. Some of the men wear a habit in all respects resembling that of the women, only that the upper part of their garment is red, after the manner of their lamas, or priests. But notwithstanding all this finery, they are a very slothful people: many of them eat raw flesh, which seems to be peculiar to the Tartars, and neither the men nor the women wear shirts; and they seldom wash their hands or faces. They are courteous and affable to strangers. The women are not confined as in China; they are permitted to walk the streets as well as the men; but such of them as we saw, were very frightful figures. They differ greatly from most other people in the east, in relation to their marriages; for the restriction laid upon the men is greater than upon the women. It is true, the men are allowed a plurality of wives; but in this they are severely restricted with respect to consanguinity; none being permitted to marry within a certain degree of kindred. It is otherwise with the women, who may have as many husbands as they please, so that they are not the relations of each other; and these husbands have the women in common among them; only the first who cohabits with a woman, is considered as father of the children. When the lamas are reproached for this custom, which they make an article in their religion, they apologize for it by the scarcity of women, which prevails both in Tibet and throughout all Tartary, where the males are the most

numerous; but this excuse we found trifling; for throughout all those parts we visited; we found, either by our own observation; or from the best accounts we could procure; that the sexes were as equal in number as they are in any part of Europe.

It was with much difficulty that we could acquire a little knowledge of their language; for it is different both from the Chinese and the Persian. The Bûtûn character is much used in the east, and consists of only four vowels, twenty simple consonants, ten double letters, and ninety-six compound characters, such as are animated by their vowels. In many parts of this country the soil is good, abounding with rice, corn, pulse, and wine; and their trade is chiefly with the inhabitants of Bengal. The chief commodities in which they trade, are musk, rhubarb, worm-seed, and furs; and here the rhubarb is reckoned the best in the world. It is a root which they cut in pieces, of which stringing ten or twelve together, they hang them up to dry. As the wet spoils it, the merchant runs great hazard in bringing it to market, for vast showers of rain fall in that country. What they call worm-seed grows in the fields, and must die before it can be gathered. But the greatest hardship is, that before the seed is ripe, the wind disperses above one-half of it, and that is the reason why it is so scarce. When they gather it, they take two little hampers; and as they go along, move them from the right to the left, and back again, as if they were mowing the herb, which they bend at the top, and thus all the seeds fall into the baskets. Had the natives the same art of killing martins as the Russians have, they might carry on a considerable trade with the fur of those animals; but with that they are at present utterly unacquainted. A duty of twenty-five *per cent.* is imposed by the Great Mogul upon all goods which the merchants of Tibet bring through his territories, but sometimes it is reduced to eight or ten. When the officer at the custom-house refuses to do so, then the merchants return, and come by another way through vast forests, where thousands of elephants are continually grazing. Their women are in some respects very ingenious artists, and in the absence of their husbands they make pretty toys of coral and amber, which they sell to strangers at a considerable advantage. They have abundance of silver-coined, which induced us to believe that they have some mines of that ore in their country; but they either could not, or would not, give us any information concerning them. As for gold, they have none but what they get in exchange for goods from the merchants in Bengal, or some other provinces with which they trade. In their religious ceremonies, we found those who were heathens to have a very near affinity with the Chinese; and at first we could not help thinking we had discovered sufficient evidences of the Christian religion having been once established in this country. First, the dress of the lamas seemed to resemble what we are told the apostles wore. Secondly, their subordination, which has a near affinity with our hierarchy. Thirdly, a resemblance between some of their ceremonies and those of the catholic church. Fourthly, their notion of an incarnation. Fifthly, their maxims of morality. However, upon mature deliberation, we found that nothing could be inferred from these similarities, any further than they pointed out to us, that there is, and always has been, some form of religion in every nation in the universe. The apostles undoubtedly dressed according to the fashion of the country in which they happened to reside, so that there were no indecencies in the garments worn by them; which was too often the case among the heathens; and as for subordination, it is to be found among Mahometans as well as in the catholic church, or among those pagans just mentioned.

Such are the reflections which Duhalde, and some other missionaries draw from this similarity; but Gruebar, another jesuit, gives a scope to his enthusiasm, and carries it much farther. He says, that their arch-lama has the same power among these heathens, as the pope has over the Roman catholics. Secondly,
Both

Both use holy water in all their acts of devotion. Thirdly, They both pray for the dead; and lastly, their dress is the same in which the apostles are represented in antient paintings. Here the jesuit was much mistaken with respect to paintings; for, so far as we know, there are none in the world so old as the apostolic age.

The same jesuit adds, that in all essential points the religion of those people has such a striking resemblance to that of the church of Rome, that he could not help thinking the gospel had been once established amongst them. Thus (says he) they have a feast resembling our sacrifice of the mass; they give extreme unction; bless the people in marriage; pray for the dead; make processions in honour of their saints; worship the relics of idols (he should have said saints); have monasteries and nunneries; sing the service like the catholic priests; observe divine fasts during the year; undergo several penances, such as whippings; send out missionaries, who live in extreme poverty, and travel barefooted into China. These things, adds Gruebar, I was an eye-witness of. We have already seen that these jesuits are confuted, in their ridiculous comparisons, by some of their wiser and more sober brethren; nor indeed are such comparisons much to their honour; for instead of its proving that these heathens were once Christians, it will rather serve to point out that the Roman Catholics have borrowed many rites and ceremonies from the heathens, amongst whom there was in many respects a striking uniformity.

All the princes or kings in the different provinces of Tibet are more or less subject to the emperor of China; at least they are so in name; for although they sometimes pay him a small tribute, yet they very frequently make his subjects pay double for it; it being their constant practice to plunder the Chinese, as often as they can find an opportunity. When the emperor of China sends an ambassador to Lassa, or any other of the provinces of Tibet, the country people are obliged to furnish him with horses for himself and attendants at the end of every stage; and conduct him to the next, till he arrives at the capital. All sorts of provisions must be furnished him, and he generally returns home as soon as he has received the tribute. In the same manner the emperor maintains the ambassadors from the princes of Tibet when they come to China, and he entertains them in the most splendid manner in Peking.

The king of Lassa is constantly attended by a guard of seven or eight thousand men, armed with bows and arrows; but some of them wear swords and bucklers. There are always fifty elephants kept about the palace, and twenty-two camels, each having a piece of ordnance on his back, that carries a half-pound ball, and a gunner sits behind to manage it. No person is permitted to stir out of the kingdom with any sort of fire-arms, except by permission from the king, or the governor of the province where he resides. These people asserted to the jesuits, that they knew the use of fire-arms, and even heavy artillery, above five hundred years ago; which is long before they were known in Europe. This tale, told by the jesuits, seems to be a gross imposition on the public; for it is generally acknowledged that the Chinese, the most polite people in the east, and best acquainted with the arts and sciences, knew nothing of gunpowder, or the use of fire-arms, till those fathers taught them. How far in doing so they acted consistent with their duty as Europeans, must be left to the reader to judge. Had they not taught the Chinese and other eastern nations the art of making gunpowder, and the use of fire-arms, we might by this time have been much better acquainted with them than we are.

There is no sovereign in the world more learned and respected by his subjects than the king of Lassa, or Bûtûn, being in a manner adored by them. When he sits to give audience or do justice, they all hold their hands close together, above their foreheads; and before they approach the throne, they prostrate them-

selves upon the ground, not daring to lift up their heads. In this humble posture they make their requests known to him; and when they retire, go backwards, till they are out of his sight. When he rides along the streets on an elephant, they spread their cloaths on the ground, and in that manner conduct him wherever he goes.

Another body of people in this extensive country are called the Si-fan, or Tu-fan, a nation formerly in great repute, having several kingdoms tributary to them. Duhalde, and the other jesuits, have given us the following accounts of them. In the 7th century of the Christian æra, Ki-tsung, king of Tu-fan, courted an alliance with Kay-tsung the renowned emperor of the Tang dynasty, and sent an embassy to that prince; which having been received with great marks of distinction, he, by a second, demanded a princess of the imperial blood for his son Long-tsung. The emperor's council looking upon this as a very bold proposal, treated it with some marks of disdain.

Soon after this, Long-tsung succeeded to the throne on the death of his father, and marched with an army of two hundred thousand men to demand the princess. He defeated several princes subject to the emperor of China who opposed him, and penetrated to the borders of Shen-si, where the emperor kept his court. From thence he sent a haughty message, demanding that the princess might be immediately delivered to him, with a certain quantity of gold, silver, and fine rich silks, by way of portion. The emperor, offended at such an insolent demand, amused the messenger with hopes, till his troops were assembled on the frontiers, and then dismissed him disgracefully, without returning an answer to his master's letter. At the same time the Chinese army attacked that of Si-fan, and routed it; however, as the loss was not very considerable, Long-tsung rallied his troops, and being in a condition to give the emperor much uneasiness, the princess, by the advice of her father's council, was sent to the king of Si-fan, who, after the marriage ceremonies were over, led home his army, and afterwards became very serviceable to China on many occasions.

During many years after this memorable transaction, the kings of Si-fan, or Tu-fan, continued to live on good terms with the Chinese, and often assisted them with forces when domestic rebellions broke out, or when they were invaded by a foreign enemy. One of these kings of Tu-fan, whose name was Itay, was remarkable for making many excellent laws for the good government of his subjects; and he sent for learned men from China, in order to improve the minds and polish the manners of his subjects. He reigned many years beloved by his subjects, esteemed by his neighbours, and feared by his enemies; but dying without issue, was succeeded by his kinsman Yu-ma, a professed libertine, who gave himself wholly up to his pleasures, without minding the affairs of government. For some time he lived in peace with his neighbours; but oppressed his subjects with so much cruelty, that they left their native country in great numbers. In a word, his conduct was the first cause of the kingdom's falling to decay; and although he did not live long, yet misery increased with his death. As he left no issue, nor had nominated any person to succeed him, his queen, by the intrigues of her counsellors, had the address to get the son of her favourite, a boy of three years old, declared king.

On the first report of this election, Rye-tuna, first minister of state, hastened to the palace, and opposed it in behalf of the royal family; but his zeal cost him his life, for he was murdered as he was returning home. The conduct of the court lost them the affections of all the people; and La-kong-je, who then commanded the army, refused to obey the governors, and even formed the design of making himself king. He was a man of boundless ambition, proud, full of self-conceit, extremely passionate,

and often cruel. But on the other hand, he was brave, skilful, and capable of the greatest undertakings. He first caused a report to be spread, that he was preparing to extirpate the usurpers of the crown; and then marched directly against the army of the new king, which he defeated; and afterwards plundered the town of Wey-Chew. By this time his army, by the accession of malcontents, was above a hundred thousand strong; but his chief design was, to bring the governors of the provinces into his measures.

The chief of these governors was Shang-pi-pi, a man of great experience in military affairs, who had trained up his soldiers in the most exact manner. To him Lu-king-je wrote a very flattering letter; but Shang-pi-pi saw through the deceit, and sent him an answer which flattered his hopes. At the same time he marched forward with his whole army, and came upon the rebels so unexpectedly, that he soon routed them, and put them to flight. Lu-king-je was so much afraid of losing the remains of his army, that he marched towards the borders of China, where he was joined by vast swarms of Tartars; and in order to make them subservient to his purpose, he gave them leave to plunder several of the Chinese provinces. At first he had some success, but the Chinese coming upon him in great numbers, drove him out of the empire, and took several of the frontier towns of Tu-fan.

The rebel, who considered these losses as no more than trifling, and such as might be easily retrieved if once he could make himself master of the kingdom, augmented his army with a vast number of Tartars, whom he allured with the hopes of plunder; and bent all his thoughts on reducing Shang-pi-pi. With this resolution he began his march, and arriving near Chen-Chew, forced Shang-pi-pi to abandon his camp, which he had fortified on the first news of his approach. Hereupon that officer crossed the river, broke down the bridges, and did every thing he could to impede the march of the rebel general, who sought to bring him to an engagement, but could not.

The rebels committed great ravages all over the country, as far as they went; but the violent overbearing temper of their general increased so fast, in proportion to the success he had obtained over his enemy, that many of his forces forsook him, and joined themselves to Shang-pi-pi; and the Tartars, who had been disappointed in their hopes of plunder, retired home to their own country, laying every thing waste before them.

Lu-king-je hereupon, despairing of compassing his design, submitted to the Chinese emperor upon certain conditions, and repaired to Ko-Chew, a city of China; where he lived in ease the remainder of his life.

This happened about the middle of the ninth century; and the kingdom of Tu-fan being torn in pieces by contending parties, each of the princes of the blood, as well as the chiefs in the army, set up for sovereigns themselves over the different provinces; so that for many years the whole country was deluged with blood.

In the midst of these confusions, and when the people were weary of destroying each other, Pan-co-chi, prince of Lü-kû, and of the blood royal, stood up in their defence, and took them under his protection. As soon as they beheld a chief of the blood royal of their antient kings, they quickly formed an army, and attacked the king of Kya, who had treated them most ungratefully for the services they had done him. Pan-co-chi offered to join himself to the Chinese army, upon condition the emperor would honour him with a title that might give him more authority among those of his own nation. The proposal being liked, the emperor sent him patents, by which he was constituted commander in chief, and captain general of the kingdom of Tu-fan. The king of Kya, who knew nothing of these private transactions, after making some ravages in the adjacent country, besieged the city of Si-lyang; and having taken it, put the governor to death. He thought to have pushed his conquests further, believing that Pan-co-chi was coming

to join him with his troops; but that prince arriving at the head of sixty thousand men, attacked him with so much fury, that he totally defeated his whole army: This victory might have been attended with very beneficial consequences to the kingdom of Tu-fan; but the brave Pan-co-chi received a mortal wound, of which he died within a few days afterwards.

So-tfo-lo bent his whole thoughts towards recovering the dominions of his ancestors; and for that purpose formed a small court, and began to raise an army; with these forces he invaded China several different times, but was always beaten; and at last obliged, for his own safety, to conclude a peace on the best terms he could obtain. Indeed, there were such numbers of contending parties in his army, that he could not put the least confidence in any of them; so that this was perhaps the best measure he could take.

As the growing power of the king of Kya continued daily to increase, and as he had assumed the title of emperor of all the Tartars, So-tfo-lo considered himself in extreme danger; so that he was obliged to seek the assistance of the Chinese emperor. That monarch, to keep him firm to his interest, made him governor-general of all the province of Paw-shun; which was the more convenient for him, as it lay near to his own dominions. But soon after this generous donation made him by the emperor of China, So-tfo-lo died, and his kingdom being divided among his children, hastened the ruin of Tu-fan. That prince had, by his first wife, two children; the one named Hya-Chew, the other Mo-Chew-tfu. He had afterwards by a second wife, the prince Tou-Sheu. The mother of this prince prevailed upon her husband to imprison the rest of his children by his first wife; but they soon found means to escape, and having made known their rank to the people, vast numbers flocked after them, as the heirs of their late sovereign, who had always treated his subjects in the most tender, fatherly, and compassionate manner.

After many years spent in bloody and cruel wars, all these provinces put themselves under the protection of the Chinese emperors; and to them they have paid a small tribute ever since. But, as father Du-halde observes, the Chinese are obliged to consider them rather as allies, than subjects or vassals; and the tribute they demand from them, is rather a matter of form to keep up the alliance, than any thing that denotes either sovereignty or subjection.

The next place visited by the jesuits was KARAZM, of which they have given us the following account. "When we visited it, we found the people had never before conversed with any of the Europeans; nor do they know who inhabited our part of the world, only that they had heard there were some persons in China who came from Europe; and that they were priests of their religion. We explained those matters to them, for their language was in most respects the same with that used in the northern parts of China; and they treated us with every mark of respect, affability, and tenderness, according to the manner of their country.

This kingdom is bordered, so far as we could make any discoveries, on the north, by the country of Zükertan, and the dominions of the Great Khan of Tartary; on the east, by Bukharia; and on the south, by some of the provinces of Persia; having some parts of the Caspian sea to the west. It is about four hundred miles in length, and three hundred in breadth; and in many parts of it are vast sandy deserts, which are in a manner unpassable to any but those who travel in caravans, and who carry their provisions along with them. But in many of the provinces there is some land, which would at any time afford a sufficient subsistence for the people; but they are so much addicted to roving and wandering abroad, that they neglect agriculture, choosing rather to live by plunder. They have vast numbers of grapes, of which they make excellent wines; and they have true water melons, of a deeper colour than any we have in Europe. Some of their melons are perfectly white; but they are not so much esteemed as the others. The seed is black, shaped

shaped like that of the pompion, but more round and transparent, and has an exceeding fine taste. These melons are very cooling; and the largest quantity of them may be eaten without danger. They will keep so long, that the Tartars often carry them as far as Astracan, where they exchange them for such things as they want. In travelling over this country, we found that it owed most of its fertility to three rivers, and a large extended lake.

These rivers have their source near the bottoms of high mountains, by which this kingdom is separated from the dominions of the Great Mogul. The first of these is the Oxus of the antients, but is now called by the natives Amú. It crosses the southern part of Great Bukharia, from east to west; then winding north-east along the borders of that country, enters Karazm; and crossing it obliquely, forty leagues from its mouth, it divides into two branches; that on the left, turning westward, falls into the Caspian Sea towards the province of Astarabád; but the right-hand branch, which passed heretofore by the city of Urjenz, and met the sea twelve leagues to the north of the former, about one hundred years ago quitted its antient channel, six leagues from the place where it separated from the other arm; and changing its course more to the north, threw itself into the river Khesel, on the other side of the little town of Túk; so that its antient channel before the city of Urjenz, is at present quite dry, which has greatly injured that place. This river abounds with all sorts of the most excellent fish; and on its banks grow those melons which are so much esteemed all over the Indies, Persia, and Russia.

The next river is the Khesel, or Resil, as it is called by the inhabitants. It rises in the mountains to the northward of the province of Sogd, or Samarkant, and running north-west between the Amú and the Sir, falls into the lake of Aral, about sixty miles after it has been joined by one of the branches of the Amú. The ground near both sides of this river is extremely fertile, and produces excellent grain, whenever it is cultivated; but the inhabitants do not love agriculture, most of their time being spent in plundering those who live in the next provinces adjoining to them. Here, however, they find excellent pasture for their horses; for almost all the men in this country are habituated to riding from their most early youth.

Here are no towns of any note near the banks of this river; and as for the villages, they are in a manner deserted great part of the year.

The waters of this river are extremely increased by the junction of the Amú before mentioned, but of late years the Tartars of Karazm have also turned the course of the Khesel from the Caspian Sea, into the lake Aral, on the following occasion.

Peter the Great, emperor of Russia, being informed that there was much gold on the coast of the Caspian Sea, at the mouth of the river Sir, and judging that a trade might be carried on between Astracan and the southern parts of Asia, ordered certain persons, skilled in maritime affairs, to accompany the Cossacks of Jaik, in several of their expeditions along the coast of that sea, in order to find out the mouth of the Daria, the same which the Tartars call the Sir. Those people finding that no considerable river discharged itself into the Caspian Sea between the Yem, or Yemba, and the Amú, except the Khesel, concluded this must be the river they looked for; especially as the Cossacks assured them it was called Daria, not knowing that Daria is only an appellative, signifying any river in general among the people who inhabit near the banks of the Caspian Sea, and who are generally known in Russia by the name of Uzbek Tartars.

However, having founded the entrance of the Khesel, and observed several marks whereby to know it again, they returned, and made their report to the emperor. Peter was so well pleased with what he had heard, that in 1719 he sent one Brigadier Beckwitz, by the way of Astracan, with two thousand five hun-

dred men, to take possession of the mouth of this river. He pitched upon this officer, because he was a Circassian, and understood the Tartarian language, which is but little known to many of the Russians. The Tartars growing jealous to see him come several times that way, turned the stream of the channel by three different ways; the grounds being low, and the earth easy to be cut. These branches were conducted northward into the lake Aral, and then they stopped the entrance of the river; so that when Beckwitz arrived with his vessels, he found the mouth of the river quite dry.

However, in obedience to his instructions, he landed his men, and began to build forts, as well as the ground, which he found exceeding dry, would permit. But before he was well able to make any resistance, the Uzbek Tartars raised a great army, and came upon him while he had no thoughts of meeting with them.

Beckwitz defended himself with so much bravery, that the khan, who commanded the Tartars in person, despairing to conquer him by force, got one of his officers to inform him that he was secretly in his heart a real well-wisher to the Russians, and that he desired nothing more than to see them settled in the neighbourhood; but that he was obliged to oppose them to please the princes his neighbours and relations; that it was determined to renew the engagement the next day, and in case they had no better success than before, he would endeavour to bring about an accommodation.

Beckwitz gave the easier credit to the khan, because he had sent an envoy to the court of Russia, with a protestation of his sincerity. In the meantime the Tartars prepared for renewing the engagement, and when the morning came, many of them, contrary to their usual custom, jumped off from their horses, but were again repulsed with loss. Upon this, the khan sent two of his officers, demanding to know what business the Russians had to land men in his territories, and what it was that they wanted? Beckwitz returned for answer, that the sluices made in the river should be stopped up, and the mouth of it opened again, that the current might resume its former course. The Tartars remonstrating that it was not in their power to dam up the channels, because the water ran into them with such rapidity, Beckwitz proposed that they should deliver up to him a certain number of hostages, and he would go and do it with his own troops. As that was just what the Tartars wanted, they readily agreed to his demands; and the Russian commander having left some men to guard the forts, set forward with the rest: but the hostages, who served him for guides, led him into deserts, where there were only some holes of standing water, not sufficient for his troops; so that after five days march, they found themselves in danger of perishing. In this distress their guides proposed to divide them into several small parties, and lead them by different ways; and Beckwitz was obliged to comply, although he saw the danger that would attend such a measure. In short, the Russians having thus imprudently separated themselves into parties, the Tartars surrounded them one after another, and having killed their leader, with the greatest part of their men, led the rest away into slavery. Those who had been left to take care of the forts, embarked on board their vessels, and, as good fortune would have it, got safe to Astracan.

The Lake of Aral, that is, the Lake of Eagles, separates the province of Aral, to which it gives name, from the eastern provinces of Karazm. It is one of the most extensive lakes in the northern parts of Asia, being in compass above eight hundred miles. Its waters are exceeding salt, but contain great quantities of the same sorts of fish that are found in the Caspian sea, with which it does not seem to have any connexion or communication; nor does it overflow its banks, although it receives the waters of several rivers into it. The Tartars, who inhabit the northern

banks of this lake, take great quantities of the water, which they lay on the sands to dry, and the sun turns it into a fine chrystalline salt, which they sell to the people of the neighbouring provinces.

We had several guides to conduct us to Urjenz, the capital of the kingdom, situated in a great plain to the north of the River Amú. It was formerly a place of considerable strength, but since the Tartars became possessed of it, and the northern branch of the Amú, which ran by it, has taken another course, it has fallen into decay; so that at present it is a poor contemptible place, with mean houses, and about three miles in circumference. Its walls are of burnt bricks, very narrow, and the ditch around it is nearly filled up. The country round this city is fertile, but the want of cultivation gives it the appearance of a desert. We conversed with some of the people, but found them extremely ignorant, having no notion of any thing that bears the name of religion, unless it be the worshipping of idols they call So. It is true, they have their temples, which are little better than miserable huts; and their idols are so numerous, that there is hardly any such thing as giving an account of them. Every family has its god, but they have so little regard for them, and such unworthy notions of all that belongs to the supreme being, that we often wondered how human nature could be ever sunk so low. Whenever they imagine that their gods refuse to hear their prayers; or, in other words, when they do not obtain what they solicit for, then the image is dragged into the streets, and broken into a thousand pieces. Nothing is more common among them, than to hear them disputing concerning the power of their different gods; just in the same manner as we frequently dispute concerning religious points in divinity; and as we frequently make converts to the Catholic faith, so these Pagans prevail upon their neighbours to change their gods.

When they are seized with any sort of sickness, even with the most violent fevers, they use but one remedy, and that is, horses blood mixed with milk, which the patient drinks. If he refuses to drink it, he is considered as past recovery; but if he drinks it off, then he is supposed to be in a state of recovery; which, according to their notions, frequently happens.

The care of the sick is for the most part left to the women, who reside at home; for when the men are roving abroad in search of plunder, and any of them is at that time taken sick, it frequently happens that they are left to perish. Their military officers exercise an unlimited authority over the soldiers, or rather over the men, for all those who are able to manage a horse are considered as soldiers. They make little account of losing two or three hundred men on an expedition; and when they return home, the relations, who are so accustomed to these things, seldom make enquiry concerning them. This may serve to shew that there is a great difference between the manners and customs of those who live in a state of nature, and such as are governed by the rules of human society." So far the learned jesuits, with respect to the manners and customs of these people; we shall now go on with some farther extracts from their writings.

The jesuits have not been so accurate as could have been wished in their account of the antiquities of this country; which is the more to be wondered at, because they were men acquainted with all sorts of learning. We shall therefore endeavour to make up that difference, by pointing out what this country was in antient times, and how it became reduced to its present state. This will appear the more necessary when we consider, that there is no forming any notions of them without being well acquainted with what they were originally.

Herodotus, who lived long before the most flourishing period of the Roman empire, says, That in his time it was subject to Persia; which is not at all to be wondered at, because Persia was then in such a state of gran-

deur, that she was considered as the mistress of the eastern world. This was long after the death of Cyrus; and Darius placed a governor in it, who acted as a lieutenant or deputy under himself. Probably, when Alexander the Great subdued the Persian empire, this province, among the rest, submitted to the conqueror; but the confusion that took place afterwards, has left us intirely in the dark. Indeed we meet with no farther notice of it, till the Arabs took possession of it towards the latter end of the seventh century, and placed a governor in it, as they did in all the neighbouring provinces. The Arabian caliphs kept possession of it upwards of two hundred years; but their power falling to decay, the inhabitants of Karazm were the first who stood up in defence of their antient rights and privileges. But still there were not many kings in this country for several years after; for every pretender having set up for himself, the state was involved in civil broils and dissensions, nor did any of the inhabitants know who was the rightful sovereign. At length it fell under the dominion of Sultan Mahomed Gazni, King of Khorasan, who took possession of it in the year 1016, and made it a province of his empire. In this manner the kingdom of Karazm continued till the year 1092, when the governor Kothb-addin, taking advantage of the broils that ensued, in consequence of the death of Mahomed Gazni, assumed the power of sovereignty, and got himself declared king, contrary to the opinion or consent of the antient nobility. But that title was better established by his son and successor, Mahomed furnamed Atfiz, though not without great opposition from Sultan Sanyur, a neighbouring prince, who often reduced him to a state of dependency. But Takash, the Emperor of China, having espoused the cause of the King of Karazm, his sovereignty was firmly established by the fall of that of the Turks, whose power he put an end to in Persia, in the year 1196, and added their dominions to his own. His son Kothb-addin Mahomed extended the empire yet farther, by the empire of all Persia, and was the greatest prince in Asia, at the time when Jenghiz-khan invaded and took possession of his dominions, in 1218. In the mean time Karazm continued to be governed by its own princes for many years afterwards, but was in some measure subject to the Chinese at one time, and to the Persians at other times, till 1510, when the Persians again subdued it, and placed a governor in it. In that condition, however, it did not remain long; for within two years afterwards, the inhabitants, being tired of slavery, revolted against the governor, and having sent for Ibars Sultan, they proclaimed him king of the country, 1512; and his successors are in possession of it to this day. At present, nor for some years back, have we learned much concerning the internal state of this country; only that about the year 1720 there was a rebellion here, which terminated in the defeat of the rebels, and all the ringleaders were put to death. Three years afterwards, as appears from the testimony of Nacchi the jesuit, the prince of the country appointed a Mahometan governor; for that jesuit saw this governor near Aleppo, in his journey to Mecca in Arabia, where Mahomet lies buried. It is probably owing to this circumstance, that, according to the best information we have been able to procure, there are now many Mahometans in the country. It appears farther, from the jesuit's conversation with the governor, that the prince of the country had rebelled against the king his father, and caused his eyes to be put out, that he might have no farther hopes of enjoying the royal dignity; we learn farther, that soon after that horrid act of barbarity, the son was murdered, as a just reward for his unnatural cruelty to his father.

Bukaria, Bukharia, or Bokaria, by all which names it has been known in different ages, contains that vast tract of ground which lies between Karazm and the great sandy desert bordering on China. Its name is derived from a word used by the Mongul

Mongul Tartars, which signifies a learned man; because in former times there were in this country several schools for the education of youth in the liberal arts and sciences. But whatever learning was cultivated in that place in former times, certain it is, there is but little to be found there at present. The reason is obvious; the present royal family of China, sprung originally from the Mongul Tartars, and probably the first emperors of that race, took all the learned men along with them to Peking. This is no more than what has been done in many different countries; for conquerors, who intend to reside in the places they have conquered, soon forget those of their nativity; and, in order to make themselves the more agreeable to their new subjects, they generally bring along with them every thing that is valuable; and what is more valuable towards promoting the interest of a state, than learned men?

Duhalde, and the other jesuits who visited this extensive country, have given us the following description of it. "It is bounded on the north by the river Sir, which separates it from the dominions of the Eluths; on the east, by the kingdoms of Kashgar; on the south, by the dominions of the Great Mogul; and on the west by the kingdom of Karazm. It is in length about seven hundred miles from east to west, and six hundred in breadth from south to north. Considering the situation of this country, lying far towards the north, no place can be more agreeable. The mountains abound with the richest mines; the valleys are of an astonishing fertility, in all sorts of fruits and herbs; the fields are covered with grass the height of a man; the rivers swarm with the most excellent fish; and wood, which is so scarce all over Great Tartary, is found here in great plenty in many different parts. In a word, it is the best cultivated country in all the northern parts of Asia; but all these blessings are of little service to the inhabitants, who are naturally so lazy, that they would rather steal, or rob, and kill their neighbours, than apply themselves to improve the benefits which nature so liberally affords them.

After a journey of three weeks (says Duhalde) we arrived at the capital city of this extensive kingdom, which is called Bokara; so that it either gives name to the place, or receives its name from it. It is situated in a most delightful plain, and surrounded by a wall made of earth. It is of great extent, and divided into three parts, of which the castle is one, where the Khan, or king of the country resides; for by the castle we mean all those necessary buildings adjoining to it, as well as the fort itself. The second division of the city is taken up with the apartments allotted for the military, from the commander in chief down to the common soldiers; for in this country all military men are alike honourable, though all are not equally rich. The third division, which is the largest, is possessed by the merchants and tradesmen, with all the common inhabitants in general. In this last division, every trade or profession has its particular quarter, and the houses for the most part are of earth; but the temples, and all the public structures, are of stone; sumptuously built, and curiously gilt, especially the baths, which are so skilfully contrived, that none like them are to be found in the world.

There is a most beautiful small river, which divides the city into two equal parts, but the water is of such a noxious quality, that the person who drinks of it, while he is in a sweat, is in danger of having worms bred in the fleshy parts of his legs, which frequently turn to a mortification. They have an art of extracting these worms, by pulling them out gently; but if they break in the operation, it generally proves fatal to the patient. The method prescribed when these worms make their appearance, is to give the patient water mixed with mare's milk; and those who neglect to do so, are whipped through the market place. There are officers appointed to search all houses for spirituous liquors; and in case they find any, to break the vessels. Nay, it frequently happens, that if a person in-

forms against another for drinking strong liquors, the person accused is tied to a post and whipped. The severity of this law is owing to an ancient order made by some of their priests in former ages, in order to prevent drunkenness; which cannot be of any great service, nor much regard be paid to it, for all those who live in cold countries will naturally wish for hot liquors.

The power of the king is much restricted; and his revenues are so small, that he is obliged to depend for a subsistence from the city. He takes the tenth part of the value of every thing sold, to the great injury of the people; and when he wants money to support his extravagancies, he sends his officers to seize the goods of the shop-keepers. Thus, though his power be small over such of his subjects as reside in the country parts, yet he exercises a tyrannical cruelty over those in his capital city. While we were here, the prince often sent for us, and asked us many questions concerning the laws, religion, and power of the European nations, and he listened to the account we gave him with great attention; and notwithstanding the despotism he exercised as already mentioned, yet we saw several instances of his justice to strangers. A caravan happening to come from Persia into his dominions, it was robbed, and some of the people murdered. Complaint being made to the king, he sent an hundred armed men in pursuit of the robbers, some of whom were taken and hanged, and the goods restored to the owners.

The country of Bukharia was formerly subject to the Persians, and the Persian language spoken there; but at present the Bukharians are continually at war with their neighbours on account of religion, though both are Mahometans. They quarrel with the Persians, because they will not cut off the hair from their upper lips, as they and all other Tartars do. To suffer the hair to grow on the upper lip is by them reckoned a great sin, and therefore they call the Persians, *Kafvs*, which signifies unbelievers; and this is the name they give to the Christians. Almost every year the king goes out to war; and it frequently happens that, in his absence, his dominions are invaded from another quarter than that to which he has marched.

They have no gold coin in this country, and but one piece of silver, about the value of an English shilling. Their copper money is in very small pieces, for one hundred and twenty goes to make up the silver one, which is not so commonly used in payment as the copper, the king often setting what price he pleases upon it.

The trade here was once very considerable, for caravans used to arrive once every year with goods from Russia, Persia, and India; but at present it is so fallen on account of the poverty of the people, that not above one caravan arrives in the space of three years. The chief articles sold by the inhabitants to these merchants are, raw silks, raw hides, slaves, horses, and such like; and in return, they take calico and unwrought silk. Formerly caravans came from China, which the Bukharians call *Kathay*, when the way was open. This journey took up nine months; and the merchants brought along with them musk, rhubarb, fatten, damask, and other goods; but that commerce has been destroyed in consequence of the bloody wars carried on by the Tartarian nations.

The city is conveniently situated for trade; and formerly the duties on goods did not exceed three per cent. but at present the merchants are so much oppressed, and so loaded with taxes, that few have any encouragement to visit that place; however, it is from hence that the dominions of the Great Mongul, and part of Persia, are supplied with dried fruits of all sorts, which have a most exquisite flavour.

Besides the capital city Bokhara, we visited several others; but in number of inhabitants, and extent of buildings, they are much inferior. *Kasmina*, one of these cities, is situated in the province of that name, towards the frontiers of Karazm; but although formerly

formerly a place of note; yet it is now a very inconsiderable town. About ten or twelve miles to the west of this, lies Wardenfi, situated near the extremity of Karazm, and is a pretty neat town, surrounded by pleasant fields and beautiful gardens. The inhabitants drive a considerable trade with the Persians, but not so extensive as it was formerly, on account of the long and bloody wars that have been carried on in that part of the world.

Karshi, another city in this kingdom, is situated on the north side of the river Amú, and is, next to the capital, the best city in the kingdom; being large, populous, and well built. The neighbouring lands are exceedingly fertile in all sorts of grain and fruits; and the inhabitants carry on a considerable trade to the northern parts of the Indies. It was in the beautiful plains adjoining to this city that the great Tamerlane often encamped his army, when he marched to and from the Indies. A little to the north of this city is a small zam; and the river Amú being fordable here, it is generally crowded with people, who pass through it in their way to Persia; but otherwise it hath nothing remarkable.

What we have just now extracted from the jesuits, relates chiefly to the ancient or Proper Bukharia, for there are many other provinces which they visited adjoining to it, that are often called by the same name. All these provinces were visited by the jesuits, as well as by several European merchants, who carried goods in caravans all the way across Asia; from Aleppo, into Tartary.

The first of these provinces we shall mention, is Samarkant, being about five hundred miles long, and the same number in breadth. It was formerly full of flourishing towns and cities, but most of them now are either totally ruined, or much decayed. "We entered it, (say the jesuits) from the east of Bukharia Proper, and travelled over a most delightful country about ten days, when we arrived at the city of Samarkant, which gives name to the province. It is situated in a valley, on the banks of a river called Sogd, and known to the ancients by the name of Sogdiana. It is a large, well-built, populous town, and fortified with strong bulwarks of earth. There being several quarries of free-stone near the city, some of the houses are built of stone, particularly the castle for the residence of the khan, which is the most spacious edifice in the province. But as this province has at present no particular khan, so the castle is much neglected; for when the khan of Great Bukharia comes to visit this place, he encamps on the meadows adjoining to the city.

But the most remarkable curiosity in this city is an academy, where all the several arts and sciences known in that part of the world are taught; and here are a great number of young men of the Mahometan religion, who visit this place from all the neighbouring countries to pursue their studies: They have apartments allotted them, and pleasant gardens to walk in; but they would not permit us to hear their exercises; so that all we could learn was, that they study some parts of astronomy, geography, history, and have moral lessons delivered them on select passages in the Alcoran.

Near the city runs a small river, which falls into the Amú, and might be of great utility to the place in opening a communication between the inhabitants and the neighbouring kingdoms, had the former but sufficient industry or knowledge to make it navigable; but that trade may flourish, there would require another sort of a master than a Mahometan Tartar. They make here the most beautiful silk paper that is to be found in all Asia, which occasions it to be held in such repute throughout the east, that they have a considerable demand for it.

The country produces apples, pears, raisins, and melons, of a most excellent taste, and in such plenty, that vast quantities of them are sent to Persia, and throughout several parts of the Mongul empire. The women have almost the same liberty as in Europe,

and some of them are far from being disagreeable, but they never converse with strangers.

Otrar, the next city of any note in this province, is situated near the northern extremity of the country, and is, like Samarkant, built in a delightful plain; having a small river running through it. The houses are low and meanly built; but there are a considerable number of inhabitants. It is secured by a strong earthen wall, but little care is taken of it, except when they are afraid of the approach of an enemy. It was here that the great Tamerlane died, in 1405, who was one of the most extraordinary persons we meet with in history. He was left an orphan in his infancy, and brought up among shepherds on the mountains; but being of an enterprising disposition, cool, sober, and artful; he resolved to improve those talents in restoring peace to his country, then torn by intestine divisions; and harrassed by foreign invasions. In this undertaking he was much encouraged in consequence of his having learnt, or at least made to believe, that he was of the blood royal of Tartary. Whatever truth might have been in that, cannot now be known; nor is it at all necessary; for whether or not he was descended of kings, this much is certain, that powerful emperors have descended from him.

Having collected together a band of shepherds, endured to hardships, he trained them up to the use of arms, and attacked a band of robbers who infested the province where he resided; and this gave so much satisfaction to the people, that many of them joined him; and in one year he was so successful; that peace was restored to the greatest part of Tartary. This gave Tamerlane an opportunity of acquiring a name; and the people, who were at that time under the government of several petty princes, made him judge in all their controversies: This was just what he wished for; because he knew that nothing tended so much towards establishing power as that of deciding in difficult cases, where the people cannot agree among themselves.

The Turkumans, since called Turks and Ottomans, in memory of Othman, one of their leaders, were at that time beginning to be extremely powerful; and intending to push their conquests into the south-west provinces of Asia, they found, that unless they could bring the Tartars to be some way or other dependent on them, it would be dangerous for them to leave their dominions exposed to the inroads of such inveterate merciless enemies. Accordingly they invaded Tartary; and as the inhabitants were too haughty to submit; they chose Tamerlane to be their commander in chief. From this time the admired talents of this heroic leader began to shine forth in all their meridian glory; and the greater the dangers he had to oppose, the less he seemed to be affected. He drove the Turks out of Tartary, and having pursued them into the most fertile provinces in Asia, took prisoner Bajazet their leader, confined him in an iron cage, and stood upon it when he mounted on horseback.

Having forced the Turks to sue for peace, he granted it to them, upon condition that they should not invade Tartary; and, at the same time, though he was a heathen himself, yet he obliged the Turks to promise, under the severest penalties, not to invade the territories of the Greek emperors. Having thus far humbled his enemies, and given peace to all those provinces in Tartary that acknowledged his sovereign authority, he obliged the more refractory to submit; and, having thus united them, he set himself about making useful laws for their better government, both in peace and in war. Instead of suffering them to rove abroad in small parties, he had them regularly trained up to military discipline; and incorporated into battalions and squadrons.

He was unanimously elected khan, or emperor of Tartary; and no sooner had he received that title; than he resolved to shew himself worthy of it. He raised an army of near a million of men, most of whom were horsemen; and marched into the Indies, where he subdued the inhabitants, and laid the founda-

tion of the Mogul empire, which is inherited by his descendants to this day. All his soldiers were loaded with spoils; but so strict was he in preserving good order, that without permission from him, not one dared to meddle with the most insignificant article. This severity of discipline has made some authors accuse him of cruelty; but it should be considered, that he had a barbarous people to govern; upon whom ordinary punishments would have had but little effect. One day a farmer complained to him, that one of his officers had robbed him of some fowls, and the delinquent being brought before him, he ordered him to be spitted, and roasted to death before a slow fire. This may appear shocking to us; but let us only consider what kind of subjects Tamerlane had to deal with, and what objects he had in view.

His subjects were barbarians, till, by the severity of military discipline, he brought them into a state of subjection, and made them fit to be members of society. This was partly what he had in view; but still he aspired to higher things. He had already established an empire in the Indies, driven the Turks within the bounds of their own provinces, and greatly civilized the manners of his own people. His next scheme was, to make the succession to the Mogul empire hereditary in his own family, and accordingly gave it to one of his sons: Tartary he gave to another, namely the eldest; and as many of his subjects had embraced the religion of Mahomet, he humoured them so far as to do the same. Judging his end approaching, he sent for his deputy governors of the provinces, and caused them to promise to do every thing in their power to support his family on the throne; and to engage them in this, he made their offices hereditary. Having thus disposed of every thing in a proper manner, he died at Otrar, in 1405, well advanced in years, beloved by his subjects, and feared by his enemies. There are at present three emperors in Asia descended from this illustrious hero; namely, the Khan of Great Tartary, the Great Mogul, and the Emperor of China.

We thought it the more necessary to take notice of Tamerlane in this short digression, because though we find him often mentioned, yet does it not appear that many persons are acquainted either with his country, the age in which he lived, or his real character.

“ Having seen every thing worthy of notice at this place, (says Duhalde) we entered the province of Balk, situated on the south of Samarkant, and is in length about three hundred and sixty miles, and in breadth two hundred and forty. It is one of the most fertile provinces in Bukharia, which is the general name of this part of Tartary. The prince, who is subject in some measure to the khan of Tartary, enjoys a considerable revenue; for there is much silk in his dominions, of which the people make the most beautiful patterns. They carry on an extensive trade with the Indians and Persians, which contributes much towards civilizing their manners; but in all other respects, they are like the rest of the Tartars.

The city of Balk, which gives name to the province, is situate about fifty miles from the borders of Persia, on the River Debask, which, about forty miles to the westward, falls into the River Amú. It is at present the most considerable town inhabited by the Mahometan Tartars, being large, fair, and well peopled. Most of the buildings are of stone or brick; and its fortifications consist of bulwarks of earth, fenced without by a strong wall, high enough to cover those employed in its defence.

The khan's castle is a great building, after the eastern fashion, being almost wholly of marble, dug out of the neighbouring mountains, where there are many fine quarries of it.

All foreigners having free liberty to trade in this city, it is now become a place of great merchandize, and like a middle stage between Bukharia and the Indies. The fine River Debask, already menti-

oned, contributes greatly towards promoting the trade of the place; and only two per cent. duty is paid on goods either exported or imported; but passengers pay nothing.

We travelled through several vallies at the foot of lofty mountains to the south of Balk, till we arrived at the town of Anderab; situated near where the Mogul empire is divided from Persia and Bukharia. This place we found crowded with travellers; for all the goods brought from Bukharia to be sent to the Indies, are carried through the road adjoining to Anderab, there being no possibility for beasts of burthen to travel across the mountains. The town is not well fortified; but to make up that deficiency, a strong guard of soldiers perform duty, to protect the merchants who travel to and from India. The neighbouring mountains afford very rich quarries of lapis lazuli, with which the inhabitants carry on a considerable trade to India and Persia. There are many inhabitants in this town, and they have a mosque, which is but an indifferent building. The duty on all goods brought through either to India or Persia, is four per cent. because there is a necessity of keeping a considerable number of soldiers to prevent thieves from taking the goods.

More to the eastward, and at the foot of one of these mountains, stands the city of Badagshan, and is the frontier garrison between Great Tartary and the Mogul Empire. It is a very antient city, and almost impregnable on account of the mountains in the neighbourhood. It is dependent on the khan of Proper Bukharia; and in it is a strong castle, in which state prisoners are confined. The city, though not large, is extremely populous; and the inhabitants are enriched by their mines of gold, silver, and rubies, of which there are many in the neighbourhood. Those who dwell near the foot of the mountains gather great quantities of gold and silver dust out of the channels which are formed by the torrents which run from the top, when the snow melts in the spring. The rest of the Tartars look upon these people with contempt, because they follow merchandise, instead of plundering their neighbours; for the rude Tartars think nothing in the world so honourable as roving from place to place in quest of booty.

The inhabitants of this part of the country, and throughout the greatest part of Bukharia, are, in their persons, of an ordinary size, but well made, and fair complexioned, considering the climate. They have for the most part large eyes, black and lively; are hawk-nosed; their faces well shaped; their hair black, and very fine, and their beards thick. In a word, they are very different from many of the Tartars who live more to the northward; being in all respects much more handsome in their shapes, and agreeable in their countenances. The women are large in their make, have good shapes, and many of them very beautiful features. Both men and women use calico shifts and drawers, but the men are distinguished by a vest, which they call a *kaftan*, and it reaches to the calf of the leg. On their heads they wear a round cloth bonnet, shaped much after the Polish fashion, having a large border of fur; but the gentry wear turbans, after the manner of the Turks. They tie their vests about the middle with a girdle of silk crape, which goes several times round the body; and when they go abroad, they throw over it a long cloth gown fringed with fur, and lined with the same in winter. Their boots are made like the Persian buskin, but not altogether so neat; and they have the art of preparing horses hides for the purpose, after a very singular manner.

The women wear long gowns of calico, or silk, which are pretty full, and hang loose about the body. Their slippers are shaped like those worn by the women in the Indies, and they cover their heads with a little flat coloured bonnet, letting their hair hang down the back in tresses, adorned with pearls and other jewels. They travel in large caravans to China and the Indies, where they dispose of their goods to a very great advantage.

vantage. They are so different from the northern Tartars, that they never engage in wars; but apply themselves to the arts of peace, in manufacturing their silks, and carrying on an extensive commerce; for which they are treated by their savage neighbours as a cowardly people; notwithstanding which, they give more proofs of their good sense, than is shewn by those who despise them.

These natives of Bukharia are utterly at a loss to discover from what body of people they are descended; nor can they give any account of the time when they first settled in this part of the Indies. All they could tell me was, that they came from some distant country, of which they can give no further account, but that it has been transmitted down to them by oral tradition. Several writers have imagined that they are the descendants of the ten tribes, who were carried into captivity by Salmanassar, king of Assyria; (II. Kings, ch. xviii.) and this they think the more probable, because Media, where these people were placed by the conqueror, was situate near the borders of Persia, and in part of the kingdom which is now called Bukharia. The conjecture is farther supported from the circumstance of the people having much of the appearance of Jews, and many customs like theirs; but similitudes of manners and customs are often fallacious, and no certain rule by which we can distinguish between truth and falsehood. It is not said whether those who belonged to the ten tribes returned from the captivity, but yet it is certain, that many of them did; for when our Saviour was on earth, we find those mentioned who belonged to other tribes; and the reason is obvious. Many of the Jews, who were carried into captivity by Nebuchadnezzar, were settled near the borders of Persia; and Cyrus the Great having united these provinces together, a communication was opened between the ten tribes and those of Judah and Benjamin; so that there can remain not the least doubt, but that many of the ten tribes joined their brethren, and returned to Jerusalem with Zerubabel. Nay, if we look into the book of Ezra and Nehemiah, we shall find that some of each tribe are mentioned; and probably it is owing to this that there is not at present any distinction between the tribes among the Jews. However, it is more than probable, that this place, called Bukharia, is no other than what the Jews tell us many of their countrymen reside in; but such a fable does not deserve credit; for no modern traveller gives any countenance to the opinion.

Leaving Great Bukharia, we travelled southward, through that vast tract of land called Little Bukharia; not that it is less in extent than the other, for it is larger; but it is called little, because it is neither so populous, nor has it so many fine cities. It is bordered on the north by Great Bukharia; on the west, by vast sandy deserts; on the east, by the country of the Calmuc Tartars, and the Monguls; and on the south, by Tibet, and the north-west end of China. It is in length, from east to west, about eight hundred and forty miles; and from north to south, five hundred and seventy. It has so many lofty mountains, that the air is colder in winter than is common in such a climate; but though it is not so well cultivated as the provinces in Great Bukharia, yet it produces the most excellent fruits and wines, with every thing necessary for the support of the people. It is very rich in mines of gold and silver; but the inhabitants are too lazy to work them.

Indeed, the only service the gold is of to them, serves rather to denote their indolence than their industry. They will not be at the trouble to work in the mines; but when the rain and melted snow washes the soil from the tops of the mountains, they stem the currents of the rivulets, and gather out the gold and silver dust, which they sell to the Indian merchants. There is much musk in this country, and all sorts of precious stones, and even diamonds; but as the inhabitants have not the art either to cut or polish them, so they are obliged to sell them rough to

the Indians and Chinese, who polish them, and dispose of them to the Europeans. The vallies at the foot of the mountains are not only fertile, but also delightful; and almost every one of them is watered with a stream of fresh water. The most disagreeable thing is, that when we went to the tops of the mountains, we naturally expected to have an extensive prospect before us; but we were deceived; because all we could see was the top of another mountain, or many other mountains, as high as that upon which we stood.

The country is divided into several provinces, all of which we visited, and shall here give as accurate an account of them as possible. The first of these is Kashgar; so called from its capital city, built near the banks of a small river, formed by streams issuing from the mountains. It was formerly a place of great strength, but having been often besieged and taken by some of the neighbouring princes, it is now fallen to decay. However, there is still a considerable trade carried on in it, though not equal to what there was formerly: Before the Turks settled in the southern provinces of Asia, this was their capital city, and some remains of their architecture are still to be seen in it. The inhabitants here treated us with great civility, and took any trifle we offered them in exchange for provisions. There are many small villages in this province, where the women are so far from being under any sort of restraint, that they actually cultivate the ground in the absence of their husbands. This is in a manner absolutely necessary, because the men are either employed in hunting, fishing, or merchandize.

Leaving Kashgar, we travelled eastward about ninety miles to Yarkian, situated on the banks of a river, which is formed by a collection of springs from the mountains, and running north about six hundred miles, after being joined by many other rivers, empties itself into a lake called Lop. The town is large and well built, most of the houses being of brick, but according to the eastern custom, they are only dried in the sun; so that the rain easily washes them away. All round the town, the ground is well cultivated, and produces all sorts of useful grain. There is a castle where a governor resides during two or three months in the summer, in order to collect the tribute for the khan. It is a place of great commerce; for the inhabitants trade not only with the subjects of the Great Mogul, but likewise with the Chinese, with the natives of Tibet, and even as far as Siberia.

Peter the Great intended to have settled a trade between his dominions and Yarkian, by means of the river Irtis, which would have proved very advantageous to his subjects, but he died before he had completed his design, and his successors have totally neglected it. A little more to the south lies the fine valley of Hotom, so called from a city of the same name. It was formerly a place of great importance, being extremely populous, and the inhabitants rich, by means of their trade. At present it is much decayed, but the trade is not ruined; for here is a continual resort of merchants from China, India, and Tibet. Although the inhabitants are for the most part Mahometans, yet there is a general toleration granted to all sorts of pagans, and that is the reason why we found several heathen temples in the town, and in the neighbourhood; but in their ceremonies they differed much from each other. Some of them sacrifice horses, and drink of their blood while it is warm; but such as are descended from the Chinese, make a continual rule to sacrifice hogs.

All the buildings here are in the eastern fashion, namely, of bricks dried in the sun; and the inhabitants pay a small tribute annually to the khan of Great Tartary, who keeps an army in pay to protect them. The best place we visited in this province was Akfu, which though not the capital, yet is the most flourishing town in the whole place. It is built on the north side of a small river, which falling from the mountains

mountains on the north, empties itself into a vast sandy desert on the south. There is a considerable trade carried on by the inhabitants; and here are manufactured some of the finest silks in the east. The town is surrounded by a stone wall, faced over with earth, and kept in good repair; having watch towers at equal distances, and fine walks for the inhabitants. The greatest part of the people are Mahometans, but there are also several pagans who have a temple, where they offer sacrifices of hogs to their idols, which serves to shew that they are descended from the Chinese.

Travelling more to the eastward, we arrived at Turfan, which gives name to a province. It is a city of considerable extent, surrounded by a brick wall, and extremely populous. The buildings are neat, being all of brick, and they have several mosques, the inhabitants being wholly Mahometans; for although they grant a general toleration, yet we could not find any heathens in the place, except such merchants as came from China and India. The country adjoining to the city affords all the necessaries of life; but there are few fruits besides melons. The melons however are of a large size, and fine flavour, so that they become a considerable article of commerce. They sell all these to the merchants who come from the Mongul empire, that sort of fruit being much valued there. Near the borders of this province, there is an extensive desert which reaches as far as the great wall of China; and in some parts of it, there are great numbers of tygers, and other wild beasts, so that there is no passing through it except in caravans, and every traveller must have arms to defend himself against these furious animals.

In the whole of this desert, there is neither grass nor water, so that those who neglect to take provisions for their horses along with them, are apt to lose them before they get at the end of their journey. The Tartars therefore use dromedaries, because little food serves them, and they can live without water five or six days.

With respect to the inhabitants of Little Bukharia in general, we found but little difference among them; for they are in general swarthy and black-haired, although some of them are fair. They treat strangers with great respect; but they are extremely covetous, which is the reason they carry on such an extensive trade with China, Persia, India and Russia. Those who deal with them, and are unacquainted with the arts they practice, are sure to be cheated or imposed on. In their habits, the men differ very little from the Tartars; for they wear a sort of frock of coarse cloth, that falls down to the calves of their legs, having sleeves very wide towards the shoulders, but narrow at the elbows. They wear girdles like the Poles, and these are generally of stripes made of scarlet-coloured silk. The habit of the women differs but little from that of the men. They wear loose robes of quilted cotton, with bobs in their ears, twelve inches long, falling often as low as their shoulders. They part and twist their hair in tresses, which they lengthen with black ribbands embroidered with gold or silver, and with great tassels of silk and silver, which hang down to their necks or their breasts; they wear tufts of silk, and their necks are adorned with strings of pearls, with several pieces of coin hanging from them, so that they make a glittering appearance, which serves to please the men, whose tastes are not very refined. Both sexes carry about with them little cotton bags, in which are several prayers written by their priests, and these they repeat as antidotes against any evil that may happen to them.

The young women, in order to make themselves appear more beautiful than those advanced in years, make use of vermilion with which they paint their nails; and this colour sinks so deep, that it will remain several years without being renewed. Both men and women wear close drawers, and boots made of Russia leather, very light, and much in the same shape as the slippers worn by the Turks. They also

wear the same sort of bonnets and covering for the head; except that the women have theirs adorned with pearls. That a married woman may be known from a virgin, the former are distinguished by a long piece of linnen, which they wear under their bonnet, and after folding it round the neck, they tie it in a knot behind; so that one end hangs down to the waist.

Some of their houses are of stone, but the greatest part of brick; and in their furniture they have nothing ornamental. They have neither chairs nor tables, nor is any thing to be seen in their chambers but some China trunks, upon which they spread carpets made of cotton, and of various colours. Their window curtains are also of cotton with flowers wrought in them; and their bedsteads are about half a yard high, and four yards in length; but in the day these are covered with carpets. They go to bed stark naked, but always dress in the morning when they get up, and sit cross-legged, in the same manner as the Turks.

They are very neat about their victuals, which the slaves dress in their masters' chambers; where, according to the number of persons in the family, there are several iron pots, set in a kind of range near the chimney, which serves to warm the house during winter. Some have little ovens made of bricks, and in these they frequently bake their victuals. Their kitchen utensils are for the most part of copper vessels, in which they boil their tea, and warm water when they want to wash themselves. A piece of calico serves them instead of a table cloth, and they use neither knives nor forks, but pull the meat to pieces with their fingers. They are extremely fond of soups; and in eating them they use large wooden spoons, much in the same form as the ladles we have in Europe, with which we skim our pots. Their usual food consists of minced meats, of which they often make a sort of pies of a semicircular form, and these serve as provisions when they go on a long journey, particularly in winter.

They carry this food in bags; and when they have occasion to use it, they put it into boiling water, so that its taste very much resembles the minced veal of the English. Their usual drink is tea, and they have a black sort which they prepare with milk, salt, and butter, and they eat bread along with it. This, however, is not, properly speaking, tea, for it is made of black beans, a grain used by the Tartars in general, of which they make their bread. It is extremely wholesome; and we found but little difference between it and the Turkish coffee.

The people however are too much addicted to the use of it, which conduces greatly to depress their spirits, and reduce them to a state of the most abject indolence. Probably it is owing to this that their minds are in a manner strangers to ambition; for there is a possibility of human nature sinking so low, that even art becomes necessary in order to raise it up to its original state of grandeur. These people are, like many others in northern nations, much addicted to drinking spirituous liquors, which generally produces quarrels, and frequently ends in riot, debauchery, or perhaps murder.

In the article of marriage, they buy their wives, and pay for them according to the share of beauty they possess; and as the parents receive the purchase-money; so the best estate a man can have in this country is at least half a dozen handsome daughters. The persons to be married are forbid to speak to each other from the time the contract is signed, till the day of espousal, when they spend three days in all manner of banqueting and feasting. The evening before the wedding, a company of young girls meet at the bride's house, and divert themselves till midnight, in playing, dancing, and singing. Next morning the guests meet at the bride's house, in order to prepare her for the ceremony. This being done, they give notice to the bridegroom, who arrives soon afterwards, accompanied by several of his friends and relations, and followed by several persons, playing

playing on flutes, and such other instruments of music as are used in the country.

When the bridegroom arrives, he entertains the company with a horse-race, and distributes prizes according to the merits of the riders, of which he himself is the sole judge. These prizes consist chiefly of skins of black foxes, or pieces of fine silk, and they are held in much esteem by those who receive them.

The young couple do not see each other while the ceremony is performing, but answer at a distance to the questions proposed by the priest. When the ceremony is over, the bridegroom returns home, and entertains the company according to the nature of his circumstances. After dinner, he goes to the bride's house, accompanied by his relations and friends, and desires to be admitted to speak with her. This favour however is not granted him; so that he is obliged to withdraw; but he returns again the same evening; when he finds the bride in bed, surrounded by her women, and he is permitted to lay himself down in his cloaths beside her, but that is in presence of the women; so that in a few minutes he is obliged to withdraw.

The same farce is repeated three days successively, nor do the new-married couple go to bed till the fourth night; and on the fifth day the husband carries his wife home in triumph. If the parties are young when the marriage is concluded, it frequently happens that they do not converse together, nor consummate the marriage, in less than two or three years after the ceremony. In such cases the money given for the wife becomes the property of her parents, if she dies; but as a principle of generosity takes place more or less in all countries, so nothing is more common than for the bride's parents to return part of the money to the husband.

All the women in this country are considered as impure for forty days after their delivery, and dare not so much as say their prayers during the whole of that time. The child is named the third day after its birth, by the father, or some one of the nearest relations; who, at the same time, presents the infant with a bonnet, or a piece of silk, which he is to keep so long as he lives.

At seven years of age they are circumcised, on which occasion the father makes a feast, to which he invites most of his friends. From this circumstance we may learn, that circumcision is a very antient custom in the eastern nations; but that is not sufficient to prove that the people in those countries learnt it from the Jews.

By the common law of this country, polygamy is forbidden; and yet it frequently happens, that a man has ten or twelve wives. Divorces are frequent among them; and when a man sends his wife home to her relations, it is customary to return all those things which she considered as her property while she lived with him. This, however, is a matter of favour, for she has no right to demand them; but in order to preserve the peace of families, the husband generally complies; and these separations are so little regarded, that scarce any notice is taken of them; and the woman who is divorced from one husband, can soon be married to another of equal rank.

When one of the natives falls sick, he sends for a priest, whom they call a Mullach, and he reads to him several prayers, after which he breathes upon him, and with a knife makes several flourishes round the patient's face, as if he intended to cut him. By this operation they imagine they cut out the root of the disease, which they suppose to be caused by the agency of the devil. But when the patient dies, the priest lays the Alcoran upon his breast, and recites several prayers. After this, the corpse is carried to the grave, which is generally in some solitary grove in a wood, and they inclose it with wooden palisades.

They have no money coined, but they take it by weight, which was the custom in all antient nations;

for we read, that when Abraham bought the cave of Machpelah, he paid for it a certain sum according to the current price given by merchants; which must mean, that he gave a certain sum of gold or silver, not as coined, but by weight.

Mahometanism is the established religion; but they grant a toleration to pagans, and indeed to all those of what denomination soever they may happen to be. But whether the ancestors of these people ever learned any thing concerning Jesus Christ, this is certain, that they have heard of him, though in a very confused manner; as will appear from the following tradition; which they look upon as sacred.

They say, That the Virgin Mary being a poor orphan, and her relations having some disputes concerning her education, resolved to decide them by lot. Accordingly they threw a feather into a vessel full of water, and he to whose finger it stuck was to bring up the child. It fell to the lot of Zacharias, for no sooner had he put his finger into the water, than the feather came from the bottom, and fixed upon it. This miracle induced him to carry her home to his house, where he brought her up in the most tender manner, as practised by the Jews after their return from their captivity.

It happened one time, that the business of the temple kept him three days from home, and during that time he recollected that he had locked the young girl up, so that no person could come near her. Upon this he ran home as fast as he could, but instead of finding her dead as he feared, she was surrounded with all sorts of eatables, which she said God had sent her from heaven. When she was about fourteen years of age, she went to bathe in a fountain, according to the custom of the country; but while she continued there, she heard a voice which exceedingly struck her with fear, so that she hastened to put on her cloaths, in order to return. But presently an angel appeared, and told her, that she should conceive and have a son, whom they were to call Isay, which is the same we call Jesus, and answers in all respects to the Hebrew word Joel.

Mary replied, that she was afraid of the pains of child-bearing; but the angel breathed on her breast, and bade her fear nothing, as the divine power would support her. In short, she conceived from that moment; and the time of her delivery approaching, she went and hid herself in the desert. There falling in labour, she supported herself against the trunk of a decayed tree, and in that condition was delivered. At that instant the rotten trunk of the tree began to spread forth leaves, and the country all around breathed the sweetness of spring. The angels came to comfort the virgin; and she being perfectly recovered, returned home to her relations, who refused to receive her. All this indignity she bore with patience, and finding she had no reason nor any hope to expect favour from her relations, she returned home, and spent her time in bringing up her son, according to the rites of the Jewish religion; for she knew of no other.

Young Isay in time became a great prophet, and a doctor of high authority, but was generally hated and persecuted by every one, especially by the great men of his time. They often laid in wait to murder him, though without success; for God took him in an instant up to heaven. As two assassins had been employed to murder Isay, so God, to punish them, transformed them into the shape of their celebrated prophet; and they having deceived the people by telling them many falsehoods, they rose, and stoned them to death.

Dark and confused as this traditional story may appear, yet we cannot imagine that it was invented by these people, but rather that there might have been a traditional account of Christ handed down among them, from the age of the apostles. This will appear the more evident, when we consider that these people, while they deny that Christ, whom they call

May, suffered death; yet they believe in a resurrection, and a future state of rewards and punishments.

But with respect to punishments in another life, they do not believe them to be eternal, but only for a certain time; affirming, that as devils first led man into sin, so the weight of the punishment will fall upon them. They have likewise another notion, which seems to be peculiar to themselves, namely, that at the general resurrection many creatures, both angels and men, will be annihilated; but the latter will be purified, and taken up into the heavenly mansions.

They believe that there are eight paradises for the elect; and seven hells for the wicked, where sinners are to be punished by fire; and that the sinners who will suffer the severest punishment, are liars, cheats, and back-biters. That one out of an hundred will be chosen from among the wicked, on whom the fire will have no power, and this small company will be taken into a particular paradise, where they will enjoy all sorts of felicities, till God creates for them a new world, instead of the present which we now inhabit. According to them, it is a sin to say, God is in heaven; for they are taught to believe, that he is every-where present, not being confined to any place whatever.

The government of this country has never been properly regulated; nor can we find that they ever had a constant succession of princes. At present their government forms something resembling what we call an aristocracy, by which is meant that the power is lodged in the hands of individuals. They have a vast number of magistrates from the highest degree to the lowest, and they all compose as it were links of the same chain. The lower order of the magistrates decide in all matters of controversy between the people in the first instance; but from their judgments appeals lie to the higher tribunals. This preserves a sort of harmony among them; for when people, let them be ever so rude, are accustomed to an uniform system of laws, they look upon them as containing something of a sacred nature, and submit to them without reluctance. But yet this form of government does not answer all the ends necessary to be attended to in conducting the affairs of civil society.

The whole body of the people may be said to consist of two classes, namely, merchants and robbers. The merchants are regulated by their own customs; and, as for the robbers, they are under no other form of government, except the orders of their chiefs. The former trade with the Indians, Chinese, and Persians, and live in a very peaceable manner; but the latter run all hazards to live by plunder, while at the same time they might be more happy, were they to remain at home and cultivate their lands. By this they would enjoy the contents of peace, and live in comfort with their families; but their roving dispositions are such, that nothing can bring them to a sense of honour, honesty, or duty; for, like wild beasts of prey, they think it no crime to rob and plunder their neighbours.

Near adjoining to Little Bukharia, is the country called Turkestan, or Country of the Turks, which is at present inhabited by Tartars, who are of the Mahometan religion. They are sometimes called Uzbecks, but their antient name was Turkumans; so called, according to their traditions, from Turk, whom they make to be the eldest son of Japhet. All those people now called Turks, are descended from them; but at present they have no connection with each other.

In the History of the Decline of the Roman Empire, we read, that about the middle of the sixth century they were a very inconsiderable body of people, who dwelt on the north-west of Bukharia; and their chief employment was working in iron mines, with which they carried on a considerable trade, and made all sorts of warlike instruments. We are told further, that before the end of the sixth century these people became so powerful, that they sent ambassadors to the Emperor Justin, at Constantinople, desiring to enter into a treaty with him; and they

brought along with them large quantities, which they sold to considerable advantage. At that time they had a chief, whom they called their kagan, or khan, and his name was Difabules. This prince, finding his country too narrow to contain the number of inhabitants, led out a great army, and encamped them near Ek-tak, or the Golden Mountain. It stood on the most eastern part of his dominions, and had its name from the abundance of fruits and cattle that were there; and not from gold mines, as some have thought. Difabules dying in 580, was succeeded by his son Toxander, who marched an army against a fierce people, called the Orgorites, whom he subdued; and in 600, having added their dominions to his own, he sent an ambassador to the Emperor Mauritius at Constantinople. And probably it was during these embassies, that the inhabitants of Turkestan first formed the design of extending their conquests to the south.

As these Turkumans had almost continual wars among themselves, as well as with the Chinese and nations of Great Tartary; so it is natural to suppose, that in time their territories, though enlarged, were divided among many khans or chiefs; and many of the nations subdued by them threw off the yoke at the beginning of the tenth century. In the year 1216, Zenghiz-khan seized on the greatest part of the country; and thus an end was put to their government in that part of the world, except that it retains the name of Turkestan, and is the country we are now treating of.

There are several fine rivers in this country, particularly the Doria, famous for its gold sand. Peter the Great procured some of that sand, and employed artists to try it, and found it exceeding good. The inhabitants carry it to Astracan, where they exchange it for furs, and these they either wear themselves, or sell them to the inhabitants of the Mogul Empire.

They have another river, called the Yem or Yemin, which rises in the great mountains of Tartary, and running about three hundred miles along the borders of Russia, falls into the north east corner of the Caspian sea. This river, which abounds with most excellent fish, is excessively rapid, but shallow. The waters of it are delightful, and its banks as fertile as can be imagined; but the inhabitants pay so little regard to the cultivation of the earth, that these beautiful spots of ground are in a manner totally neglected. There is neither town nor village on the banks of this river; for the water is so shallow, that the Russians cannot sail up it; and as for the Tartars, they live mostly in huts.

Turkestan is divided into two provinces, namely, the western, and eastern. The first, possessed by the Mankats, extends from the town of Turkestan to the Caspian sea; and the second, in the hands of Kafatchia-orda, reaches from the same town to the mountains east of Andugan; but all the towns in both parts are built upon the River Sir, or the rivers that fall into it.

The western part has for its capital Turkestan, which seems to give name to the whole. It is situated on the banks of a small river, that falls into the Sir, a little below the town; and though the houses are built of brick, yet it is but a very indifferent place, having nothing to recommend it besides its agreeable situation. The inhabitants call themselves Mankats, but the Russians call them Kara-kalpaks, from their wearing a cap or bonnet open before and behind, with broad brims on each side. They are professed robbers, having nothing to live on but what they steal from the Russians, and other people around them. They often pass the mountains in numerous tribes; and making inroads into Siberia, carry away with them vast quantities of plunder. During the winter they are all at home, but no sooner does the summer return; than they leave their habitations, and encamp, like swarms of locusts, in the Russian and Persian dominions.

The

The capital of the eastern province is called Tashkant, and is situated on the east side of the river Sir; it was a place of great antiquity, but has been often destroyed in the wars among the Tartars, and always rebuilt in times of peace. It is at present the residence of a khan, who marches every summer at the head of an army to plunder. The inhabitants of that part of Turkestan resemble the Calmuc Tartars, being of a middle size, but exceeding well made. Their faces are broad and flat; their complexions very swarthy; their eyes black and sparkling, and strongly resembling the Calmucs, only that their beards are thick, and their noses well shaped; they cut their hair, which is extremely black and strong, within four inches of the skin, and wear round felt bonnets about a span high.

Their cloathing consists of a coarse shirt, a pair of sheep-skin breeches, and a quilted vest of calico; but in winter they wear over these a sheep-skin cloak, which serves them instead of a quilt; their boots are made of horses skins; and their weapons are the sabre, the bow, and the lance; for as yet they know but little of gunpowder. They are, like the Tartars in other parts, very good horsemen; and they hunt and plunder on horseback during the summer, leaving their wives at home to look after their cattle.

They possess very fine lands along the banks of the river Yemba, which separates Turkestan from the country of the Calmucs; but all their thoughts being fixt on rapine, they cultivate very little for they seldom use any bread. They are continually at war with their pagan neighbours, the Tartars. In winter they pay a visit on one side to the Calmucs, subject to the khan of Great Tartary, who about that time ravage the frontiers of Great Bukharia, and

other parts to the south of their own country. At other times they invade the province of Astracan; but in summer they generally cross the mountains, and penetrate into Siberia. It is on this account that the Russians are obliged to keep guards in all the villages along the banks of the Tabor, and other rivers; to disappoint their schemes. They are often killed in those incursions; and even when they are fortunate enough to escape, all the plunder they can procure is not equal to what their land would produce, were they to cultivate it, which they might do in safety. And yet such are their wretched notions, and so destitute are they of honesty, that they chuse rather to expose themselves to many dangers, and undergo numberless hardships, to subsist by robbing, than apply themselves to a regular business, and live comfortably. They sell the slaves they take in those incursions to the Persian, Indian, and Armenian merchants, who repair thither solely on the account of that trade, which is the only one carried on with any security in these provinces. They seldom keep any of these slaves to themselves, unless they happen to pick up some Russian girls in Siberia, whom they make their concubines.

Their own women are large and well made, and although their faces are broad, and their noses flat, yet they are far from being disagreeable. They wear high pointed bonnets, which they fold on the right side, and they have large slippers; but in other respects their dress resembles that of the men.

Though they are all Mahometans by profession, yet they are extremely ignorant, having no books among them, nor do they know any thing of the Alcoran but what has been handed down to them by tradition.

TRAVELS THROUGH TARTARY, TIBET, AND BUKHARIA, TO AND FROM CHINA.

By Friar Carpini, and several other Persons of the same Order.

HAVING related to the reader every thing worth notice at present in these extensive countries, as related by the Jesuits Duhalde and Le Compte; we shall proceed to give an account of the state those people were in many years ago; in doing which, we have the assistance of some very curious materials.

The prodigious conquests made by the Monguls and Tartars under Jenghiz Khan, towards the end of the twelfth century, having made Tartary and its inhabitants famous through the continent; that vast region, which before was scarce known to the Europeans, began to be visited for the sake of trade or curiosity. But what principally opened the way to these undertakings, was the zeal, or rather folly and presumption of the popes, who took it into their heads to send some friars, by way of envoys, to the successors of the above mentioned conqueror, to persuade them to desist from their destructive invasions, and embrace the Romish faith.

With this ridiculous view, joined to a design of prying into the secrets of the Tartars, Pope Innocent X. sent Carpini, a friar, with several others of his brethren, to make what discoveries they could; and these being men who feared no hardships, but rather wished to undergo many fatigues in order to propagate their opinions, undertook the journey, not doubting but their labours would be attended with the most beneficial consequences.

Carpini writes as follows: "We set forward on

our journey, and were kindly received by the King of Bohemia, who sent messengers along with us to the Duke of Silesia; and, by the munificence of the latter, were conducted to Moscow, and kindly entertained by the Grand Duke of Russia. There we were informed that we must take presents along with us; and consequently, we provided ourselves with a considerable quantity of rich furs, of which the Tartars are extremely fond. We were obliged to hire sledges to be drawn over the snow, which at that time was almost as solid as ice; and we arrived at Kenow, the first town in the dominion of the Tartars, on the 4th day of February. Here we rested one night, and the next morning set out to another town; where we were received by the first guard of Tartars, who behaved very rudely, and were inquisitive to know who we were, and what was our business. Having given them all the satisfaction we could, they seemed pleased, and sent a party to conduct us to Korrensá, lord of the western marches, who had under his command sixty thousand men.

As soon as we arrived at his camp, we were conducted to his tent, where we bowed three times, with the left knee, before the door, taking care not to touch the threshold. Being entered, we repeated the substance of our commission, and presented the pope's letters kneeling.

From hence we were conducted to a grand chief, called Duke Bathi, who received us with great state and

and dignity. He was seated on a lofty throne; before him, but a little lower, sat one of his wives; and in the middle were his brothers, sons, and other relations. We were treated in the same manner as ambassadors generally are in that part of the world; and on Easter Sunday we set out for the court of Kuyne Khan, the third emperor of the Monguls. Here we were but indifferently treated; and both victuals and water were so scarce, that we were almost famished, and this reduced us to the lowest degree of weakness; but we found ourselves under the necessity of continuing our journey, which we did on Ascension day, and entered on the province of Bisermins, where we found vast numbers of ruined towns and castles; the roving Tartars from the northern parts having in a manner totally destroyed them. Here we travelled till we came to the banks of a prodigious lake, which had many islands in it, and it was much agitated by storms. We travelled ten days along the banks of it, till we came to the court of Ordu, the oldest of all the Tartarian princes. Here we presented the guards with some fine fables, and were conducted to the first court, where one of the emperor's wives resided. We were agreeably entertained for several days together, but were not permitted to go any farther than the outer court, because we had not yet seen his majesty.

Leaving this place, we travelled over many dreadful mountains covered with snow, till we arrived in the land of the Monguls, where we could not be admitted to the court for some time, because all the chiefs were engaged in the business of electing a new sovereign.

Five days after our arrival at this place, we were invited to a spacious tent, capable of holding above two thousand persons, and the whole was surrounded by a palisado, on which was painted a variety of figures. The palisado had two gates; one without guards, for the emperor to go in at; and the other through which all visitors were admitted; and here was a strong guard. The grandees having entered the tent, began to consult concerning the election till about noon, when they got to drinking mares' milk in surprising quantities. They desired us to drink along with them, but as we could not swallow such large portions as they did, they generously excused us.

The election took up no less than four weeks, at the end of which the new emperor was conducted to a plain between mountains near the banks of a river, where a stately tent was prepared for his reception. It was covered with cloth of gold, and the parts joined together with nails of the same precious metal, which, as the sun shone bright, made a most splendid appearance.

The whole company turned their faces towards the south, and repeated several prayers, after which they returned towards the tent, and kneeled before the new elected emperor; excusing us who were friars, because we had intimated to them that it was inconsistent with the principles of our religion. The emperor seemed to be a little turned of forty, of a middle stature, and had something in his countenance that seemed to mark him a man of gravity, discretion, and thought. He was affable and communicative; but although he often smiled in the most condescending manner, yet he never once laughed in our company. It did not appear to us that he was acquainted with any foreign languages, because he always spoke by an interpreter, who was either a Jew or an Armenian. His subjects never spoke to him but upon their knees, and in his titles he was stiled The Power of God, and the Emperor of Mankind; on his seal was engraven, "God in Heaven, and Kuyne Khan on Earth, the Power of God; the Soul of the Emperor of all Mankind."

The entertainment being over, we were called to an audience; but before we were permitted to speak to the emperor, we were all searched, lest we should have had any arms concealed about us. Then it was

that we presented our furs, and such other things as we had brought; for, without something of that nature, there is no possibility of being admitted to speak to an eastern prince. Besides us friars, there was a vast number of ambassadors from the dependent Tartarian princes; some from Russia, and others from Persia and China. On a neighbouring hill, near the place where the emperor's tent was pitched, we saw no less than 500 waggons loaded with presents; such as furs, fine cloaths, silks, and many other articles.

From this place we travelled four months through a desert, where we did not so much as see one tree; and at night were obliged to lie in the snow. Had it not been that we took provisions along with us, we must have perished, for there was no possibility of procuring any sort of subsistence.

The descriptions which the jesuits give us of these Tartars, is no way different from what has been already mentioned, only that they are somewhat more particular in some things relating to themselves, than either Duhalde or Le Compte. As there were several of them in company when they left Europe; so instead of the number decreasing, they continued to receive so many fresh supplies, by new ones being sent them, that they divided themselves into several parties.

Accordingly they were joined by Father Aselin, and three others, from Italy, besides a great number from France and other parts; and it was agreed, that this Aselin, and his three companions, should go on the mission into a different part of the country; agreeing to meet their brethren somewhere near the borders of China. Bold and daring as this scheme was, yet nothing could deter the jesuits from putting it in execution. Aselin, with his three companions, travelled first towards the northern borders of Persia; having learned something of the language of the country, which in many respects differs but little from that of the Tartars.

On the borders of Persia they met with Bayoth Noy, a Tartarian prince, encamped with a considerable army. This prince appears to have been a man of spirit; for no sooner did he hear that some strange men were arrived in the camp, than he ordered one of his attendants to take along with him an interpreter, and demand from whence they came, what was their profession, and what business they had with his subjects? Aselin answered, That he was ambassador from the Pope, who was the greatest in dignity among Christians, and honoured as their father. "We told them further (says Aselin), that the pope was the next person to Almighty God, and that he had sent us, his children, to make known to him and his subjects the way to everlasting happiness." The messenger, who had brought along with him several others, was much offended at our speaking in such a lofty manner of the pope; and asked us if we did not know the khan their master was the son of God; and that Bayoth Noy was his prince? We answered, That the pope did not know the names or titles of their princes, otherwise he would not have omitted them in the letters he sent. But that the holy father, the pope, had heard of so many murders committed by the Tartars, who knew not the light of the gospel, that he had in compassion sent us to beg that they would be baptized, that they might repent of their sins, and desist from committing murders and robberies for the future.

These messengers came several times to us, but always in different dresses, thereby attempting to make us believe that they were not the same persons; but we knew their voices, so that they could not deceive us. They were anxious to know what presents the pope had sent to the khan, and to his son, the prince who commanded their army. We told them, that the pope never sent presents to christians, who are his own children; much less to infidels, who ought rather to send presents to him, for making them an offer of everlasting happiness; which if they refused to accept, they would perish eternally.

We

We were commanded to kneel down before the prince Bayoth Noy; but that we absolutely refused to do, lest they should have imagined that we considered the pope as inferior to the Tartars; however, we told them, that we would shew their prince as much respect as we could, consistently with the principles of our holy religion; only that we could neither kneel down before him, nor acknowledge that the khan, his father, was the son of God. At this they were so much enraged, that they called the pope a dog, and we his puppies. We would have replied to these opprobrious expressions; but were prevented by the messengers, who made such a noise, that it was impossible for us to be heard. And, perhaps, it was well for us that we did not speak; for the prince Bayoth Noy was so much incensed against us, that he ordered us all instantly to be put to death. Some of his counsellors advised him to spare two of us; and some others advised, that I, being the chief, should be flay'd alive, and my skin stuffed with straw to be sent to the pope; some were for whipping us to death, and others were for setting us in the front of the army during the next battle, that we might be shot dead by the enemy.

At that instant Providence interposed in our favour, and in a manner we little expected. The prince had six wives, and she, who was the chief, had the good sense and humanity to represent to her husband, that he would bring lasting dishonour upon himself, if he persisted in his design of putting us to death; she told him, that the persons of ambassadors should be considered as sacred, and if he did us any injury, he would set up a precedent for other princes to murder his own. The princess was supported in her argument by some of the favourite courtiers, who represented to him what offence it would give to the khan his father. [It seems, this Bayoth Noy had once seized an ambassador, and with his own hands tore out his heart; after which, he caused the body to be dragged at a horse's tail through the camp.] They added further, that if he persisted in his design, they would retire from the army, rather than murder men for declaring their own sentiments; and they threatened to lay the whole before the khan his father.

A word spoken in season is good, and so it happened to us; for no sooner had the courtiers done speaking, than the prince revoked the sentence, and ordered us to withdraw. In about two hours afterwards several messengers waited on us, and asked us what sort of reverence we paid to our own princes: which we shewed them by pulling off our hoods, and bowing our heads. Then one of them said, since you christians make no scruple to adore stocks and stones, why do you refuse to do the same honour to Bayoth Noy, whom the khan has ordered to be adored equally with himself? We answered, that we did not adore stocks and stones, but only the sign of the cross in honour of Christ Jesus, who was crucified; some time after this, Bayoth Noy sent again for us, and told us, that he intended we should carry our letters to the khan his father; but this we refused to do, as we had no orders for that purpose. Our letters were then translated into the language of the Tartars, which is nearer akin to the Persian, and delivered into the prince's own hands, who still detained us, without assigning any reason for so doing.

This was in the summer; and though we made several applications to be dismissed, yet all was in vain; not satisfied with amusing us by frivolous pretences from time to time, they even went so far as to add insult to seeming indifference, and told us sneeringly, that as we had come to their camp, so we must stay till it broke up. Here we frequently waited whole days, from morning till evening, in the violent heat of the sun, and returned to our tent almost perishing with hunger, without receiving any answer, but were jeered, scoffed, and laughed at.

At the end of three months, Bayoth Noy sent for us, and told us, that he had ordered letters to be written to the pope; but he could not deliver them to

us till a lord came from the court of the khan, his father, whom he expected every day; this lord however did not arrive till the beginning of winter, when we resolved to make interest with one of the prince's favourites to attain our dismissal, and for that purpose offered her some presents. This had the desired effect; and had we known the tempers and dispositions of these people sooner, we should not have been detained so long; but no sort of knowledge is equal to that gained by experience.

At last we were dismissed; but instead of going towards China, to meet our brethren, we were ordered to travel towards Acra in Syria, where we arrived in about sixty days; but it was a long while afterwards before we landed in Italy, to deliver to the pope the letters written by the khan to his son, and the son's to our holy father. In these letters Bayoth Noy intimated, it was God's will the Tartars should subdue the world, and therefore those who would not submit must be destroyed, for opposing the divine command. He therefore advised the pope to come in person, and submit, otherwise God only knew what would be the consequence; but he added, that the pope must first send him some ambassadors, to acquaint him whether he will come or not.

The reader will naturally perceive in what manner these letters were considered by the court of Rome; a court established upon such principles as are inconsistent with the rights of mankind, or human beings, or of christians, who acknowledge no other sovereign but Jesus. It was little better than madness for the popes to send missionaries into heathen nations, with a crucifix in one hand, and a Latin breviary in the other; and equally ridiculous to persuade men to acknowledge themselves idolators, while they, the Jesuits, actually worshipped crucifixes. Nay, we may add farther, that the Roman Catholics will never be able to convert heathens to popery upon christian principles; for the changing of one ridiculous ceremony for another is equally absurd, and can only be compared to the conduct of the Romans, when they attempted to force the Iberians in Spain to worship such gods as had been deified in the capitol. But this leads us on to another part of the narrative, which we shall extract from the journal of Rubruquis, who travelled into Tartary soon after the missionaries just now mentioned. This Rubruquis was a Franciscan friar; and being fired with zeal to propagate his favourite tenets, he set sail from Italy, and landed at Constantinople, where he was kindly received by some of the Greek christians, who approved of his scheme of going into Tartary, although none of them would consent to accompany him. Leaving Constantinople, he took shipping on the Euxine or Black Sea; and having crossed it along with some other friars in his train, they all landed in the province of Kersona, where they were obliged to cross a vast desert.

On the first of June (says this friar) we arrived at Sadaia, where we refreshed ourselves till the twenty-first of the same month, in order to concert proper measures for prosecuting the remainder of our journey; there we procured four covered waggons for our baggage, and two more for our bedding, all drawn by oxen, who are extremely useful in that part of the world; because they are patient in enduring any sort of fatigue. We had likewise five horses to carry presents; and had a young lad named Nicholas, whom we bought at Constantinople.

Having passed a long ridge of mountains, we entered a plain inhabited by the Tartars, five days journey in length, which brought us to the end of the province which there terminates in a narrow neck of land, like a great wall between two seas. This plain had been originally inhabited by a body of people called Komans, whom the Tartars drove out from thence; these Komans fled towards the sea coast, where they were reduced to so much distress, that they ate one another like canibals, and now nothing remains of them but their name. At the end of this country we saw great lakes, of the waters of

which the inhabitants make salt, and this they sell to the Turks at a considerable profit.

Leaving this plain, we met, for the first time, a large body of Tartars, who were very inquisitive, and seemed importunate to know what gifts we intended to give them, but they did not offer to take any thing by force. Next day we came to the court of Skakatay, brother of Baatu, a Tartarian prince, to whom we had letters of recommendation from Constantinople. The whole of this prince's court consisted of huts, waggons, and a vast number of cattle, but he had not above five hundred men in his retinue. We found him sitting in his bed with a guittar in his hand, and one of his wives beside him. His nose was so short, that we thought it had been cut off, but in the end we found that most of his subjects resembled him; which induced us to conclude that they force down the noses of infants while they are young. He accepted a present from us of a few biscuits, some dried fruit, and a bottle of brandy, which he distributed among his attendants; and when he heard us explain to him the Christian faith, he shook his head, without saying any thing.

We continued with him several days, and in the mean time a large body of people arrived, who are called by the Tartars, Alars; but on conversing with them, we found them to be Greeks. We had not much conversation with these people, for they left the place in a few days; and we continued our journey to the end of the country called Gazaria, where we found the place of residence for those officers who were appointed to receive the duty on salt. These men treated us with great civility; for after informing us that we should meet no people for fifteen days, they gave us two oxen, with a great number of bladders filled with mares' milk. Travelling eastward, we arrived at the end of twenty days at another Tartarian camp, where there was abundance of cattle, and such other provisions as the country could afford. Here we attempted to explain to those people the principles of the Christian religion; but our interpreter, who was a heathen, deceived us; for whenever we told him what to say, he repeated something altogether different.

Finding we could do no good in this place, we continued on our journey as far as the river Tanais, which separates Asia from Russia, and we found it as broad as the Seine at Paris. On the east side was a cottage, where, by order of Baatu and Sartak, several men attended to ferry over ambassadors and merchants. These men crossed first, and then having fastened two boats together; they put one wheel of a waggon into one boat, and the other wheel into the other, and so carried them over.

Here we staid three days, and purchased such provisions as we imagined we should be in want of; and amongst other things a very large turbot, which we found to be extremely good, not having tasted any such fish for some time. But our ignorant guides not considering that we intended to travel farther, sent back our horses unknown to us, so that we were obliged to travel four days on foot. On the fifth day we procured horses and waggons, and soon after we arrived at the court of Sartak, which is about three stages from the Wolga. From thence to the Tanais the country is extremely fine, and watered with several beautiful rivers, affording abundance of the most excellent fish. The inhabitants are divided into two sorts; namely, the Moxel, and the Mahometans. The Moxel are pagans, and dwell in cottages in the woods, and they procure a subsistence mostly by catching wild beasts, at which they are very dexterous. As for the Mahometans, they have some small towns, but no mosques in them; for although they profess themselves to be of that religion, yet they are extremely ignorant, knowing nothing more of the Alcoran than what has been handed down to them by tradition through many generations.

Sartak's court appeared very splendid; for, besides a vast number of attendants, he had six wives, and his

son had three. All these women lived together in one house; and as they travel from one part of the country to another, each of them had two hundred waggons. We were introduced to his secretary, whose business it is to receive ambassadors, and he treated us with much more kindness than we expected. When we told him that we had no presents left, he answered, that he did not desire any; adding, that he would rather give us what assistance he could, than receive any thing from us. Next day we were ordered to attend on Sartak in his tent; and accordingly we went dressed in our surplices, singing a Latin hymn, in honour of the blessed Virgin. He viewed us with great attention, and asked us several questions concerning our books and images; for he never heard of any such things before. It is true, there were several Armenians in his court, as well as some Greek priests, but neither of them seemed to know much of the catholic religion; for as they would not acknowledge the supremacy of our holy father the pope, so we were obliged to consider them as heretics.

Along with these Armenians and Greeks was a Knight Templar; and Sartak, who did not seem to relish their company, sent them away under a strong guard, to Baatu his father; but obliged them to leave all their waggons behind them. We staid only a few days after this, and then set out for the court of Baatu, where we arrived in ten days, being much afraid of robbers, of which there are always a great number in those parts.

The court of this province filled us with astonishment, for we had never seen any thing like it before: it consisted of a vast number of huts and tents, extending about three miles in length and one in breadth, and filled with such vast numbers of people, that it had the appearance of one of the largest cities in Europe. These Tartars had their huts constructed in such a manner, that they could put them up in waggons, and remove them from one place to another with all the ease imaginable; so that they were much like the tents made by our soldiers. Baatu's tent was placed in the center, and round it were tents for his courtiers, who were extremely numerous; the apartments for the women being locked, but they are not under such restraint as in China and Turkey.

Baatu having sent for us, we made our appearance before him in his tent; and as we were bare-headed and bare-footed, with our clerical robes, the whole assembly gazed at us with seeming astonishment. The prince sat on a seat like a bed, gilt all over, with one of his wives, who probably was the most beloved, beside him. He had a fresh, ruddy complexion, and, looking earnestly at us, ordered us to speak. Then our guide desired us to kneel on both our knees, which we did, and prayed earnestly that God would convert Baatu to the faith of the holy catholic church.

Our interpreter having explained the words of our prayer, the prince seemed to smile; but his attendants burst out into loud fits of laughter, clapping their hands, and jeering us with every mark of contempt. Baatu, however, ordered our letters of recommendation to be read by our interpreter, and then we were desired to withdraw to a tent prepared for our reception, till such time as he should consult with his courtiers concerning what answer he was to give us. Thus we were left intirely in the dark concerning what was to happen to us; and what was the worst of all, we had never yet been able to make so much as one single convert to the holy Roman-catholic religion.

Having continued several days longer in this court, or rather camp, our guide came to inform us, that as we desired permission to stay some time in the country, Baatu could not grant it without the consent of the khan or emperor, so that it was necessary for us to repair to his court. Accordingly we set out with our interpreter, Baatu himself having been so obliging as to accompany us. Our journey, which took up no less than five weeks, was along the banks of the Wolga, and during that time we were almost starved to death for want of provisions.

At length, on the 16th day of September, we departed for the court of the khan of Great Tartary, which was a journey of four months; and we were obliged to purchase for ourselves warm gowns, with leather breeches, and boots made of sheep-skin, with the woolly side turned inwards. About the beginning of November we found ourselves in a country inhabited by a body of people called the Kankle; and their country Kangle. They were formerly subject to the Romans; but now they do not retain one single idea of the manners of that warlike people.

These people live in huts, and speak a strange language, which has a near affinity to what we call the Slavonic; and from this part of the world many of those barbarians came who overthrew the Roman Empire, and established sovereignties on its ruins.

In our journey through this country, we suffered much from the severity of the cold. Our guide was a man of some repute in the country, who at first treated us in a haughty scornful manner; but our behaviour was so submissive, that at last it softened his heart, and made him look upon us as somewhat more than human.

Thus artists melt the fullen ore of lead,
With heaping coals of fire upon its head:
In the kind warmth the metal learns to glow,
And, loose from dross, the silver runs below.

The chiefs of the Monguls, who inhabit great part of that extensive desert, treated us with every sort of respect, and often desired our prayers. They offered us all sorts of provisions gratis; but we would not accept of any thing but what we paid for.

They told us, that several persons from their country, who had travelled as far as Constantinople, had informed them, that the pope was five hundred years of age; which convinced us, that they had heard something of Jesus Christ. From this part of the country we turned more to the southward, and crossed several steep mountains, where we were often in danger of being dashed to pieces over precipices, or devoured by wild beasts. On these mountains we saw many asses as large as common horses, and so swift, that our guide was not able to catch one of them.

About the middle of September we entered a large plain surrounded by mountains, at the end of which we came to a town called Kerkat, where the governor met us at the gate, and treated us with ale. A great river descended from the mountains, which, being cut into several canals, watered the whole country, and ended in a most beautiful lake, where we found some of the best fish we had tasted since we came into these parts.

Having rested ourselves at this place, we continued our journey towards the east, along a ridge of mountains that join to the Caspian Sea. Here we came to a village, and made enquiry concerning some Dutchmen, who lived at a place called Tallas; but all we could learn was, that Ban, their lord, had been put to death by Baatu, in whose jurisdiction he lived, for speaking disrespectfully of him; and that the rest of his countrymen were removed to Balak, a village a month's journey more eastward. It seems these Dutchmen had been informed, that there were gold mines in those parts of Tartary; but they were mistaken, and most of them perished in the search.

Continuing to traverse this vast desert, we came to a village called Equins, inhabited by Musulmen, or Mahometans; and they spoke the Persian language. Near this village we had several mountains to cross; after which, we came to a most beautiful plain, and soon after arrived at the ancient city of Koylak.

In Koylak were three idol temples; and in one of these, we were shewn an image placed behind the altar, in the form of an angel with wings. Around it were several other images, most of whom had their hands clasped together in a praying posture,

or rather as going to bless their worshippers. The doors of their temples are always open towards the south; and though we found them built length-ways from east to west, yet their priests, as well as the people, worship with their faces towards the north; prostrating themselves on the ground, and making the most hideous lamentations. Their priests, who have their heads and beards shaved all over, live together in a convent; and in their temples they wear yellow garments. They sit on benches in their temples, each having a string of nut-shells in his hand; and they frequently repeat the words, "Lord, thou knowest!" which is considered by them as having something in it of a very meritorious nature.

Their temples have square courts, opposite the front doors to the south; and there the priests, whose cells are on each side, sit and converse together. They write from the top to the bottom, and multiply the lines from the right hand to the left. They burn their dead, and deposit the ashes in an urn, which is fixed on the top of a pyramid, near the gates of their temples; and they believe that there is one Supreme Being, who has a great many deputies to act under him.

Departing from Koylak, we came to a ruined village, where we found the remains of a castle; and about three days after, we crossed near the end of the lake, which we found to be almost as boisterous as the sea. Near the borders of this end of the lake was a small town inhabited by Nestorians, who are very numerous in these parts; and they had a church, where their priests said mass. Here the wind was so strong and boisterous, that to avoid being blown into the lake, we turned northward, into a hilly country, almost covered over with snow. There were several huts at the bottom of the rocks, in which lived peasants, who conducted us from one stage to another; for they were given to understand, that we were going to the court of the emperor. Next day, as we passed between frightful rocks, our guides came and advised us to speak some words to drive away the devil, who in that place, they said, often carried men off from their horses, and sometimes tore out their bowels. Upon that, we repeated the creed; which had such effect, that the devil did not approach to hurt them; and the guides were so sensible of what we had done for them, that they begged us to write out copies of the creed for them to stick in their caps, and keep them as preservatives.

From this place we travelled more towards the north-east, through a hilly country, and then entered a great plain, which, at a distance, looked like the sea. At the further end of this plain, we came to the court of the great khan, or emperor, where our guide had a large house allotted him for his residence; but we were crowded together in a small hut, where there was scarce room for ourselves and our baggage. The weather was so cold, that (though contrary to our order) we were obliged to wear shoes, which we made of pieces of horses hides, keeping the hairy side next to us.

On the 5th of January, we were brought to the court of the emperor, and placed in a tent covered before the gate with rough skins of sheep, horses, and bullocks. It being Christmas season, and we being earnest to convert these people to the faith, we sang to them an hymn in Latin, but they did not seem much to regard it.

The servants or guards who waited at the gate, searched us for knives; but finding we had none, they conducted us into an apartment, where we were seated on benches, and the khan's wives came and looked at us. The room was hung with cloth of gold, and in the midst was a fire, made of thorns mixed with ox-dung. The khan sat on a bed dressed in a robe of spotted fur, which shone as transparent as if it had been a seal-skin. He was of a middle stature, flat nosed, and about fifty years of age. His principal wife sat next to him; and near her, was her eldest daughter, and several little children. Nei-
ther

ther the women nor the children had any thing in them that was engaging; for, besides their flat noses, they were of a swarthy complexion, low of stature, but robust, with large eyes, and hard features.

The khan desired our interpreter to ask us what liquor we chose to drink? at the same time naming four different sorts; and as we were equally strangers to all of them, we took what was recommended to us, which was called *serafina*, a liquor made of rice; it was mild, clear, and tasted very much like white wine. We told the khan, that we had been sent by Baatu to the court, and that our chief design was, to convert his subjects to the Christian faith. The emperor answered, that his power was great over all the east, and that we might remain as long as we pleased in his dominions; which led us to take notice of some things that happened both before we came, and while we were there.

About a year before we arrived at the emperor's court, two friars, the one named Theodolus, and the other Andrew, came into Tartary, having travelled from Syria, all the way across Persia. Andrew, not liking the country, returned home; but Theodolus, who was an artful man, pretended that he had received letters from the king of the Franks, written on gold, which he was to deliver to the emperor; but that the horse he rode upon had broke loose, and ran away with them.

Having promised to conduct ambassadors to that king, the khan caused a bow to be made, so strong, that two men could hardly bend it; and two arrows with silver heads, and full of holes, which caused them to whistle as they flew through the air. These he delivered to a Mongul, ordering him to present them to the king of the Franks, and tell him, that in case he entered into a league with him, he (the khan) would subdue all the Mahometan countries that lay to the westward of his dominions, and give them up to be governed by the Franks: but in case he refused, then the envoy, instead of delivering the bow, was to tell the king, that his master could shoot far with it, and do a great deal of mischief. This Mongul, who acted as ambassador, set out, accompanied by Theodolus, for the court of the king of the Franks, with an interpreter along with them. They travelled several months together, till they came near the borders of Syria, when they discovered that this Theodolus was an impostor, and that he intended to carry them by sea to the pope. Accordingly they applied to the governor of the place, who caused Theodolus to be imprisoned; but in the mean time the ambassador and the interpreter died.

Here we found a great number of Nestorian Greeks, one of whom, a monk, called Sergius, told us one day, that he was going to baptize the emperor. We begged to be permitted to see the ceremony, which Sergius promised we should; but when the time appointed came, he did not come near us. However, we went in the evening to the court, where we found Sergius, with the cross in his hand; when he told us, that he had baptized the emperor; but that was false, for although the khan suffered all sorts of priests to visit him, yet he never admitted any ceremonies to be performed except his own, which were heathen.

The khan's first lady, who was a Nestorian, and had a son whom she brought up in the principles of her own religion, had a chapel where she went to mass, and where many abominable ceremonies were used. All the people bathed themselves at the door of the chapel; and as soon as the priest had finished their service, liquors were set before them, and they got intoxicated so much, that they were rather like beasts than men.

Soon after this, the queen was taken dangerously ill; and though she was a Nestorian, yet the khan loved her so much, that he sent for Sergius the monk, who undertook to cure her. We attended to the methods used by him; which were as ridiculous as any we had ever seen practised by mountebanks. Having cut some rhubarb very small, he put it to steep in water along with a crucifix; and by this he said, he knew whether the patient would live or die;

for if she were to recover, it would stick to her breast like glue, but if she were to die, it would not stick to it at all. We were of opinion, that it would be much better for him to suffer us to anoint her with holy oil and water, that being our remedy for all sorts of diseases; to which Sergius consented.

Accordingly we spent the whole night in prayer; and in the morning we waited upon the lady, whom we anointed, and she soon found herself much better. Next day the khan sent for us, and we found him sitting in the midst of his servants, sipping something like paste. He told us, we might carry our cross on the top of a lance or spear, so that it might be seen by the people. Proceeding from thence, we went to the lady, whom we found hearty and well, but we thought it most proper to repeat our remedies. We had amused ourselves with the hopes of seeing the king of Armenia, as we had been told we should, together with a Dutch priest from Balak; but hearing no news of them, we applied to the khan for information. We could not however bring any intelligence concerning them; and as the winter was near approaching, we resolved to leave the country: This we found the more necessary, because, after we had done every thing we could to convert the inhabitants, we had not been able to make one profelyte; for the Nestorian monk would not permit us to converse with the queen, whom we had healed; and as for the emperor, he was continually surrounded by pagan priests. This prince ordered each of us a warm garment, with every thing necessary for our journey, and gave the interpreter money to defray our expences on the road.

Leaving the khan's court, we travelled above twenty days, and then learned that the king of Armenia had passed us, he having taken another road. Travelling still farther, we arrived at the Tartarian camp, where Baatu commanded, after having been absent from it exactly one year. We suffered much in this journey to Baatu's camp, for we frequently met with Tartars near the mountains, who asked us if we could take care of horses, and milk mares, upon which we concluded that they intended to make slaves of us.

Baatu treated us much better than when we visited him first; for having called us into his tent, he ordered his secretary to read the letters he had written to the king of France; and when our interpreter had explained them, he sent some of his men, who conducted us four days on our journey, and then left us. Having travelled a month longer, we came to the borders of Persia, where we found the Wolga divided itself into seven streams, so that we were obliged to cross as many ferries. Two days more brought us to Samaron, a city mostly inhabited by Jews, where we refreshed ourselves one day, and then continued our journey southward, where we saw the ruins of walls, which reached from the top of the mountains to the sea. All along we met with hords of Tartars, especially near the banks of the river Araxes, which we crossed on a bridge of boats chained together. Near this place, and adjoining to the banks of the river, we were shewn the mountain, called in scripture Ararat, where it is said the ark rested, and the Armenians firmly believe it. It is now called Semainum, which signifies Eight, alluding to the preservation of Noah and his family during the flood.

Near the bottom of this mountain is a town called Naxuan, where we met with two friars of our order, who had been confined there a long while during the winter, the snow being so deep, that they could not travel. In fifteen days more we entered the Turkish dominions on the first Sunday in Lent, where we found several towns, in which were more Greeks and Armenians than Mahometans.

The second Sunday in Lent, we came to the head of the Araxes, which rises in a mountain, beyond which there is a fine city, called Arzerum, and near it, on the north, the Euphrates has its source; but the snow

snow was so deep, that we could not reach it. This year there happened such a dreadful earthquake at Arzerum, that upwards of ten thousand persons perished; and such was the violence of it, that mountains were torn in pieces, and in one place it formed a lake. Fifteen days more brought us to Iconium, a place we might have arrived at sooner, had not our guide, who was an Armenian merchant, stopped at every town to dispose of his goods, and to purchase others.

Here we met with many people from Italy, France, Spain, and Portugal, and indeed from most parts of Europe; and the Christians were far more numerous than the Mahometans.

We continued in Iconium a month, whence we set out for Antioch, where we met with many of our own brethren, to whom we communicated an account of our travels; and they sympathized with us for the numerous hardships we had suffered. From Antioch, we set out for Tripoli, in Syria, where we found a ship under sailing orders for France, and would have taken our passage home in it, but were forbidden by our provincial, who had sent letters commanding us to go to Akon, or Akra, there to remain till we had received farther orders from him. We were obliged to obey, for there was no disputing his orders; and, after much fatigue, we arrived at the place, where we wrote an account of our travels, and sent it to France, desiring the king to intercede with our superior to let us return home to Europe. This we thought the more necessary, as we saw no probability of converting any of the infidel Tartars; and as for the Turks, it is death for any of them to embrace any religion besides that of Mahomet.

Thus far these friars have given us an account of their romantic expedition, and the success which attended it exceeded what might have been expected.

It did not, however, deter others of their order from renewing their endeavours to convert the Tartars, and, just like those who had gone before them, they resolved to pursue the same course, and to use the same means.

Accordingly, during the reign of Baldwin II. emperor of Constantinople, Marco Polo, a Venetian priest, accompanied by his brother Maffio Polo, embarked at Venice, and sailed to the Euxine or Black Sea, where they took in fresh provisions, and continued their voyage till they came to the northern borders of it. There they landed, and travelled to the confines of Armenia; but they have left us no account of their travels till they entered that kingdom; for it seems to have been their design to confine themselves to what they saw in the east.

“The first country we entered (say they) was Armenia Minor, where we were well treated by the inhabitants. We staid some time at a town called Jazza, a considerable place, and much frequented by merchants from Tartary, Persia, and Russia. The inhabitants were for the most part Armenian Christians; but they differed much from the catholic church. Here we found some Mahometans, and a considerable number of pagans, who offered sacrifices of the flesh of animals, with bread, wine, and several other things, such as fish, and the fruits of the earth. Their temple stands without the town; and when they have eaten part of the sacrifice, a second part of it is burnt, and the third reserved for the priests.

As for the Armenian Christians, their priests are very numerous; but so ignorant, that many of them cannot write. They have great numbers of convents among them, both for monks and nuns, but they may leave their order when they please. The clergy are obliged to marry before they enter into orders; but when their wives die, they must never marry a second wife; for were they to do so, they would be obliged to turn to some secular employment, which custom is of great antiquity among them.

From thence we proceeded to visit the antient city of Taurus, more towards the borders of Persia, but found nothing in it worth notice, although it has in

former times been a place of considerable strength, and much celebrated in history. In seventeen days more we arrived on the borders of Persia, and entered at a place called Izad, famous for quarries of those stones called turcois, so much valued by our artists in Europe for sharpening their tools. Throughout that part of Persia, over which we travelled, we saw vast numbers of fine horses; and such as, we believe, were not to be found in the world beside. The next place we visited was a small town, where we found ourselves in Tartary, but we had a vast plain to cross; where we were almost famished for want of provisions. The oxen in this plain were the largest we had ever seen, and they had a sort of humps on their backs; and the sheep are almost as large as our ordinary asses, with prodigious huge tails; which trail on the ground. A little further we found a vast number of small towns; but as the Tartars are often at war with each other, it is not safe to stay in them. There are also a set of people who infest this part of the country, called Karaons, who encamp in armies, sometimes ten thousand each; and when they meet with any of the small hords of Tartars, they either cut them in pieces, or sell them as slaves. At the end of the plain, which is five days journey in length, a great part of the road is so bad; that it is almost impassable. Then we entered the fine plain of Ormuz, which brought us to the sea, where we saw the island of Ormuz, on which is the city of that name. It is the capital of the kingdom of Kermain; and the province pays an annual tribute to the Tartars; which consists of the produce of the country. There are continually vast numbers of merchants resorting hither, from almost all parts of the east, even as far as China; and sometimes they travel in caravans of two thousand each; for without that cautious measure, they would be robbed and murdered by the Tartars. This manner of travelling is of great antiquity, and was used in the east, so long ago as the time of Solomon, when the queen of Sheba came to Jerusalem to visit that illustrious monarch.

The next place we visited was Kobinam, a populous town, but built in a very unhealthy situation; for the water is brackish, which occasions the death of many travellers, who in consequence of drinking of it are seized with fluxes. In this place we found men employed in making mirrors of steel. This seems to have been an antient custom in the east, and known many centuries before the art of making glass was discovered. Leaving this place, we travelled eight days over a barren desert, yielding only a bitter water; so that had we not carried provisions along with us, we must have perished. At the end of this desert, where we were told the battle was fought between Alexander and Darius, we entered the province of Keshmur, where we found that all the people were idolaters, except a few who called themselves Mahometans; but they had no mosques. The idolaters eat the flesh of animals raw; but they will not kill any themselves, that being done by the Mahometans. They have a prince of their own, who is not subject to the emperor of Tartary; and although the people are heathens, yet they have great numbers of hermits among them, who live in woods, and subsist on fruits and herbs.

The chief city of this province is called by the same name. But it does not contain any thing remarkable; and as for the men, they are employed, during the greatest part of the summer in robbing their neighbours. Travelling three days more to the north-east, we crossed a large river, and came to a lofty mountain, the highest we had ever seen. Near it was most charming pasture for cattle; and here we saw sheep with horns of a most enormous size, of which the Tartars make several different sorts of instruments.

There are many mountains beyond these plains, all which we were obliged to cross; but during several days we saw neither men nor women. We were afterwards told that the tops of the mountains had

several huts built on them, where some barbarous Tartars resided; but we were so happy as not to see any of them.

Beyond these mountains, we came to the province of Kaskar, five days journey in length, and subject to the great khan or emperor of Tartary. Here the soil is fertile, producing vast quantities of fruit, wine, cotton, hemp, and flax. The inhabitants carry on a considerable merchandize; and, besides the generality, who are heathens, we found here several Mahometans, and Nestorians. The churches of the Nestorians are but poor huts; nor are the mosques belonging to the Mahometans much better.

The capital city of this province is called Samarkan, and is most pleasantly situated in a fine open plain, and surrounded with a vast number of beautiful gardens; the worst thing we found in this river was the water, which was not only disagreeable to taste, but very unhealthy, occasioning fluxes, and other violent disorders. Nor is it much to be wondered, that we who were only strangers should be troubled with it, when it has such an effect on the natives, that they are often afflicted with sore legs, and swelled throats.

More towards the north east, we came to the province of Kotam; so called from a city of that name, where there are continually a great number of merchants. The chief commodities they deal in, are, wine, cotton, hemp, and corn, of all which, the country produces large quantities. This province is about eight days journey in length, and very populous; all the inhabitants being heathens, except a few, who are Mahometans; and they are subjects to the khan of Tartary.

There are a great number of forts built here, where the people take shelter when they are in danger of being robbed; for although all these hords of Tartars profess to be obedient to the khan, yet they pay so little regard to his authority, that they plunder each other. Here is a fine river in this province, famous for producing a vast number of precious stones, such as jaspers, chalcedonies, and many others. If a man goes from home and continues about twenty days, his wife may at the end of that time marry another husband; and the husband is indulged with the same liberty, if the wife is absent an equal number of days.

Travelling still more to the eastward, we arrived at Lop, a very considerable city, subject to the emperor of Tartary, and situated near a great desert of the same name, which requires no less than a month to cross it. The road is over vast heaps of sand; and though there are several springs of water, yet they are all extremely bad, and, like those formerly mentioned, they occasion many disorders. There are neither beasts nor birds to be seen here; and the reflection of the sun upon the sand makes the whole appear as the sea.

Having crossed the desert, we came to a Tartarian city called Sakion, in the province of Tangut; where we found that most of the inhabitants were Pagans; but there were some Mahometans and Nestorians. The Pagans had vast numbers of temples, and in them were images, which made a most dreadful appearance. The inhabitants never apply themselves to any trade whatever, nor are they concerned in carrying on merchandize, which is the life of society, and tends towards the civilization of their manners. In some of the other parts of Tartary, there are merchants constantly to be met with from most parts of Asia; and as there are none here, the reason seems to be, that either there is nothing to be had worth purchasing, or, which is equally probable, they are afraid of bringing their goods to the market, lest they should be robbed. The most remarkable thing we took notice of was, that these Pagans have convents, where a sort of monks reside, and live upon the generosity and charity of the public.

When a woman is delivered of a male child, he is consecrated to some idol, and put under the protection

of that imaginary being which it represents; and a lamb, destined for sacrifice, is bred up one year in the house of the parents; at the end of which time, both are presented in the temple, where the child receives a blessing from the priest; but the lamb is kept for a solemn execution. The beast being killed, some of the blood is offered in sacrifice, but the flesh is eaten; and the priests dispose of the head and skin. They burn the bodies of their deceased relations on particular days, appointed by their astrologers, keeping them till that period arrives, locked up in chests. They are not permitted to carry a dead corpse out at the door of the house; but when the time arrives for the funeral solemnities, they break an opening in the wall, which answers the same end. During the funeral procession, there are several sheds and booths erected in the way, to regale the mourners with food, wine, and such other necessaries as may be wanting.

When they come to the funeral pile, they burn, along with the body of the deceased, all the images which he adored when living; because they imagine that these idols are appointed to conduct them into eternity. With respect to this ridiculous ceremony, we find many instances of it in the histories of ancient nations; and the whole may serve to point out, that it was left for some particular persons in the present age to deny the immortality of the soul. Why all this care for, and all this respect shewn to the dead, unless there are some hopes of a resurrection! but the consideration of these things are at present foreign to our purpose. In pointing out the religion, laws, manners, and customs of heathen nations, we could wish that the reader might be led to the proper study of history, which alone, if rightly improved, can make him acquainted with the divine attributes, and oblige him to acknowledge that the wisdom of God is equal to his justice.

From this place we continued our journey more to the eastward, till we came to the province of Khamul, where there is a city of the same name; and almost wherever we came, we met with numerous hords of Tartars, who were roving from place to place, in search of plunder. We likewise saw many ruined castles, which may serve as so many monuments of that devastation which time has made; for we may naturally conclude, that the inhabitants of this part of the world were once formidable; nor do we see any reason to doubt but they had been partly subdued by Cyrus the Great, after which, the victorious Romans under the Emperor Trajan brought them into subjection. That some part of Tartary made a district of the Roman empire under Trajan, cannot be disputed; for in his time the Romans had made so many conquests among those whom they called the Barbarians, that Rome itself, once the pretended mistress of the world, sunk under her own greatness.

The province of Khamul borders on two deserts, one of which is three days journey in travelling over. It affords all the necessaries of life; but the inhabitants are mostly idolaters, and the women spend the greatest part of their time in singing and dancing before the images which they have in their temples. When a traveller puts up at a house, the master or landlord orders his servants to obey him in all things during his stay; and the guest is permitted to lay with the wife of his host, with his daughters, or any other in the family upon whom he has placed his affections. Barbarous as the people in this part of the world are, yet the custom here alluded to was for some time not much relished by them; and therefore they petitioned the emperor of Tartary to get it abolished; but that prince, from motives of state policy, paid no regard to their requests; and at present it continues what it was many years ago, and is likely to continue so till the manners of the inhabitants are civilized.

Proceeding in our journey more to the eastward, we arrived in the province of Kinkin-talus, which is about sixteen days journey in length, and abounds with every necessary of life, if the ground was but properly cultivated;

cultivated; but the inhabitants are so thievish and lazy, that they rather chuse to go out in parties to plunder their neighbours, than by honest industry seek for a subsistence at home. There are several rich mines in this province; but the people do not know how to work them to a proper advantage. The asbestes is frequently met with in the rocks in this country; and as that natural curiosity is but little known, we shall here give the following account of it.

In almost all the northern countries there is a particular stone to be found, called asbestes, which, being rubbed between a person's hands, turns into the form and consistency of flax. From this a thread is spun, which may be worked into aprons, handkerchiefs, gloves, &c. and, instead of washing it, it is thrown into the fire, where it purifies itself, and becomes as clean as ever; what is here related, is so far from being a fiction, that there is not a naturalist but knows the truth of it. In the British Museum, there is a stone, dug up in the county of Ross, in Scotland, which is the same as the asbestes; along with it, is some of the flax, as well as a hank of the thread, and a pair of gloves worked from it. The ligaments are fine, but the whole assumes a sea-green colour when it has been worked. We thought it the more necessary to take notice of this, because there is nothing more common than to hear those who have visited foreign countries ridiculed, merely because they have related facts which did not frequently take place at home; whereas, there are so many different things to be seen on the surface of this terraqueous globe, that the life of the oldest man is not able to record them.

From this country, proceeding still eastward, or rather more to the north-east for ten days together, we came to the province of Sabuir, where we saw many ruined towns, villages and castles. The country is as fertile as can be expected in that part of the world; producing wines, corn, and rhubarb, and many other things in great abundance. Several merchants from the east, such as China and the Empire of the Great Mogul, come hither to purchase drugs; but they are obliged to travel in large caravans, otherwise they would run the hazard of being murdered.

The idolaters in this part of the country have many temples; but though these are miserable huts, yet they are adorned with images, well carved, and gilded over. Most of them are in stone, fixed upon pedestals before their altars; but nothing is more common than to throw them into the streets when they do not comply with the requests of their votaries. This practice is very common among heathens; so that we need not say any thing more concerning it.

The men are permitted to marry as many wives as they can maintain; and as the women bring no portion with them, so the barbarous custom prevails of granting the husband a privilege to turn off his wife when he pleases. They marry the nearest relations, except fathers, mothers, or children. The truth is, they are but little better than in a state of nature; the laws of society being feeble, and consequently the people have no relish for those arts which ennoble the human character.

From Kampion we continued our journey more to the north-east; and in twelve days arrived at the city of Ezina, situated on the banks of a river of the same name. The inhabitants are all idolaters, and we could not find that they paid any regard to trade, most of them spending their time either in idleness, or in supporting themselves by plundering their neighbours.

To the north of this city is a sandy desert of forty days journey, which we crossed; but were obliged to take provisions along with us. It was with much difficulty that we could procure grass for our camels; for though we saw numbers of wild asses, yet those creatures subsist chiefly on weeds and herbs, which they pick up from the clefts of the rocks. At the

further extremity of the desert, we came to the city of Kara-koram, situated to the north of it, and above three miles in compass, having a strong earthen wall; for in this part of the country stones cannot easily be procured. Near the city is a strong castle, and within it a palace, where the governor of the province resides, who is appointed to his office by the grand khan.

It was near this place that the antient Tartars used to assemble their armies, for they dwelt to the northward. At that time they had no prince of their own, but paid annual tribute to Prester John, whom we have already taken notice of; but as they daily increased in power and numbers, that prince became jealous of them, and resolved to disperse them.

Upon this, the Tartars fled to the deserts still more to the northward, where they chose for their leader Chinghiz-khan, a wise and valiant prince; and the whole nation were so much charmed with his equity in the administration of justice, that they cheerfully submitted to be governed by him. Thus strengthened, he passed southward; and having subdued many provinces and cities, requested in marriage the daughter of Prester John, whom the Tartars call Um-kan. That prince, enraged that his vassal should make such a demand, threatened to put him to death if he repeated it. Chinghiz, however, was not to be intimidated, for he marched southward to the plains of Tanduk; and having consulted his astrologers, who splitting a reed, wrote on one of the pieces Chinghiz, on the other, Um-kan; and sticking them in the ground, mumbled some prayers over them. At length the reeds beginning to move and fight, Chinghiz bore down the other; upon which it was predicted, that he would be victorious. Accordingly the event took place, for Prester John having advanced with a great army, lost the battle, and was slain. The conqueror reigned six years after this, and subdued many provinces; but at last was killed by an arrow shot in his knee, and was buried in the mountain Altay.

Leaving Kara-koram, and the mountains Altay, we came to the plains of Bargu, which extended sixty days journey more towards the north-east. The inhabitants are called by different names, there being many hords or tribes of them, but they are all subject to the khan. Their manners are much the same with those of the rest of the Tartars; for they live chiefly by hunting, fowling, and plunder, but almost totally neglect agriculture. Here we saw a strange species of falcons, called astori, but they are reckoned a great curiosity, which is the reason that such as are taken of them are sent to the emperor's court.

Leaving this part of the country, we turned more towards the south-east, and arrived at the city of Singni, capital of a province of the same name, and subject to the great khan. Here we saw wild oxen almost as big as elephants, with white and black hair three spans long on the shoulders, but short everywhere else. The hair is long and fine, and feels like silk; and the creatures themselves, when tamed, are very serviceable. This country produces vast quantities of musk; and the animal, from which it is taken, is about the size of a goat, with coarse hair like a stag, but no horns. It has four teeth, two above and two below, three inches long, and white as ivory, the flesh of the creature being extremely pleasant to eat. All the inhabitants are idolaters, and carry on some trade with the Chinese, but not of an extensive nature. The men are corpulent, with black hair, little noses, and no beards, except a few hairs on their chins; but the women are fair, and well proportioned. This province extends in length twenty-five days journey, or stages; and here we saw most beautiful pheasants, with tails eight or ten spans long. There were likewise several other beautiful birds, but as we could not catch any of them, so we did not inquire what were their names.

The next place we visited, was Egrigaia, so called from a town of the same name, and in it are a vast
number

number of castles, though most of them are fallen to decay. The whole province is subject to the great khan; and the people are idolaters; but notwithstanding many of them are barbarians, yet they make here the most beautiful camblcts in the world, of white wool and camel's hair mixed together; and those who confine themselves to this sort of manufacture, generally live in a comfortable manner.

Throughout all this part of the country, we found that the more the people were attached to idolatry, the more superstitious they became in consulting witches, or persons whom they imagined capable of revealing the knowledge of future events. This sentiment has been always nourished whenever ignorance prevailed: and let not this seem a paradox; for although we often call the Greeks and Romans learned, yet, to use the words of the great Fenelon, in his demonstration of the wisdom of God, "excepting some improvements in letters and luxury, the Greeks and Romans were as barbarous as the savages of North America."

The forcerers in this country have their convents, where they live together like monks; but they are permitted to leave their convents whenever they please. Some of their monasteries are extremely large, being a collection of houses built in the form of a village; and the monks, or by whatever name they are called, are distinguished from the laity, by having their heads shaved. In what they call their worship, they light candles, sing hymns, and observe several kinds of austerities. They eat little besides water and bran, and they wear hempen garments dyed black.

The capital city of Tartary, where the khan resides, is called Kambalu, which signifies The City of the Prince. It is situated on the banks of a river, and was the regal seat of the Tartarian provinces from the most early ages of their government. It consisted formerly of two cities, one on each side of the river; but at present, that to the south is fallen to decay. This new city is exactly square, being twenty four miles in circumference; and the eastern walls are ten paces thick at the bottom of the foundation; but decrease in proportion as they advance in height. It has twelve gates; and the battlements, on the tops of the walls, are so white, that they have a most magnificent appearance at a distance. On the walls are several watch-towers, where soldiers do duty; and within are gardens for the use of the Tartarian nobles. The streets are all built in strait lines, being twelve in number; but the buildings are not magnificent. At the end of each of the streets, a guard of one thousand men is kept; and all the inhabitants are obliged to keep within doors, nor dare they stir out till the great bell has rung in the morning; otherwise the guards seize them, and commit them to prison. At each of the gates there is a large suburb, upwards of three miles in length, where strangers and merchants reside, none of these being permitted to go into the city. The bodies of the natives are burnt; but those of strangers are buried in a field, without the city; from which circumstance we believe that burning is considered as more honourable among them than burying.

Towards the south part of this city, is the khan's palace; a vast building, being several miles in circumference; but hereby we mean only the walls, because the interior part consists of gardens, and many different sorts of buildings; the roofs of all these apartments are extremely high and clumsy, for there are no cielings; but on some parts of the walls are painted several figures, according to the taste of the country. The whole province in which this city and palace are built, is extremely beautiful. The mountains present the traveller with the most agreeable prospects, such as rivers, lakes, and plains, covered with thousands and ten thousands of cattle. Sometimes the eye is directed from the landscapes to the cities, castles, woods, and groves, so that the mind of the traveller is in a manner refreshed, after having passed over sandy deserts, and very dangerous precipices.

Travelling from this part of the country, we came to the river Saugan, one of the longest we had seen. It waters a vast extent of territory, and, after receiving a great number of additional streams, falls into the oriental or eastern ocean: this river is navigable upwards of a hundred miles, and about ten miles from the capital city of the great khan; there is a bridge over it three hundred paces in length, and eight in breadth. It has twenty-four arches, supported by an equal number of pillars, cut out of serpentine stone, and is flat and even at the top. The sides are adorned with pillars about nine feet high, with the figures of wild beasts carved on them. It is amazing to think how fertile the country is near this river, and yet the cultivation of it is much neglected by the inhabitants; which may serve to point out the truth of what was advanced by Pliny; namely, "That one must not look for industry, where heaven has bestowed plenty, but rather where nature has been niggardly in her favours."

From this famous bridge, which perhaps exceeds in magnificence all others in the country; we travelled thirty miles over a plain which had all the appearance of a garden. The ground did not admit of our viewing objects at any considerable distance; but the trees, the shrubs, and aromatic herbs, all conspired to make our journey agreeable. Sometimes we crossed small rivulets, which emptied themselves into lakes; and at other times we were agreeably entertained in seeing the natives hunting tygers and other wild beasts. At the end of this plain, we came to the famous city of Gouzā, pleasantly situated on the banks of a small river, and full of inhabitants. There were then a great number of merchants in the town; for many of the natives are employed in making lawns, muslins, and cambricks. The buildings are not magnificent, nor are there any palaces; for as the people depend mostly on trade, so they are not very fond of those gaudy ornaments so much courted and sought after by the vain, the idle, and the voluptuous.

Adjoining to the city, the road divides itself into two different branches, the one leading northward, and the other to the south. In travelling along the road leading to the north, we passed through a vast number of small towns, in each of which were castles built on eminences, but most of them fallen to decay. The lands however were better cultivated than any we had hitherto seen in Tartary; for here were many vineyards and gardens, which produced the most excellent fruits. But here we were again interrupted by a desert which took up seven days to cross; but at the end of it we came to the city of Pian-fu, where there is a brisk trade for silks. The name of this place shews it to have a near affinity with those used in China; which serve to shew, that although many of the antient Chinese names still remain in that empire, yet some others have been borrowed from Tartary. It is not yet one hundred and twenty years since the Tartars invaded China; and along with them, when they conquered that empire, they took their manners, customs, names, religion, and form of civil government.

Here is a spacious palace, with a magnificent hall, in which their deceased khans have their pictures set up in frames. They have a tradition here, that the castle near the town was built by one of their emperors, called Dor; and, from an affinity in the pronunciation, some have imagined that he was the same as the Persian Darius. In proof of this sentiment, they tell us, that Dor, the prince here mentioned, was of such an effeminate disposition, that he was attended only by young women, some of whom drew his chariot round the city. Probably there might be no difficulty in applying to this prince all that we read in history concerning Darius; but then there are two things to be considered: First, that all ages and nations have produced men of similar dispositions; and Secondly, it does not appear, during the decline of the Persian empire, when the Darius here mentioned reigned, that their dominions extended so far

as Tartary, or at least so far as the places here alluded to. Travelling twenty miles further, we came to the famous river Kara-moran, exceeding broad and deep, and its banks are adorned with many fine cities, where a considerable trade is carried on in ginger, cotton, silk, and several other articles.

Having passed this river, two days journey brought us to the city of Karian-fu, where the inhabitants manufacture cloth of gold. The country round this city is situated rather low, but produces a great variety of different articles, which are purchased annually by the merchants who come from China. Spices, ginger, with a vast variety of other articles, grow here, particularly canes, which are reckoned the best in that part of the world.

The established religion here is idolatry; but there are several Mahometans, and Nestorian Christians. To the westward we travelled over an extensive plain, where we found but few inhabitants, although there were several villages; but most of the men were gone upon some secret expedition, probably to rob and murder their neighbours, a crime they will always be guilty of till they are brought under a regular form of government. We continued our journey five days more over a most delightful country, had it been properly cultivated; but nothing can induce some of these Tartars to apply themselves to that useful art.

This brought us to the city of Quenzan-fu, which has often been the seat of the Tartarian princes; and here we found the son of the grand khan, governor. The city has nothing in it remarkable, being built in the Chinese or Tartarian taste. The houses are few, and the streets not paved. There are several pagan temples in it, but they are poor miserable structures; and the idols worshipped by the inhabitants are the most frightful that the human imagination can form any notion of. From this city we travelled above thirty miles over a country partly plain, but in some places there were rising grounds, from whence we had the most agreeable prospects. Near the middle we came to a plain belonging to a prince, son of the khan, and found the whole structure painted in gold and azure. The country yields plenty of game; and various sorts of silks are manufactured, which they sell to the Chinese merchants. It is in some places amazing to behold the different prospects, such as mountains, vallies, rivers, and lakes; also cattle feeding on the most delightful pastures.

Three days journey from this place, over the most stupendous mountains, we came to the province of Kunkin, which we found to be well inhabited. Some of the natives are husbandmen, but the greatest number are merchants, who dispose of their goods, either to those who come from the Mongul empire, or from China. The greatest disadvantage a traveller meets with in this country, is, that of being constantly in danger from the attacks of wild beasts, such as lions, tygers, leopards, wolves, wild boars, dogs, and roe-bucks. The inhabitants, however, are so dexterous in catching these creatures, that they are not more afraid of them than we are of our domestic animals.

We were full twenty days in travelling over this country, which although in some places mountainous, yet presented us with many agreeable prospects. Turning to one side, we beheld sandy deserts, which having tired the sight, the transition was made in a moment to the most delightful plains, interspersed with rivers, and abounding with cattle. At the extremity of this country, we came to the province of Ak-Baluk-Mungi, that is, The White City of the Borders. The whole of this country is extremely populous, and round it is a plain two days journey in circumference. But to the westward, for twenty days journey together, there are many woods, mountains, and precipices, which diversify the face of the country; but there are so many curious plants growing here, that it makes an ample amends for all the difficulties attending the procuring of them. Vast quantities of ginger, cotton, corn, and rice,

grow here, and some of them without cultivation; for the inhabitants are in a manner strangers to industry.

The people here are wholly idolaters, there being neither Mahometans, nor any Nestorians among them; and here it may be necessary to observe, that when the jesuits mention people under the epithet Nestorian, they always mean those Christians in the east who call themselves Greeks, without submitting themselves to the see of Rome, or by any means whatever acknowledging the papal supremacy.

Having passed through the plain, we came to a province in the borders of Mungi, called Sindin-fu, from a city of the same name. This province is small, being not above sixty miles in circumference, but it is exceedingly fertile, abounding in cattle; and would produce all the necessaries of life, could the people be only stimulated on by a spirit of industry and emulation. It had formerly many powerful kings, but one of them dying, left his dominions among three sons, who divided the kingdom, and each inclosed his own territories within walls.

For some-time they continued to exercise their authority in this manner, each over his own respective subjects, till at last, quarelling among themselves, they became an easy prey to the great khan, who subdued them, and annexed their territories to his own dominions. There are more rivers in this province than in any other we visited in Tartary, some of which are above an hundred paces in breadth, and most of them have stone bridges over them, adorned with rails and marble pillars.

Towards the southern extremity of the province, all these rivers meet together in one stream, and form a very spacious flood, which has more the appearance of a sea than a river. From hence this amazing river continues its course through an extensive country, one hundred days journey in length, till at last it empties itself into the Oriental ocean. All along its banks are vast numbers of castles, inhabited by the governors of provinces, and some of them are granted to the officers who act under them.

Continuing our journey partly along the banks of this river, and partly through a sandy desert, we arrived at the borders of that extensive part of Tartary called Thibert, or Tibet; and here it is necessary to observe, that as the Russians pretend to a right of exercising a sovereign authority over many provinces who were never subject to them, so the great khan of Tartary does the same; for Tibet, properly speaking, is an independent country, and was never yet subject either to the emperor of China or Tartary. On our first entrance into this extensive province, we found many things agreeably suited to please a traveller, particularly vallies, covered with the most delightful verdure; castles, that pointed out the magnificence of the possessors; and ruins, which seemed to indicate, that in former times this place was greater than it is at present. During the whole of our journey through this country, we were every evening alarmed by the cries of wild beasts, but our guides taught us the proper methods to make them keep at a distance.

This method, however useful, was yet plain, easy, and simple. It consisted in setting fire to a few bundles of canes, which grow here in great abundance; and they being large, the cracking occasioned by the fire is heard at a considerable distance. No sooner do the wild beasts hear the cracking of these canes, and see the fire, than they seek shelter in their dens; and travellers, if they are in caravans, pass on in safety, unless their own imprudence induces them to leave their company.

There are many customs in this country, which seem to differ essentially from any we have hitherto mentioned, particularly relating to their marriage ceremonies. When a stranger arrives, the women, who have daughters, bring them to these strangers; and, for a small sum, suffer them to become as it were common prostitutes; and the girl, when she leaves her

her gallant, receives a small present as a certificate that he has lain with her; for those who marry wives, never inquire whether they are virgins or not. The presents the girls receive, consist, for the most part, in ornaments; and the more valuable they are, the higher her merit is estimated. When she marries, she is not indulged with any such privileges, and the men are careful not to give any occasion of jealousy to each other. They are all idolaters; and so ignorant are they with respect to moral obligations, that they think it no crime to rob or steal from their neighbours. They have many superstitious customs among them, such as applying to forcerers for information concerning the knowledge of future events; and here we find that they encourage a vast number of impostors. Thunder, rain, storms, earthquakes, and indeed every occurrence in nature, furnishes them with fresh opportunities of displaying the arts of necromancy, and deceiving those people, who, more ignorant than themselves, are apt to place confidence in their diabolical practices.

Those animals which produce musk, are very numerous in this country; and that article affords them a large source of wealth. Their language differs in many respects from that of the other Tartars; and they use small pieces of coral instead of money. The men are clothed in sheep-skins, with the wool next to their bodies; and the women in hempen robes, dyed yellow, with pieces of coral hanging from their necks. All their idols are dressed in the same manner as the women; from which circumstance, we imagined, that, like many of the Greeks of old, and indeed many of the Romans, they worship female deities.

This country is remarkable for a species of dogs which are as large as our asses in Europe; and they are so expert in catching wild beasts, that nothing more is wanting to stimulate them on, than just to point with your finger. We had an opportunity of seeing many of these wild creatures taken, such as tygers, lions, and wolves, but the wild bulls were the most fierce of any. These creatures are not only furious, but they have such an artful way of defending themselves, that it is extremely difficult for the dogs to catch them.

Leaving the province of Tibet, we travelled westward to Kaindu, a province formerly governed by its own kings, till it was subdued by the great khan of Tartary. It contains many towns and villages; and the capital city gives name to the province. Here is a great lake stored with fish; and corals are in such plenty, that if the people knew in what manner to dispose of them, they would become such a lucrative article of commerce, that they would produce vast riches.

The great khan will not suffer any of his subjects to fish for coral, unless they pay such an exorbitant duty to him as swallows up the whole of the profit. Throughout the whole of this country we met with all those necessaries of life which we could have reasonably expected. Here are no vines, but they make excellent liquor of rice corn, and spices; and cinnamon, ginger and cloves, are in great plenty. The cloves grow on small trees, whose boughs and leaves are much in the same form as our laurels, but somewhat larger, and more straight, with very small white flowers.

The inhabitants of this country are the most gross idolaters that ever we met with in the whole empire of Tartary. Thinking it not sufficient to worship their idols, they actually prostitute their wives and daughters before their altars. This is what was common among the antient Greeks, and very probably among those people of whom we have an explicit account in the scripture history of the Old Testament.

They have two sorts of coin, the first of which consists of small pieces of gold, and the other (strange to relate, but yet true) of pieces of dried salt, with the effigies of the prince stamped upon it. With

these two different pieces of coin, if they can deserve that name, they purchase goods from their neighbours; but in general the state of commerce is such in this country, that an equal exchange of commodity takes place of money; which, indeed, is the practice in all barbarous nations in the universe.

Leaving this part of the country, we travelled fifteen days through the most delightful plains, where we found a great many ruined cities and castles, occasioned undoubtedly by the Tartarian hords making war upon each other. In several parts of this country we met with most delightful rivers, which produced abundance of excellent fish; but so indolent were the inhabitants, that they never gave themselves the least trouble concerning them, being contented with living in the same manner as their ancestors had done many years before.

After riding five days through a populous country, where we saw vast numbers of fine horses, we came to Yachi, the capital of the province, a large city, and rich in trade. Besides the inhabitants, who are chiefly idolaters, there are likewise some Mahometans, and Christians of the Nestorian sect. In their notions of modesty, decency, and respect for the marriage-bed, they are like many more of the Tartarian tribes; for any man may lie with his neighbour's wife, if she chuses to permit him.

They use, for money, small white shells found in the sea, upon which they engrave a mark pointing out its value. But this money cannot be negotiated among any besides themselves; so that when they deal with strangers, they are obliged to exchange one commodity for another. They make vast quantities of salt, there being a spring, or mine of that nature, near the city, the liquor of which, being boiled, the salt settles to the bottom of the pan.

To the westward of this city, we came to the borders of a most beautiful lake, one hundred miles in circumference, which abounds with almost all sorts of fish; but that article of food is not much used in the country.

Turning more to the south-west, we entered the province of Karazan, so called from a city of that name, where the prince, who is subject to the great khan, resides. The country is extremely beautiful, there being vast numbers of fine rivers, in some of which they find gold dust; and on their mountains are mines of gold. Both the dust and the ore they exchange for silver, or goods of any sort that they happen to be in want of. They send vast numbers of horses to the Indies, and they are much esteemed, being patient in bearing fatigue, easily supported with provender, and extremely swift.

In war they use targets and armour made of the hides of buffaloes, with steel lances, and cross-bows. Their arrows are barbed in such a manner, that they cannot be taken out of a wounded person without cutting away a piece of the flesh. Those who are in danger of being taken up for crimes, carry poison along with them, which they swallow, in order to escape torture. In former times, before they were subdued by the khan, they were more barbarous than at present, for they murdered all such strangers as happened to come amongst them; but now things are altered, for their princes, as well as the khan, taste the sweets arising from an intercourse with strangers; since, while it causes riches to flow among them, it likewise helps to refine their manners, and remove many of their antient prejudices.

In this country there are many serpents of a monstrous size, some of them being ten paces long, and as many spans thick; under the breast they have two little feet, like a crocodile, and their eyes are as big as those of a cow. The most probable opinion is, that as crocodiles can live on the land as well as in the water, so the creatures here mentioned are no other. This is the more probable, because the mouths of these serpents are so wide, that they can swallow a man, which is exactly the case with the crocodile. These creatures lie hid in the day, and in the evenings crawl

crawl out for their prey. They are so fierce, that they will tear a lion to pieces; and it is remarkable, that they live mostly by devouring wild beasts. The people take them by placing traps in the sand when they go to drink. The flesh is reckoned delicious, and the gall is considered as an infallible remedy for the bite of a mad dog.

This province is not above three hundred miles in circumference, but extremely populous, there being small villages full of inhabitants in almost every place. They breed vast numbers of cattle, but they take more pleasure in horses than in any other animals. The men are all taught to ride as soon as they can manage a horse; and they are so expert in the managing that creature, that they can, in a few days, train up the most unruly to whatever exercise they chuse.

In travelling westward from this place, we passed a great number of mountains on the north; and at the end of five days journey entered the province of Kardan, the prince of which is subject to the great khan. The name of the chief city is Vocham; and there is great trade carried on in it. They have here several gold mines, but none of silver; and their method of exchange is, to give one ounce of gold for five ounces of silver; from whence it appears, that they are not proper judges of metals.

The men work a circle round their necks, with a needle dipped in ink, to make them appear handsome. They mind little besides hunting, hawking, or riding, leaving all the domestic business to the women. They have slaves, whom they employ in cultivating the ground, and these poor creatures are such as they take prisoners in war. As soon as the women are delivered, they get up and wash themselves and the child, so hardy are they in their constitution; on such occasions the husband receives all the compliments from the visitors, the women being considered as little better than common servants.

The air in this province is very unhealthy, and often proves fatal to strangers. The natives eat raw flesh, and drink a sort of liquor made of rice, which they call wine. They have no images; but they adore the oldest man in the family as the author of their being. This notion prevails in some other parts of Tartary; but notwithstanding this species of idolatry, yet they acknowledge a Supreme Being. They have no written characters; but make their contracts with wooden tallies, each party keeping one half of the tally, and the creditor returns his part when the debt is paid.

They have no physicians; but their magicians, who are a sort of vile impostors, pretend to cure all sorts of disorders by the assistance of the devil. When a man is taken sick, the magician is sent for, who having learned the nature of his disorder, falls a dancing and singing, while a wild sort of musick is playing; he then gives the sick person something which turns his brain, and then they persuade the relations that the devil is entered into him. Here the musick and dancing ends; and the magicians ask the devil, or, in other words, the raving sick person, whether he is to live or die. For the people really believe that the raving of the sick man is the voice of the devil speaking in him.

He is told, that if he will restore the patient to health, he will receive some of his blood as an offering. If the voice answers he is to die, then the magicians tell the relations that the gods will not be appeased, the offences of the sick man have been so great. But when the answer is, that he will recover, and that event takes place, the following strange ceremonies are observed; twelve magicians, with their wives, are sent for, and so many rams, with black heads, are to be sacrificed by them; accordingly the candles are lighted, the house perfumed, and the blood of the rams, with the liquor in which the flesh has been boiled, poured out into the air; the priests and their wives dancing and singing in honour of the devil who has been so propitious to them. They then sit down and eat the flesh of the rams.

The following is the account of the manner in which the khan subdued the provinces of Karazan and Kardan.

In 1272, two Indian Kings, the one from Bengal, and the other from Mein, joined their forces together against the khan, and invaded his territories with an army of sixty thousand horse and foot, and above a thousand elephants with towers on their backs; each carrying ten men. Nertardin, the Tartar general, who had encamped near a great wood, knowing the elephants would not enter it, the king of Mein advanced to attack him; but the Tartarian horses were so frightened at the elephants who were in the front of the army, that they could not be made to advance: hereupon the Tartars alighted, and, tying their horses to the trees; went up and plied the elephants so warmly with their arrows, that they fled to the wood, overturned their castles, and trampled most of the men to death. Then mounting their horses, they fell furiously upon the king of Mein, who, after much slaughter of his men, was put to flight.

The Tartars after the victory returned to the wood, and by the help of their prisoners brought 200 of the elephants; and ever since that time the khan has made use of these creatures in war. It was at this time that the provinces, already mentioned, happened to rebel; but finding the khan so powerful, they thought it most proper to assist him; and though they were obliged to become in some measure tributary, yet they still enjoy most of their antient privileges.

After this engagement, the khan marched his victorious Tartars into the Indies, where he conquered the kingdom of Mein, since called Pegu, and likewise the kingdom of Bengal, and settled princes over them, whose race continued till they were subdued by Tamerlane.

Departing from this place, we travelled three days over an unfrequented desert, where we saw not so much as one single inhabitant. It was wholly on the descent, and terminated in a very extensive and most beautiful plain. The merchants from the south come no further to the northward than this plain; for here the inhabitants of the mountains meet to exchange their goods. Nothing can be more romantic than this part of the world; for the country, from which we descended, seemed to have no height at all, so gentle was the descent; but when we came to view it from the plain, it appeared like a mountain whose top reached up to heaven. On the other hand, although the descent was gentle, yet the plain at a distance, as far as we could behold, appeared in the utmost degree of natural grandeur. Villages, gardens, rivers, brooks, lakes, and meadows, all conspired to enliven the amazing prospect; while the cattle grazing in the pastures, seemed to enjoy the gifts of nature with gratitude. There are no inns here for the merchants or travellers; but that deficiency is easily made up, as they travel in caravans; and they pitch their tents in the evening, where some sleep, while the others in their turn wait, lest they should be molested by wild beasts, or plundered by robbers.

Travelling still more to the southward, during a journey of fifteen days, we passed through a dreadful desert, where we saw not so much as one human being. Every now-and-then we had a wood to cross, the inhabitants of which were elephants, rhinoceroses, tygers, lions, wolves, and many other sorts of wild beasts. At last we arrived at the capital of the kingdom of Mein, which borders on India, where we found that all the inhabitants were idolaters, and spoke a particular language, which had some connection with the Roman. And here it is proper to observe, that the travellers, who visit those parts of Asia, should at least know the Persian language, which in one sense or other is as generally understood there as the French is in Europe.

When the Tartars took possession of this kingdom, they demolished most of the public buildings, but they spared a grand monument which had been erected over the grave of one of the kings of Mein, from a sup-
position

position that he had been one of their own countrymen. It is probable there had been a tradition which taught them to believe this; nor can there be the least doubt but some of the Tartars had formerly invaded this place, seeing they are continually engaged in wars.

This monument consisted of two marble pyramids, each ten fathoms high, one at the head, and the other at the feet of the sepulchre; and at the top of each was a ball, the one being covered with gold, and the other with silver. Around those balls or globes, hang little bells of the same metal, which, when the wind blew, tinkled, and made a most agreeable sound. The whole of the monument was covered in the same manner; so that it afforded a splendid sight to the beholder. This prince was of opinion, that his soul was to sleep with his body, and this accounts for his ordering so much money to be laid out in building him a monument.

Such is the account given of these countries by the Venetian priests, or friars; and when we compare them with those of the jesuits, there will not appear any reason to believe that they told any thing but what is consistent with truth. Travellers have indeed been often reproached with telling falsehoods, and delighting in what is called the marvellous; but those who have visited foreign countries, well know that new things are to be seen every day, which they never saw at home; and therefore when we hear any thing related, we should not be too hasty to find fault, because we are not able to disprove the assertion.

But having, from the writings of other travellers through Tartary, mentioned several particulars relating to their laws, manners, and customs, the magnificence of the great khan, and the power of his subordinate vassals; we shall here take notice of what the Venetians say of such things in general. And this will appear the more necessary, when it is considered that the reader should not only know the situation of the countries of which he has the accounts before him, but likewise all such interior circumstances, and remarkable incidents, as are necessary to improve his mind in knowledge.

“The Tartars (says these friars) are different in their manners; some being extremely courteous to strangers, and others equally barbarous and cruel. The youth treat their parents with the utmost respect; and when any of them prove disobedient, they are punished in the most exemplary manner. But this is only in some of the provinces; for in others, there is but little natural affection shewn. However, it is rather a general rule for those who are young and healthy to take care of the aged and infirm. This sentiment arises from a principle established in the hearts of all human beings, and indeed is one of the strongest bonds of society.

If a young couple enter into a state of courtship, articles of agreement are drawn up by the parents, not in writing, but by figures cut on wood; and if it happens that either of the parties dies before the marriage has taken place, then the contracts are buried in the grave of the deceased, nor can the survivor ever marry afterwards. They believe that all these contracts are ratified in heaven, which sentiment is general among them, and also among the inhabitants of some other heathen nations.

In the arrangement of their military forces, they are very regular, and their conduct in this particular; has some affinity to that of the ancient Romans. Their troops are divided into tens, hundreds, thousands, and ten thousands, each division under a proper officer; and, besides these, they have always strolling parties of irregulars, to give notice of the approach of the enemy. Each man has along with him eighteen horses and mares, because they live upon the flesh of horses, and these cattle carry their tents, it being a rule with them always to encamp when they are afraid of being overtaken with rain, or any sort of inclemency of the weather; for though they are enured to all sorts of hardships, yet they are not

so ignorant as to neglect self-preservation. Their diet is either the flesh of horses, or the milk of mares done up into curds, which they use instead of bread; for when once the milk has been curdled, they dry it in the sun. Each man carries ten pounds of this in his wallet, and every morning puts half a pound of it mixed with water into a small leather bottle, which the jumbling caused by riding prepares for his dinner, and this he eats as delicious fare along with horse's flesh.

When they attack an army, they do not approach the enemy in a regular manner as is done by the Europeans, but they move in strolling parties from one place to another, and take aim in such an exact manner that their shots generally do execution. When they find the enemy's troops broken, they reunite their own, and pursue the runaways, whom they destroy without mercy. It is almost impossible to conquer them; for although they are sometimes put to flight, yet the enemy cannot make any advantage of the victory, the horses of the Tartars being so swift, that they cannot easily be overtaken, and next day they are able to renew the engagement with redoubled fury.

Their military discipline is strict; for although many of their hords live by plundering their neighbours, yet they are severely punished when they steal from each other. Every petty theft is punished with one hundred strokes given by a person appointed for that purpose; and the instrument of punishment is a short thick cudgel; but if the goods stolen are of considerable value, such as a horse, or the like, then the criminal is cut asunder in the middle with a sword, unless he can restore nine-fold to the party injured. They mark their cattle with a brand, and then send them to graze without a keeper. Prisoners are kept in a state of slavery three years, and then they are branded on the cheek, and told, that if they should be ever found in arms again, they will be put to death.

With regard to religion, they acknowledge one Supreme Deity; and in all their bed-chambers they have a tablet fixed up with characters engraven on it, the sense of which is, “This is the High God of Heaven.” Before this tablet they burn incense every day, and, lifting up their hands, strike their teeth together three times, praying for knowledge and health. But besides the Supreme Being, who is adored by all ranks among them, they worship another subordinate being, whom they call Natigay, and who they believe presides over all the affairs of this lower world. They suppose that he also governs towns, castles, and cities, and they invoke his assistance when they go on journies. They leave their families to his care; and before they eat, they grease the mouths of their images with the fat of the meat. When they boil meat, they pour the broth before this image, of which every family has one; and these we may call their domestic gods.

They believe the soul to be immortal; but that when a man dies, it enters into another body, either better or worse, according as it has acted in this world. Thus a poor man, if he has been virtuous, his soul enters into the body of a rich one; and so on, in progression, till being perfectly purified, they are taken up to God in heaven. On the contrary, if he has been wicked, his soul will go into a body of a lower nature, and descend gradually from one period of existence to another, till it terminates in the meanest reptile.

Beyond the country of the Tartars, is the Region of Darkness, so called because it reaches to the north pole, and there the sun does not shew his beams more than six months in the year. Thus it may be said, that in twelve months they have but one day, and one night. When they expect the rising of the sun, after six months darkness, they dress themselves in their best apparel, and go to the tops of the frozen mountain, and the first person who makes the discovery is considered as highly favoured of heaven. The inhabitants of those inhospitable deserts are short in stature, but very robust. They have no form of government, and live rather like brutes than human creatures.

creatures. As they are not sensible of their wants, so their desires being few, are as easily gratified.

The Tartars who live more to the south, often venture over the snow in winter, and rob those miserable creatures of what they have reserved for subsistence during the winter. But this species of robbery often costs the southern Tartars very dear; these people who live in such inhospitable deserts having so much knowledge arising from a principle of self-preservation, that they are frequently upon their guard; and if they are so fortunate as to surround their enemies, they cut them all to pieces. Barren however as this place is, yet it produces such things as are necessary for the subsistence of the inhabitants; and sometimes they come more to the southward, and sell their furs, which are reckoned the best in the world.

“ While we were in Tartary, (say these Venetian missionaries) we took an opportunity of mentioning something to the khan concerning the Christian religion. To this the khan answered with some warmth, and asked us, How he could become a Christian? You see (said he) the Christians who reside in my dominions are so ignorant, that they neither know nor can do any thing; but our priests can perform whatever they please, they can cause cups to come to them, and send them to me at my table. Nay, they can make our images speak; whereas your crucifixes, as you call them, are dumb, and of no manner of service either to the dead or the living. He added, that if he turned Christian, it would not be in his power to assign a reason for it to his people; for his own priests were endued with such a sovereign power, that they could at any time whatever deprive him of his life. But he concluded by telling them, that if the pope would send an hundred ambassadors to him, so learned as to be able to convince him that his priests did work all their miracles by the power of the devil, then he would consent to be baptized, and oblige all his subjects to become Christians.

The Tartars observe a vast number of festivals in honour of the Supreme Being, to whom they give different names, and ascribe different qualities; but all these are of so gross a nature, that they only serve to point out that the people are idolaters. There are some Jews among them, and probably these were the descendants of those who did not chuse to return from the Babylonish captivity. The great khan has as many wives as he chuses; and polygamy, which never, as far as we know, was acknowledged in Europe, seems to have been an invariable custom in the eastern nations, from the most early ages of the world after the general deluge.

The daughters of the khan are in general married to the governors of provinces, but the sons are appointed to act as commanders in the army. The succession to the sovereignty goes by appointment of the emperor, and therefore the most favourite wife bids fair to have her son declared khan. This practice is consistent with all the accounts that we

have of the eastern nations; it is so in China, in Turkey, in Persia, and was so among the Jews of old. It is of service in preventing disputes; for as the will of the khan is considered as a supreme law, so those that reject or dispute it, are considered as rebels:

From what has been here said on the best authorities concerning the Tartars, we are naturally led to draw the following reflections; and we would chuse to deliver our sentiments in such a modest manner, as not to give offence, either by contradicting the general testimonies of travellers, or establishing our own opinion at the expence of truth.

And first, here is a vast tract of land on our terrestrial globe, which is either little known, or little visited by Europeans, who profess that they are every day practising new schemes to make discoveries in strange countries hitherto unknown.

And to what is it owing, that while we are making such laudable enquiries, we neglect things of so much importance? The reason is obvious; we spend much time in seeking out islands in the southern hemisphere, merely to gratify our curiosity, while we neglect to cultivate an acquaintance with people from whom, in the way of commerce, we might receive many advantages. Some of the Tartarian provinces are not so far distant from our East India settlements, but we might soon cultivate an acquaintance with the inhabitants, and, by doing so, improve their minds in the love of arts and sciences.

Secondly, As these people are in a manner continually engaged in wars amongst themselves, or employed in robbing their neighbours; so we, by cultivating an acquaintance with them, might teach them the arts of peace, and make them friends to human society. This would be accomplishing, as far as lies in our power, the plan of Divine Providence; which, from the creation of the world, was, to make men live in harmony with each other, by abolishing those prejudices which have hitherto made a distinction.

Lastly, The cultivating an acquaintance with these people, joined to a laudable attempt to civilize their manners, would lay the foundation for a lasting peace among Christian princes. This, however, can only be done in consequence of men's wishing to do to others as they would desire to be done by. Long have the European princes attempted to extend their conquests over heathen nations; but in consequence of their avarice, which led them to neglect making proper improvements, some of them have lost all their settlements, and others hold what still remains by a very precarious tenure.

How noble the thought, how exalted the consideration, to reflect, that while we have extended our commerce to distant nations, and even subdued many of the inhabitants, we make those people like ourselves! But in vain do we wish for these things taking place, till our principles are regulated by virtue in the first instance, and all our actions flow from virtuous principles. But, leaving these events for more happy times, we shall now proceed to describe other nations, not yet mentioned in this work.

TRAVELS INTO DIFFERENT PARTS OF THE EAST INDIES,
INCLUDING A DESCRIPTION OF ALL THE ORIENTAL ISLANDS,
Extracted from Loubine, Hamilton, the Jesuits, and the Dutch Journals, &c. &c.

IT was a just observation of the philosopher Epicurus, that nothing in this world can satisfy the desires, nor gratify the ambition of man. He looks for something beyond what he daily beholds; and his ambition requiring nourishment, he goes on gradually

through difficulties unthought of before, to acquire a knowledge of those countries, whereof he has had but an imperfect account in history; he returns home with an account of the discoveries he has made, and claims a superiority in the scale of human beings, from

a persuasion that he is justly intitled to it, for having seen and known more than they who lived before him. This will in some cases apply to those who have undertaken voyages through seas unknown to the ancients; but with much greater propriety to travellers, who, in a manner regardless of their own personal safety, explore the most unfrequented deserts, and acquire the knowledge of written laws, strange customs, and still more strange forms of government.

It was this sentiment which first induced our European adventurers to penetrate into the inmost parts of Asia; and, rising superior to every degree of opposition in their way, they trampled over dangers and difficulties, and settled a complete system of geography; so that we who live in the present age, receive the benefits arising from their unwearied industry. It is true, that circumstances have often obliged very laborious and ingenious travellers to desist in the very midst of their journies; but what was left unfinished by one, has been completed by another. Thus many of the Europeans, who had traversed the whole empire of China, could not, with safety, penetrate into the kingdom, or rather the empire of Japan. The reason is obvious: some of the jesuits who had visited China, expected to meet with a favourable reception from the inhabitants of all the heathen nations in the east, but they found themselves mistaken; for the people, so far from complying with the proposals made them by these superstitious fathers of the church of Rome, banished them out of their country, declaring at the same time, that no Christian should ever be again admitted there, unless they consented to trample on the cross. Motives of conscience prevented many of the Europeans from complying with what appeared to them little better than blasphemy; but they were not all of the same opinion.

The Dutch, a body of people the best in the world acquainted with commerce, and the least addicted to the observance of religious duties, where their own interest is concerned, paid so little regard to these scruples, that in order to procure the benefit of commerce, they consented to trample on the cross without any ceremony; which is the more remarkable, because they are Protestants and Presbyterians. As the Dutch therefore are the only Europeans who are permitted to visit Japan, it is from their accounts of that extensive country that we must extract our materials, and we doubt not but they will be found both instructing and entertaining; for the Dutch are in general very accurate writers.

The kingdom, or, as it is commonly called, the empire of Japan, is composed of several islands, which lie about three hundred miles to the eastward of China. Japan, the largest of these islands, which gives name to the whole empire, is about six hundred miles in length, and in breadth between one hundred and fifty, containing no less than fifty-five provinces; and the chief towns are Meaco, Saivai, and Sedo. Saycock, or Bongo, is the next esteemed in extent belonging to this empire, and is about four hundred miles in circumference. The name of the capital city is Bongo; and on the west of this city is another small island called Kisma, where the Dutch have their factory. There is a bridge between the two islands, but the Dutch are not permitted to pass over it without a license from the governor. The next island in magnitude is Tonfa, situated at a small distance from the other, and is about three hundred miles in circumference; and besides these, there are several other islands, all subject to the emperor of Japan; but they are so insignificant, as not to merit a particular description.

From the situation of these islands, we would naturally imagine that the air should be moderately warm; but to the north of the mountains, which run through the middle of Japan, their winters are very severe, and they have great quantities of snow. The air is reckoned healthful; and neither plague, gout, nor stone, have ever been heard of amongst

them; but the small-pox and fluxes are very frequent. Some have been of opinion, that these islands were first peopled from China; and this will at first appear reasonable, when we consider the near affinity the one has to the other. There are however some objections to this opinion, which we shall state in the words of those who have visited the place, and then deliver our own opinion.

The natives of Japan burn their dead; in China they are buried. The Japanese shave their heads, which they have continued to do from time immemorial; whereas the Chinese never did so till within these few years. But however plausible comparisons between the manners and customs of people may appear to an ordinary reader, yet this is certain, that from the similarity of rites and ceremonies in heathen nations we must not be too hasty in drawing conclusions. There is not, perhaps, a nation in the universe where a similarity in some things cannot be found; for as men were originally the same, so they have all the same passions, although often devoted to different ends. It is therefore much more probable that Japan, with all its subordinate islands, received its first inhabitants from Tartary, a country we have already described; and, allowing the hypothesis which we have already laid down to admit of no dispute, then there will be an end of the controversy.

The Japanese are indeed singular from all other nations in some respects; for when they mourn for the deceased, they dress themselves in white, and sing the most cheerful songs, as if they were pleased with the removal of the deceased. They are in their natural tempers serious to strangers, which is in many respects consistent with the character we have given of the Tartars; and, when all circumstances are considered, it will appear evident, almost to a demonstration, that the Tartars in the eastern part of their extensive empire first established colonies in these islands.

The Dutch historiographers have given us an account of the different cities in the empire of Japan; and the most considerable, according to them, is that of Meaco, antiently the seat of empire; and is the place where the high priest of their religion still keeps his residence. This pontiff, or high priest, is much respected; and though he has no right to exercise a temporal authority over the subjects, yet in all things of a spiritual nature he is considered as sovereign and supreme.

This city is very extensive, being about twelve miles in circumference, and contains, on a moderate computation, upwards of one hundred thousand inhabitants; but then it must be considered, that many of these are women and children. It is beautifully situated on a river, which divides it into equal parts; and the buildings have something in their exterior appearance far surpassing those in China. The streets are not paved, but they are every day watered; so that the people are not incommoded by the dust; and they have many temples consecrated for the service of their idols, which at a distance make a most agreeable and delightful appearance.

Travelling more to the eastward, we came (say the Dutch journalists) to the city of Samair, which is both large and populous, situated on a part of the island adjoining to the sea, and much frequented by merchants from the eastern parts of Asia. The buildings are convenient; the sea washes one part of the city, and that towards the land is defended by a strong wall, with a ditch, which renders it in a manner impregnable. There are several temples in it, all built in a pyramidal form, which running up like so many spires, are seen at a considerable distance. Like all the other cities in this empire, the streets are not paved; but as there are men appointed to sweep them every morning, consequently no inconveniences happen. Most of their houses are built in such a manner as to have but one floor, like our cottages in England; but behind them they have delightful gardens, and apartments for their wives. The shops are as public

and other IMAGES, at the beginning of the Year,
in Nagasaki the Imperial City of Japan.*

public as in any parts of Europe, but no women are to be seen in them; for as in China, so in Japan, the men transact all the business, leaving the women to conduct their domestic affairs, and to bring up their children according to the custom of the country.

At a considerable distance from the city of Savai, we came to Jedo, situate on an arm of the sea; and here the emperor at present resides. This city is built in the rural fashion, having broad open streets, and gardens behind most of the houses. The shops, fronting the streets, make a most magnificent appearance; for their goods and different articles of merchandise being hung out for sale, they attract the notice of passengers, and generally procure them a vast number of customers. The buildings have something of a decent plainness in their appearance; for though they are only one story high, yet they are constructed in a much more regular manner than any thing of the same nature that we meet with in Europe. Here, as in other cities in Japan and China, no women are to be seen in the shops; for so jealous are these people, and such are their wretched notions, that they think a woman cannot be modest, unless she is kept under an uncommon restraint, and prevented from keeping company with any of the other sex besides her husband, who frequently acts the part of an arbitrary tyrant.

The palace is large, being no less than five miles in circumference, and stands in the middle of the city, but it is surrounded by a number of gardens. It is inclosed by three walls; and within them are canals and fine walks, where the women regale themselves when the season will permit. Within the innermost wall are the royal apartments, where the emperor lives with his women, and these are what the people in the east call their seraglios. The furniture of the women's apartments are extremely grand, the carvings are consistent with the taste of the people; and they are gilded over in such a curious manner, as to strike the eyes of the beholder. This description, however, is only what occurred to us in looking at the exterior parts, for we were not permitted to go into the inside of that part of the palace where the women reside.

Between the first and second wall, are the palaces where the princes of the blood have their residence. The petty princes, who are subject to the emperor, have their apartments next to those of the princes of the blood, and they are obliged to reside there six months in the year. If they go away without leave from the emperor, they are to be punished as rebels; this being considered as the highest act of disobedience.

It is certain, that there is much gold in this country; but it is equally certain, that the people know not in what manner to make a proper use of it. Thus they were forward enough to tell us, that the ceilings of their houses were covered with gold, whereas, upon a narrow inspection, we found that what gave them such a luminous appearance, was no more than tiles baked in the sun, and sprinkled over with gold dust.

Without the palace, were the houses of the great officers of state, who are chosen from among the chief of the nobility; and they make such a magnificent appearance in their dress and equipage, that a stranger scarce knows how to distinguish between them and the emperor. This, however, is in some measure necessary; for the more sumptuous they appear, the greater is the respect shewn to them by their sovereign, who seldom looks any farther than the gaudy trappings of honours. Nay, it may be added, that this is the only way to procure the favour of the prince; for without that, he would pay but little regard to them, and they would be considered rather as slaves, than as persons entitled to the respect of a sovereign prince.

Some of the buildings are of brick, but for the most part they are of wood, so that when a fire takes place, a general conflagration ensues. Their apartments however are very commodious, and the partitions of their rooms are made to fold up like a screen,

so that they can lay several rooms into one, as they have occasion. The houses of the nobility are wainscotted with cedar, the floors covered with fine mats, their ceilings are painted and gilded, and the doors finely varnished. The tradesmen, and those of an inferior rank, content themselves with a thatched roof and clay walls; but they have always a secret apartment where they conceal their most valuable effects. They have no glass, nor does it appear that they know the art of making it; and as for their windows, they have only wooden shutters. They use neither chairs, tables, or beds, but sit on mats; and these serve them as beds at night. Their rooms are hung either with pictures, or painted paper; and the rest of their furniture consists in screens, China ware, and swords, which they hang up in their room. They have watchmen to attend their houses during the night, so that few accidents happen to them.

The Japanese are so different from the Chinese in their natural dispositions; that they seem never to have been at one time the same people. In general, the Chinese, especially those who live in the southern provinces; are very courteous to travellers, and ready to supply all their wants according to their ability. On the other hand, the Japanese are cruel, ambitious, and uncharitable; and have so little compassion for the poor, the sick, or the lame, that they frequently let them perish, without offering to give them any assistance. It is not however to be supposed that this character is general, but rather peculiar to the inhabitants of some of their remote islands; for however savage the manners of some men may appear to strangers, yet even among themselves there is but little reason to believe they have not the same passions with other human beings. This will appear to be the case with the Japanese, when we consider that the Dutch are the only people who at present trade with them; yet as these Hollanders are kept under the severest restrictions; so having a natural antipathy to the people, they frequently let resentment get the better of their judgment.

In their habits they are very remarkable, carrying along with them as it were badges, or marks of antiquity. They wear several vests one upon another; with a coarse gown over all, not much unlike some of the eastern Tartars; and they have drawers also, which come down to the middle of their legs. Their shoes, which are made in the form of slippers, are without heels; and though their heads are shaved; yet they wear no caps. They have fans and umbrellas to defend them from the weather; and they wear a large heavy broad sword on their right side; with a short dagger fixed to their sash or girdle. They eat very little beef or mutton; nor the flesh of any tame animals in general, but subsist chiefly on what they catch in hunting.

As many of them differ in their religious sentiments, so some are prohibited from eating the flesh of any animals whatever, nor will they so much as taste milk, butter, or cheese, but live upon rice and herbs; as is common in some other parts of the East Indies. In their common drink they use tea; but others make use of a liquor distilled from rice in the same manner as the Chinese. In eating their victuals, they use two little round sticks, in the same manner as the Chinese; for they are strangers to the use of knives, forks, spoons, or table-cloths.

They have a strong propensity to plays, balls, masquerades, and such theatrical diversions as are consistent with the taste of the country. The subject matter of their plays consists of some particular incidents in the history of their country; and their ministers of state, and great men, are generally the principal actors. Great encouragement is given by the emperor to shooting-matches, and such other manly exercises, which prevents the young men from sinking into a state of effeminacy. This is the more necessary, because they are frequently engaged in wars; for were it neglected, they would never be able to oppose their enemies. On such occasions, the emperor

peror and his great officers of state are present to give encouragement to the young men; by rewarding them according to their merit.

There is a grand festival celebrated every year, when they go in procession to visit the tombs of their ancestors. At these solemnities every house is illuminated, and they march out of their towns at midnight in solemn procession to the graves of their departed relations, where they eat, drink, and make merry for several days and nights successively. At the conclusion of the feast, they march round the town with flags, streamers, and banners, beating upon brass pans before the temples of their idols, and at the doors of the princes of the blood, and those of the great officers of state.

Their instrumental musick is not harmonious, but some of the singers have exceeding good voices; and at the end of every play there is always an entertainment for the actors, provided at the joint expence of the company. There is one custom wherein they differ from most other people in the universe, and that is, they keep their festivals for the most part in the nights; whilst others, consistent with the order of nature, use that period of time for sleep. For this practice they were formerly much ridiculed by Europeans; but what would one of these Japanese say, were he to come to England, and find that our nobility and gentry seldom begin their entertainments till the honest industrious working man, the most useful member of the community, is going to sleep?

Another circumstance in their manners is, that instead of bowing to their superiors, they stand stiff up before them. However, this is only an exterior ceremony; for whenever they go into a court of justice, they kneel down before the magistrates. Nay, they always pull off their shoes when they go into their temples; consistent with the antient custom, as related in the Old Testament, where we read that Moses was commanded to take off his shoes, because the place on which he stood was holy ground; and we find that this custom is still peculiar to most of the eastern nations.

There is one circumstance in the ferocity of their manners, which some may doubt the truth of; but when we consider that it has been often related by the chaplains of the Dutch factory, from time to time, and all these gentlemen agreeing in the leading principles, we have but little reason to doubt their veracity. To this we may add, that every thing mentioned by them, has been confirmed by letters transmitted to the council of state at the Hague, and entered on their public journals; that which we allude to is the following.

When a great man makes a public feast or entertainment, he calls his servants together, and asks them, which of them will, for his sake, kill themselves before the guests. None of them are compelled to comply with his request; but he who is led to do so from motives of superstition, has some honour conferred upon his family. Complying with the barbarous request, the servant takes a knife and rips up his own bowels, which by the spectators is considered as a real act of heroism. It is certain, however, that this practice is not so common as some have represented it to be; for, according to the latter accounts, it seldom takes place but on very solemn occasions.

They have many good regulations concerning their highways; for at the end of every nine miles, posts are fixed up, mentioning the distances from the place where they set out; and also from the town whither they intend to go. But they have no public houses nor inns for the entertainment of travellers; and what is a most insupportable nuisance is, that when they execute malefactors, they crucify them with their heads downwards, and leave the bodies hanging in that manner along the sides of the road. This creates a most intolerable stench, which, often proves fatal to travellers; for the roads are laid out in such a

manner, that they cannot turn to the one side or the other. As for trade, they have none at present but with the Chinese, the Dutch, and the inhabitants of Jessō. Formerly the Portuguese ingrossed the whole trade to themselves; but in 1622 they were accused of having formed a conspiracy against the government, and all the Christians in the empire were put to death. At the same time a law was made, prohibiting any christians from ever coming to trade there again; and thus the Portuguese, by the meddling intrigues of their jesuits, lost the benefits of a commerce that might have been of great service to them, even in the present age.

We have already taken notice, that the Dutch, to their everlasting dishonour, consented to tread upon the cross, of which we shall relate the particulars more at large.

The Dutch, having learned in what manner the Portuguese had lost the commerce of this extensive empire, resolved to profit by their weakness, and improve their fortunes on the imprudence of the jesuits. This, however, could not be done without practising such gross hypocrisy as is dishonourable even to mention; but the love of truth imposes the melancholy task. The Dutch having fitted out a considerable fleet, sailed for Japan; and arriving thither, sent messengers on shore, who were conducted to the emperor, and declared to him, that they were not christians. As a proof of their sincerity, they told him, that they were ready at any time to trample upon the cross. As neither the emperor nor his council had an opportunity of making proper enquiries concerning the truth of what was advanced by them; so their simple assertion was taken as the declaration of men who spoke the dictates of their consciences; and ever since they have been permitted to have a factory there; although for their mean compliance, and abominable hypocrisy, they are despised by all the European nations. But notwithstanding all these privileges, if they deserve such an honourable name; yet the Japanese are so jealous of the Dutch, that when any of their ships arrive, a magistrate goes on board, and takes an account of the number of their men. He likewise conveys on shore their sails, rigging, and guns, which they keep till such time as they are ready to proceed on their voyage home to Europe. From this circumstance it will appear, that the Dutch are ready even to sacrifice their lives for the benefits arising from commerce; for when deprived of their sails and rigging, at such a vast distance from shore, the Japanese could soon murder them, nor could the Dutch ships afford them any refuge. Their factory, which stands on the point of a rock, and is separated from the city by a river and a wall, has no communication with the inhabitants during nine months in the year. Thevenot, who visited Japan, and whose testimony concerning that part of the world, and the manners of the people, has never yet been called in question, writes of them in the following manner; but more particularly of the island of Disnia, which is the place near where the Dutch have their factory, and where they are treated with every mark of indignity.

This Island (says he) is not above two miles in circumference, and no Dutchman can stir out of it, or come into the town of Nanguasque, to which the island is joined by a bridge, without hazarding his being cut in pieces by the guards who are appointed to watch their motions; nor are the Dutch so much as suffered to have a lighted candle in their houses during the night. If the centinels hear a noise, they blow a horn, and the governor immediately sends a party to inquire the reason; and if it happens that any quarrels have arisen among the Dutchmen, they are punished in the most exemplary manner. In this slavish condition the Dutch belonging to their factory in this empire, remains upwards of eight months in the year; and they are such slaves to avarice, that, forgetting every thing that constitutes the

the characters of men, they sink down into the most abject state of servility.

At the season when the Dutch fleet is expected, the governor of Nanguasaque places centinels on the hills, to give notice of the approach of any ships; and when they appear, a boat is dispatched with an officer on board, who sends an express to the emperor; and the Dutch then must move no further till an express returns.

In the mean time a particular account is taken of the cargo of every ship; with the name, age, and stature of every man on board, and an interpreter translates it into the Japanese language. When the express returns, the ship's crew are permitted to come on shore, and all mustered before a Japanese commissary; and every person is called upon by name, to give an account of his age, quality, and office, to see if it agrees with the particulars first transmitted to the emperor. After this, they are again sent on board, and the hatches sealed by a Japanese officer; nor can they be opened without permission from the governor, who always sends a person to see what is taken out, and who seals up the hatches again. Nor dare the Dutch sailors light a candle on board, nor make any noise; which if done, they are severely punished. The crew of the ships are not permitted to have any conversation, nor any communication with each other; nor is any officer permitted to go on shore, except the person appointed to carry the present to the emperor. The emperor having accepted of the present, and made up another for the company, the Dutch officer is conducted under a strong guard to Nanguasaque, in the same manner he was brought from it, which generally takes up above two months. The Dutch officer, who on this occasion attends the emperor, falls down on his knees before him, after having trampled on the cross, and declared he is not a Christian; and they observe the same ceremony when they approach any of the great officers of state.

While the Dutch ships remain in the harbour, none of the natives of Japan are permitted to go on board to trade with the sailors; and those who carry provisions are not suffered to take any money for them, till the permission to trade comes from the emperor, and then they deliver in their accounts, and are paid. After this, six persons from every ship are permitted to come on shore, and trade for themselves, and to remain on shore four days; but they are obliged to take up their lodgings in the suburbs. When these six men return on board, six more from each ship are permitted to succeed them, and traffick in the same manner. As for the merchandize belonging to the company, the Dutch make a particular invoice of them, with their prices: which, being translated into the Japanese language, is affixed to the gate of the town, next to the factory, so that every person may know what to purchase; and this table or bill is kept fixed up six weeks together, in order that there may be a free trade.

The goods are generally paid for in silver by weight; for they have no coin, besides some small pieces of copper. After six weeks free trade, there is no further communication allowed between the Japanese and the Dutch; nor is there much necessity for it, as that is succeeded by the season when the Dutchmen are obliged to begin their voyage to Europe. As the Japanese know that the Dutchmen bring no women along with them, so they endeavour to avail themselves of that circumstance, which is not at all difficult, seeing they have always a great number of slaves. These they let out for a certain price to the Dutch seamen, which iniquitous branch of commerce brings them in many considerable advantages.

With respect to the goods which the Dutch carry to Japan, they consist of almost all the common manufactures in Europe; such as hardware, toys, woollen cloth, linens, dressed leather, gloves, beads, watches, sail-cloths, and a multitude of other articles. In re-

turn, the Dutch receive silver by weight, fine copper, cabinets made according to the fashion of the country, with a variety of other things; which, when brought to Holland, turn out to great advantage. The Dutch carry over to Japan fire-arms, in the same manner as was formerly done by the Portuguese, which is perhaps one of the most impolitic species of trade that was ever yet undertaken by the Europeans.

Many of the European merchants have wondered why the Dutch would undergo all these indignities for the benefit of that kind of commerce which they considered as not worthy of being sought for at the expence of so much blood, and the continual endangering the lives of men who have no farther objects in view than that of procuring a subsistence. To this it is answered, that this trade is far more advantageous to the Dutch than some of their European neighbours are apt to imagine; for the Dutch having monopolized a vast number of different articles of commerce to themselves, they triumph over the scrupulousness of the inhabitants of those nations who do not choose to stoop to the same abject methods as are practised by themselves. One great, and indeed an essential article of their commerce with the inhabitants of Japan is, the spice trade; which they have in a manner wholly ingrossed to themselves. And here it is surprising to consider that the English suffer such an infringement on their trade, as that of waiting tamely at the pleasure of the Dutch, who, without right to enjoy, or power to secure conquests, triumph over our weakness, and acquire immense fortunes at the expence of honour and conscience, and to the prejudice of Great Britain, the queen of nations, and empress of the seas.

Had we an equal share of the spice trade with the Dutch, it would be attended with the most beneficial consequences; for it is well known that these articles of commerce are more frequently asked for in Asia than in Europe. At the Cape of Good Hope, the Dutch purchase goods from all the fleets that come from other nations in Europe; and with these they trade to Japan, where they receive a most valuable consideration in return. Bullion itself is not in its own nature considered as an article of commerce so valuable as the spices, which they have robbed us of; and of these precious commodities they destroy vast quantities every year, in order to enhance the price; so that in this respect they may be considered as the common enemies of mankind.

God has bountifully furnished the world with spices, as well as with all other sorts of commerce, in order to make his creatures as happy as is consistent with the state of affairs in this world; but those monopolisers would deprive mankind of the benefit, and defeat the designs of creation and Providence. Two thirds of the world never taste those delightful fruits; for our Dutch neighbours, rather than suffer our people to reap the advantages of this branch of commerce, join avarice to meanness, and destroy in the bud what they have not an opportunity of disposing of in foreign countries.

Nay, it may be justly added, that could they engross into their hands all the wine, corn, and oil in the world, as well as the aromatic spices, they would certainly do it, and leave their fellow-creatures to starve. This is the distinguishing characteristic of a democratical form of government, which enriches a few, and keeps the generality of the people in a state of slavery. It is however happy for the world, that this sentiment takes place only among the inhabitants of one particular country. We consider their conduct as even beneath contempt; and we look upon their avarice as a disgrace to human nature. Had their ambition to acquire a name been equal to their avarice to procure fortunes, and entail riches upon their families, we should have seen the face of human affairs totally changed; and men, despicable in their first appearance, might, like the Romans of old, give laws to the universe. But private interest took place of glory, and

all that is considered as good and noble on the theatre of this lower world sunk as it were into oblivion, while riches were sought after without a taste to enjoy them, and honours never could obtain, where they could not gracefully fit.

Having said thus much concerning the conduct of the Dutch, with which we cannot imagine any reasonable man will be offended, we shall proceed to a farther investigation of the manners of the people in Japan, and then describe more at large the face of the country. This will be found the more necessary, when it is considered that descriptions of different places, various countries, and dissimilarity of manners, make up one general landscape; and, at the end of our narrative, we behold, in epitome, what was before laid out in detached pieces.

The Japanese have almost all sorts of cattle and poultry that are found in Europe, but their horses are very small. Rice is the principal grain the country affords, which always grows in water till it is ripe. They have also some very good wheat, but not in such quantities as rice, though much esteemed, and of great service to the inhabitants. Their husbandmen are slaves; for they have no other wages than what are allowed them by their masters; and when power takes place of law, protections are generally trifling and insignificant. This is not much to be wondered at, when we consider the manners of the people, who, from the early ages of the world, have still retained this barbarous custom.

The Japanese have a much better taste in laying out their gardens than is common with the natives of China; for before their houses is a large plot of ground laid out in walks, mounts, and terraces, adorned with greens and flowers, which are seen from the streets, there being always a large vista from the outward gate, through the house to the garden. With respect to the form of the country, it varies according to the situation of the different provinces, some of which are low, but in general they are mountainous. In particular there is a prodigious high mountain, which equals that of Teneriffe; for although it stands near sixty miles within land from the shore, yet the mariners can see it above one hundred miles before they approach the shore. There are likewise a vast number of volcanos, or burning mountains, and they are more dreadful during the time that eruptions take place, than either Vesuvius or Ætna.

It is well known that the Japanese are very ingenious in making up their fine lacker and varnish, of which we shall give the following account from Tavernier, the Dutch missionary, and several other writers, particularly from some papers published in the Philosophical Transactions.

“The varnish used by the Japanese is made of Turpentine, and a curious sort of oil which they mix together, and boil into a convenient consistence, which never cause any swellings in the faces or hands of those who are employed in working it.

The swellings that often happen to those that work the lackered ware, and sometimes to those that pass by the shops, arises from the lack, and not the varnish; for the lack is composed of the juice of a tree, and is of the colour of cream. The surface, when exposed to the sun, immediately turns black, after which it is stirred together, till it is reduced to a proper consistence, so as to be proper for use. It is then put into a barrel, and stirred twenty-four hours together with a piece of iron, till it becomes quite black; they then mix with it a quantity of the ashes of burnt boughs, and afterwards lay the whole composition on the thing they design to lack.

This part of the process being over, they lay the lackered goods to dry in the sun; and when it is hard, they rub it with a smooth stone and water till it is as plain as glass. In the same manner all other colours are laid on, except gold, which is done in the following ingenious manner.

The varnish is prepared as has been already mentioned, and that being laid upon the thing to be

painted, it is let stand till it dries, and then they lay over it gold or silver leaf, or, in more inferior things, the dust of pins.

It is certain that the Japanese are very ingenious in these matters; but the people of Europe have now in some measure rendered all their ingenuity unnecessary, for the improvements that have been made from time to time among us, have taught the world that we can improve upon any plan whatever.

With respect to learning, they have very contracted notions, for the whole of their knowledge consists in reading, writing, and repeating the traditions concerning their country, which have been handed down by their ancestors. It is certain, however, that they are good mechanics; for those articles which are bought by the Dutch, and imported into Europe, shew that they are far from being destitute of real genius. They are so ingenious in the art of making warlike instruments, that one of their broad swords will cut any common piece of iron quite through.

In writing, they use the same characters as the Chinese; they write in the same manner from the top to the bottom; but still the two languages are very different; nor is it an easy matter to ascertain wherein the difference consists. They have no cyphers whereby they can cast up accounts; but they use a little board with parallel lines; and a bead, which they move from one line to the other. All their degrees of nobility are conferred by the high priest, which seems to be the only mark of distinction which they now enjoy. The act of conferring titles of honour was in former times confined to the priesthood, but in latter ages it was claimed by princes, whose province it now is. The reason is obvious; for in antient times the priests had great power, but the regal dignity prevailing over superstition, the kings of the world have supported their right, and established their grandeur.

In this country there are many medicinal springs, and the people know how to make proper use of them to the best advantage, in the cure of many distempers, to which they are frequently subject. With respect to physical knowledge, they are extremely ignorant, so far as relates to the theory; nor is it much better with them in the practice of surgery. They know not the art of letting blood when a patient is afflicted; for whenever a person complains that he is sick, they give him cold water to drink, nor do they deny him any thing he has a mind to partake of.

It is certain that the use of gunpowder and fire-arms was not known among them till they became acquainted with the Portuguese, and after them with the Dutch; and yet for all that, the Japanese pretend that they knew that art long before they were visited by the Europeans. This will appear the less probable, when we consider that even to this day they are but little acquainted with the use of fire-arms; and as for military exercise, they are totally ignorant of it. The whole history of their country rests on tradition; and as to astronomy, they know nothing at all of it, contenting themselves with believing the lies told by their astrologers who, under pretence of being able to reveal the knowledge of future events from observing the motions of heavenly bodies, keep them in a continual state of ignorance.

All the islands which compose the empire of Japan, are, in the first place, under an aristocratical form of government, being subject to their own princes, who have a sort of sovereign power in their own dominions. But all these princes are subject to the emperor, who can depose them when he pleases, and at the same time seize upon all their territories, as well as their personal estates. In former times, the emperor of Japan was high priest of the country; but a revolution having taken place, and a new race of sovereigns ascended the throne, the regal and pontifical dignities were separated; and at present the high priest, being the descendant of the antient royal family, exercises the pontifical office, leaving the emperor to discharge every duty of a civil nature. To this it may

RUSTICS of JAPAN.

may be added, that the emperor, by the constitutional laws of the country, is obliged to marry one of the daughters of the high priest; but this practice is rather of a religious than a civil nature.

The emperor commits the administration of public affairs to four of his principal ministers; but he has no favourite or prime governor whatever. His privy council consists of twenty-eight members, of which four are petty kings, whom he considers as his vassals. These vassals are obliged to attend at court six months in the year, and each of them has a house adjoining to the imperial palace.

The eldest sons of the nobility are also kept at court till they are provided with employments, and for the farther security of the government, oaths of allegiance are administered every year; and so jealous is the prince of his subjects, that he has spies at all times throughout every part of the country. But this is not all; for the emperor being no stranger to the restless disposition of his subjects, employs all those who have not a way of getting a subsistence, to mend the highways, and erect public buildings. This is undoubtedly a very prudent measure, and were it to be imitated by our European princes, we should not see so many public executions of criminals.

When the emperor of Japan goes abroad, he is generally attended by five or six thousand of his guards; and his standing army amounts to one hundred thousand foot, and twenty thousand horse. And yet this seems to be a species of madness, or rather it is consistent with that effeminacy of manners so peculiar to the eastern nations. For why should a sovereign, whose dominions are circumscribed by the sea, keep up a standing army, when he considers the internal defence of his empire, and the security of his subjects, depend upon a naval force well regulated, and conducted by officers who have the honour of their prince, and the happiness of their fellow subjects, more in view than any pecuniary emoluments?

That the revenues of this emperor are great, was never yet disputed; but yet we have some reason to believe that our Dutch missionaries, either from misinformation, or perhaps from worse motives, have exaggerated them to an intolerable height, especially while they tell us, that the annual sum exceeds all the revenues of the European princes put together. Probably the revenues for the support of the emperor's court may amount to one million sterling; and this is an amazing sum, when compared with the state, dignity, and revenues of many of our European sovereigns, who look upon themselves as superior to all others.

The aristocratical power prevails so much in this country, that not only the petty kings, but every lord of a district, and even the father of a family, have the power of life and death; and they condemn their dependents, without being called to any account by the sovereign. The laws are not written, and therefore every one is left to explain them in what manner he pleases, so that the forms of political justice must be very imperfect. And here we observe, with a great man now alive, that when the administering of justice depends on the capricious passions of men, then there is an end of civil government, or rather civil government has not had a beginning. The greatest curse that can befall a community, is that of having justice administered in a partial manner; for in vain are judges sincere or upright, if the channels of justice are corrupted.

The petty kings and princes are seldom put to death, notwithstanding their offences may be of the most atrocious nature. In all such cases they are banished to some desert islands, where they are condemned to servile employments, either during their natural lives, or for a certain number of years. The punishments of the ordinary sort of people depend, on the will of the judges by whom they are condemned. In some cases they are burnt alive; but thieves in general are crucified with their heads downwards.

In more atrocious crimes, they are torn in pieces by wild horses, and sometimes they are boiled to death in oil; and if a prisoner is proscribed, and refuses to deliver himself up to public justice, any person who meets him, may kill him.

If a soldier is convicted of a crime committed by him against the martial law, he is first tried, and, if found guilty, permitted to take his own life away; for it is considered as dishonourable among the Japanese for a soldier to be put to death by the hands of the common executioner. This sentiment is of great antiquity, for nothing was more common among the Romans, than to furnish the condemned soldier with instruments in order to put a period to his own existence. The sentiment itself is however barbarous, for the greatest instance of cowardice consists in a man's depriving himself of that life which is not in his power to restore.

The Japanese are all idolaters, and more so in their forms of worship than the Chinese. Besides all the visible heavenly bodies, they worship idols of a monstrous appearance, calculated, one would imagine, for no other purpose besides that of striking a terror into the minds of the beholders. In their sentiments concerning the leading principles of religion, they are far from being uniform. In general, they believe in the immortality of the soul; but at the same time they admit of transmigration, much in the same manner as the northern Chinese and eastern Tartars. They have two idols whom they consider as superior to all the others, namely, Xaca and Amida, whom they generally apply to under any sorts of affliction. They give no account of the creation of the world, though they do not own it to be eternal. They have many convents, and the recluses live in them unmarried, submitting, according to their orders and rules, to several austerities.

Their priests are so strict, that when it is discovered that a penitent has not confessed all his sins, he is pushed headlong from a rock, and dashed in pieces. This barbarous custom has obtained such respect in Japan, that all ranks of people are obliged to submit to it. It is probably owing to such things that the inhabitants are so barbarous to strangers; for can those men shew pity or compassion to those they are unacquainted with, while they have none for relations and friends?

The city of Meaco is a stately temple built of free stone; and Captain Saris tells us, that the body of it is as large as one of our cathedrals. It is supported by strong pillars, and on the altar is the image of an idol in copper gilt, which reaches as high as the roof. According to Sir Thomas Herbert, the chair in which this idol sits, is seventy feet high and eighty broad; his head is big enough to contain fifteen men, and his thumb is forty inches round; so that we may be able to form some notion of its magnitude. The temple stands on an eminence, and on each side of the ascent are fifty stone pillars, and on the top of every pillar a lantern, which makes a great shew at night. There are no less than sixty other temples near this city, and in them are upwards of three thousand idols.

Adjoining to the road between Jeddo and Surungo, stands the idol Dabis, made of copper, and in the form of a man, sitting on his legs, and extending his arms, being about twenty feet high. Like most other Pagan priests, those of Japan are not behind any in the world, in playing their tricks upon the credulous. Thus we find, that in the city Tencheda, there is a temple, where, on the first day of the new moon, they present a young virgin on the altar to the idol. The whole temple is for some time illuminated, after which the lights are in a moment put out, and then a human being, doubtless one of the priests, comes and lies with the young woman. She is made, however, to believe, that it is the god, who, from motives of love for her, takes upon him a human form, in order to enjoy her. This abominable custom can be compared to nothing we read of in history, except the feasts in the Grecian temples, particularly in Lacedæmon,

cedæmon, where such things were practised more publicly than in Japan. Indeed the account of this circumstance is confirmed by all those writers who have given us any history of Japan, but particularly our learned countryman; Sir Thomas Herbert: he tells us; That the young woman is highly honoured ever after this, and, at her coming out of the temple, is entertained with music. The priests are not only respected by the people in general, but even by the emperor himself, who sits uncovered when any of them are present. The Portuguese jesuits, who have written of Japan, give a very black and odious character of their priests; but this will not appear very surprising to those who are acquainted with the tenets and spirit of the Church of Rome.

The truth is, the Portuguese had converted some of the Japanese to popery, and they taught them that the church was not only independent of the state, but even superior to it. This so much alarmed the emperor, that he imagined they were going to establish a new sovereignty above the civil power. These Christian converts were then extremely numerous; and finding that they were devoted to destruction, took up arms in their own defence, and cut to pieces a party of the emperor's forces. Upon that, the emperor marched against them, and the Christians were totally routed. Above sixty thousand of them were either killed in battle, or put to the torture; and when a Christian priest was taken in a house, all those in that house were put to death along with him; and such as were suspected of favouring Christianity, were obliged to sign a writing, declaring, that they hated and abhorred Christianity, as subversive of the civil government. Thus above sixty thousand persons were cruelly put to death, merely because the priests made them believe the church was independent of the state.

In their marriage ceremonies the Japanese are very different from the Chinese, agreeing only in this, that all persons joined together in wedlock must attend the priest in the temple before the image of the idol. The bridegroom and bride have each a lighted torch in their hands, while the bonze or priest reads the marriage contract; after which, all persons, who are present, wish them happiness, at the same time giving presents to the bride, who throws all her toys and childish playthings into the fire. Then they sacrifice an ox to the idol of the temple, each person present being obliged to eat a part of it, and the rest is distributed among the priests, except a small part, which is burnt.

From the temple they return home in triumph, and on these occasions the rejoicing lasts several days. The men are permitted to have as many concubines as they can support, and they have an absolute power over their women, being at liberty to turn them away, or put them to death when they please; but they receive no marriage portions with them. The woman found guilty of adultery is punished with death; but to prevent all temptations to the committing of that crime, open houses are permitted for lewd women, under particular restrictions. In the marriage state, they have some practices which are very barbarous. Thus, they reckon it no crime to procure abortion, and those who have several children whom they cannot support, are permitted to destroy the females; but all the males are taken care of at the expence of government, and bred up either as soldiers, or to some other employments, necessary for the support of the state. Every morning they wash their young children in cold water; and the priests are obliged to instruct them in learning, at the expence of the emperor.

As the great number of provinces in Japan, and the islands which compose the empire, are situated distant from each other, so they have often very different manners and customs. Some however, are general, particularly such as relate to their funerals. In that they have retained something which is similar to the practices of those who reside both within and without the Ganges in the East Indies. On the day

appointed for the funeral, a large square pile of wood is erected without the town; and the friends and relations of the deceased being assembled, the women first move forward, cloathed in white, which is the colour of mourning here, as well as in China. The women of quality are carried in litters of cedar, and after them follow the men richly dressed, according to the fashion of the country; the bonzes, or priests, follow after, dressed in their robes, and one of them carries in his hand a lighted torch, singing with his brethren as he goes along. Some carry brass basons, which they beat upon like drums, and others baskets of flowers, which they strew upon the ground, thereby pointing out that the soul is gone to paradise, or at least to a more happy state than it was in before. Several banners, with the names of their idols, and lanterns full of lights, are carried before the corpse, which is placed upright upon a sort of couch, cloathed in white, and his hands joined together in a praying posture. The children of the deceased follow after, the oldest of whom carries a lighted torch in his hand. Having walked three times in procession round the funeral pile, near which are placed tables, with all sorts of provisions, the chief bonze begins a hymn; and having waved a lighted torch three times round his head, tells the spectators that the soul never had a beginning, nor will it ever have an end. He then flings the torch away, which the children of the deceased take up, and kindle the funeral pile, throwing on oil and several sweet spices, till the body is consumed to ashes. After this, the children offer incense, and adore their father as being in a state of happiness. The next day they return to the place, and put up the ashes and bones into a gilded urn, which is hung up in the house for some time, and afterwards interred with much solemnity. And every seventh day, seventh month, and seventh year, the children offer incense, and pay their devotions to their deceased parents.

Throughout the whole empire of Japan, the people are much addicted to the mercantile arts; and though they carry on some trade with other nations, as we have already taken notice of, yet they chiefly subsist by one island trading with another. The reader will be better able to form some notion of the climate, when we inform him, that the empire extends from the thirtieth to the thirty-eighth degree of north latitude, and in some places to the fortieth. It is about one hundred and fifty degrees east of London; but, so far as we can learn, it was not known to the antients on account of their ignorance of navigation.

To the northward of Japan we came to the land of Jesso, or, as the people call it, Yedso; which extends from the fortieth degree of north latitude, into inhospitable desarts; and, in the opinion of some, reaches as far as the continent of America. It does not join to any of the Japanese dominions, but is separated from them by an arm of the sea several miles in breadth. The inhabitants of this country are perhaps as barbarous as any in the world, and it is extremely dangerous for strangers to be among them. They are so wild, that they scarcely deserve the name of human beings. They suffer their beards to grow, and cloath themselves with the skins of wild beasts, and are very much dreaded by the Japanese. They have their women in common, as was the custom with the antient Britons; and they are great lovers of wine. They are all idolaters, and adore the heavenly bodies, but have no regular form of worship.

This is the account we have of these people, from our most early travellers, and no doubt but it is true; but then it must be remembered, that they are now greatly civilized in comparison of what they were in antient times, which can only be ascribed to the influence which commerce always had, and always will have on the manners of a people emerging from a state of barbarity to politeness.

Captain Saris says, "The people of Jesso are fair, well proportioned, and very civil to strangers. Those in the southern parts are well acquainted with commerce, and they export to Japan and China all such

A JAPANESE TEMPLE,

in which the PRIEST *is performing their* NUPTIAL CEREMONIES.

such articles as are produced in their own country. The name of their capital city is Matzimy; and as there is not a regal form of government in the country, the emperor of Japan keeps a garrison here; but for all that the people never acknowledge themselves subject to him. It is true, they pay him a small tribute for the support of the garrison; but this so far from being owned by them as a sign of subjection or vassalage, that it is really considered by them as a privilege; for the soldiers in the garrison are of service to them in suppressing tumults, and preserving the peace.

The whole face of the country appears like one continued chain of mountains, running from the sea of Japan to the northern ocean. It is, however, far from being barren; for the vallies between the mountains produce all the necessaries of life; and there is a vast number of mines of silver and copper. The rain descending from the mountains brings down considerable quantities of gold dust, and with the above different articles their trade is extensive. Their buildings are very much like those of the Tartars, being only miserable huts; and they are so scattered from each other, that they resemble the description given us of antient nations. This however is not to be wondered at, because people, who live as it were in a state of nature, have but faint notions of human society; and without towns and cities, where people can assemble together, all the bonds of society will continue as it were in a relaxed state, and barbarisms will reign predominant in opposition to all attempts towards promoting refinements.

As several attempts have been made to discover whether America and Asia are joined together by land, or only separated by a small arm of the sea; we shall present the reader with an account of all that has been said on that problematical part of history. There are some fragments in antient writers, where, in giving an account of the western parts of Africa, they tell us, that there was a vast island far beyond the Atlantic ocean; but they do not call it by any name. They add further, that some mariners having sailed to the western coast of Africa, were driven towards this great western island, where they settled. Some of the moderns, particularly the late ingenious Dr. Smollet, have adopted this sentiment; and although to one who considers history and geography in a superficial manner, the notions may appear plausible; yet sound reason will point out strong objections against it, which we shall consider in the order they lie before us.

And first, supposing some persons had been driven from Africa to America, by stress of weather; how could they have propagated their species in that part of the world, unless they had women among them? or how could there have been cattle in that country, when it was first discovered by Columbus, unless the vessels in which these strangers sailed bore some resemblance to Noah's ark, containing all sorts of living creatures?

To this it is answered with modesty, that the Africans, as well as all other people in antient times, seldom undertook small or short voyages to sea, without taking their wives and children along with them. As for cattle, they were equally necessary, because the people generally went from one place to another in search of new habitations, and therefore it was absolutely proper that they should take along with them such things as they wanted. It might therefore happen that these adventurers did really embark from the western part of Africa, in order to settle more to the southward, and took along with them every thing necessary for their subsistence. They might, consistent with the moral government of this world, be driven to the westward as far as America; and thus every thing might have been propagated in the ordinary way of generation and cultivation.

Secondly, it has been objected, if the antients knew that some Africans had been driven on the coast of Asia, there must have been a communication between them. Now this is not so much as intimated:

and to add to the force of the objection, let us only consider ourselves situated in an island surrounded by the sea; let us suppose ourselves utterly unacquainted with navigation, or the existence of any other place in the whole universe besides our own island; and let us see a few families embark in a vessel, of whom we hear no further accounts; will it not naturally follow, that they have perished at sea? But it is added, that accounts were transmitted of them, that they landed in a great island far to the westward, and yet we are not told by whom these accounts were brought; nor does it appear, that for upwards of sixteen hundred years the Africans had any connection with their countrymen in America, if ever they had any at all.

To this we shall answer in the same manner as we have to the former objection; not by proposing any scheme of absolute certainty, but rather by resting the whole upon such probable conjectures as are consistent with the nature of history, and indeed one of the most invariable rules by which it must always be understood and conducted.

It is much to be lamented, that all the antients are extremely deficient in chronology, which throws such a cloud of darkness over history, that we are obliged to follow the line of conjecture without positive evidence. Thus we are not fully justified by any accounts transmitted to us, whether there might not have been antiently a connection between Africa and America. Our antient histories are filled with the accounts of battles, sieges, and conquests, but they give us few anecdotes concerning the arts of peace. The Roman armies never penetrated to the extremity of Africa; and how do we know but that, while those ambitious conquerors were endeavouring to enslave one part of the habitable world, the inhabitants of some other parts might be carrying on commerce, and even sending colonies from the mother country, to some more remote parts of the universe? I say, how do we know? for there are several learned men in the present age, who have brought things to light that never appeared worthy of notice to our ancestors.

Upon the decline of the Roman empire, an universal darkness overspread the world, learning was dispersed, and the monuments of antiquity were destroyed. Thus we may conclude, that many records are now lost, which, had they been preserved, would remove all the objections which are generally brought against the peopling of America from Africa. Similarity of manners has been much insisted on; but, as we have before observed, they are not always to be trusted to. However, there is here one circumstance of similarity between the Africans and the Americans, which ought not to be passed over in silence.

So far as we know, there is not now in the whole universe a body of people who practise the barbarous custom of scalping, except the Americans. Now, supposing we should take the liberty to trace effects from causes, we shall find that the objection here started is not so strong as some may be apt to imagine. The antient people, called Philistines in the Old Testament, practised the barbarous custom of scalping their prisoners; and all those who know any thing of history, know that these Philistines in after times laid the foundation of the famous republic of Tyre; and though the inhabitants of Tyre were often engaged in commerce, yet they made it a rule to scalp their prisoners; which is often alluded to, both in the Old Testament, and in Herodotus.

Carthage was peopled from Tyre, and it is well known that the Carthaginians extended the bounds of their empire as far as the western parts of Africa. They still retain the same barbarous custom; which circumstance alone, were there no other to be offered against the objection, would, to a reasonable thinking man, have some appearance of truth. But all that is here advanced is in modesty, and without the least pretension to dogmatical assertions.

To obviate all these difficulties, some have held that Asia and America are contiguous, and that there is a passage from the one to the other by land, though

we have not yet been able to discover it. Nay, it is added further, that though Asia and America may now be divided by seas, yet they were formerly joined together, as England (say they) and the continent of Europe was of old. Earthquakes might have caused the separation, as has happened in other parts of the world; for, from the situation of Jessô, it is very natural to suppose that it was joined to the continent of America. It is true, that none of our modern adventurers have been able to discover this conjunction, though they have made many attempts towards doing it; and, in opposition to the existence of such a conjunction, the following objection has been started.

If there was really a communication between Asia and America, by this country of Jessô, or any other land, then we should have found the same beasts, fowls, and other living creatures in both; whereas it appears that there are many animals in Asia, which were never yet heard of or known in America. Nay, it is added, that there are animals in America which could not live in Jessô, and consequently could never have been brought from that part of Asia.

To this it is answered, that the objection itself is so weak, that it scarcely deserves a serious refutation. Modern navigators have taught us, and even to a visible demonstration, that those who live in the coldest climates are likewise able to live in the warmest. Thus we find that many men have left Norway, the highlands of Scotland, and other sterile climes, and lived many years on the scorching coasts of Africa, as well as in the West India islands. And if the constitutions of men can submit to these changes, why not beasts? In removing from one country to another, Providence seems to conduct human affairs; and thus, though one out of an hundred may expire from the change of climate, yet for the most part ninety-nine live, to shew that God is the sovereign lord of the universe.

Again, it has been objected, that if all the parts of the habitable world had a communication with each other, how did it happen that there was not a black man in America when it was first discovered? This objection is founded upon a supposition that America was peopled either from Asia or Africa. If from Asia, it must have been from Jessô, of which we are now treating. Now the argument itself carries no strength along with it; for the inhabitants of Jessô are not black, but of a yellow copper colour, resembling the people in the northern parts of America. On the other hand, supposing the people of America to have descended originally from the Africans, who are confessedly black, it will not follow that they should be so always. I had once an opportunity of conversing with the late learned Mr. Ellis, of Gray's Inn, on this subject, and he told me that he had attended to the theory as well as practical part of the subject. He said, that men born in warm climates gradually change their colour, when they went to settle in colder ones; and therefore there was no impossibility in real blacks from Africa becoming like Europeans, after having settled many years, and propagated their species in a country in all respects different from their own.

From all that has been here advanced, it will appear evident, that our modern adventurers, in making discoveries, have fallen very short of the object aimed at. A reason however may be assigned for this, but even to mention it is disgraceful to those European princes and powers presiding over mercantile communities. No adequate reward has ever yet been offered to those brave men who are willing to undergo any fatigues, in order to make new discoveries. The dangers are in a manner inexpressible, but fortitude and resolution would enable men to encounter with them, could the parsimony of princes be so far conquered as to offer them a suitable reward. But when men are employed in undertaking such dangerous enterprises for no more wages than what a common seaman receives in conducting a vessel from one port

to another; then all attempts to succeed will prove languid; and the end aimed at will be frustrated.

We have a notable instance of this, in the scheme proposed some years ago by the Honourable Mr. Barrington; a gentleman whose name will ever be revered by all those who have the least regard to knowledge, virtue, and piety, whether considered as existing in theory, or reduced to practice.

That honourable and learned gentleman proposed sending a vessel to make discoveries towards the North Pole, and the consequence was; it miscarried. It is not sufficient to say, or even to alledge, that he was wrong in his conjectures; for had a suitable gratuity been offered to the adventurers as an encouragement for repaying them for the dangers they were to run, probably we should not now have been left so ignorant of that part of the world, as we are at present.

To the north of Jessô, stands Nova Zembla, in the centre of the northern ocean, and near to the Streights of Spitsbergen, and yet the Russians have never been able to make any discoveries of importance in that quarter of the globe. About forty years ago some Russian ships were sent to make new discoveries; and they sailed so far, that they imagined they were arrived near to the coast of California. Flattered with the hopes of success, they sent some men on shore; but scarce had they landed, when the savages took hold of them, and burnt them to ashes. We have been the more explicit on this head, because it will throw a light not only on many things which have been formerly advanced in the course of this work, but likewise on some important passages which are to follow.

It is almost impossible for those who reside in this country of liberty, to form an adequate notion of what travellers suffer who visit foreign countries. And yet it frequently happens that circumstances are aggravated in the representation. The truth is, mankind are not so degenerate as they are represented by some, nor so virtuous as we find them described by others. Thus, in some of our accounts of China, we read, that the people are little better than barbarians; and yet when Father Averil, as we have mentioned before, travelled through that country, he was treated with humanity, though he could not speak one word of their language. It is much the same in other countries, particularly in the eastern parts of the world, where many of our travellers have passed on unmolested; for, as the poet says,

Presence of mind, and courage in distress,
Are more than armies to procure success.

These observations may be with the most becoming propriety applied to Tonquin, the kingdom we are now about to describe, and of which we have procured a much better account than otherwise we could have expected. Our travellers have told us much concerning it, but some fresh matter is added by a learned German, who visited most parts of it a few years ago.

Tonquin is situated nearer China than the empire of Japan, being about four hundred miles in length, and in some places not two hundred in breadth. It is divided into eight provinces, which we shall describe in the same manner as they lie in order; but first we must take notice of the bay of Tonquin, by which the Europeans approach this kingdom. This famous bay is near one hundred miles broad in some parts, and forty-six fathoms water, with exceeding good anchorage. Two great rivers empty themselves into this bay, but at the mouth of these rivers there are several dangerous shoals.

By the River Domea, the European ships having left the bay, enter the first harbour in the kingdom of Tonquin, and at the mouth of it is a bar, two miles in breadth, having sands on each side. When the ships come here, they are obliged to wait for a pilot to conduct them in, and those pilots are so well acquainted with the coast, that they never stir out, except

except when they imagine the weather to be favourable. The mark of this river is a prodigious high mountain called the Elephant, which must be brought to bear north-west and by north; and here it was that we landed, and proceeded to visit the provinces.

Tanam, the province we first visited; is one of the smallest in the kingdom, but produces vast quantities of rice; but cattle are not numerous. The whole of this province is very populous, and throughout every part of it we met with small villages, but seldom saw any of the women. More to the eastward is a province distinguished by the name of Eastward. This province is low, there being no mountains in it; but is so fertile in producing all the necessaries of life, that the people export large quantities every year, without ever knowing any thing of those hardships which arise from dearth or scarcity. Most of the inhabitants are fishermen, and there is a governor who resides in Hean, the chief town of the province. In this town there is but one temple, built in the form of a pyramid, much in the same manner as in China. The houses are low, most of them having only a ground-floor; and the streets not being paved, are for the most part covered with dust or with mud. The fourth province is an island, and has nothing remarkable in it, only that it is dangerous for any except pilots, and it frequently happens that even these pilots are mistaken, which proves fatal to the passengers.

Tenebea lies more to the southward, and is very similar to the last mentioned town, only the harbours are more safe and commodious. There are vast quantities of rice continually growing; but the chief part of their trade consists in exporting their fish, for on all their sea coasts we met with few other persons besides fishermen.

On the east of this province we came to Negeam, which is one of the largest in the kingdom; and here a body of troops is continually quartered. These troops have no fire-arms, which is the rather remarkable, because the jesuits were once in this kingdom, and it is well known that wherever they went, they taught the people the art of making gunpowder. Had the jesuits been hanged before they taught the Chinese to make gunpowder, it might have been of great service to the mercantile world; but these holy fathers were willing to sacrifice honour, conscience, and interest, for the sake of propagating their religion.

West province lies to the west of Negeam, and is very well cultivated, abounding in all the necessaries of life. The whole face of the country is flat, so that no prospects present themselves to the eyes of a traveller; but there are many fine woods, which would be very agreeable to strangers, as well as the natives, were it not for the vast numbers of tygers with which they are constantly infested. These tygers, although of the species of cats, are yet as large in this part of the world as many of our Newfoundland dogs. December 25, 1756, a young gentleman belonging to the East India company's factory, happening to be near this place, his imprudent curiosity led him into one of these woods, where he had not walked more than a few minutes, when one of these fierce creatures tore him in pieces, and eat the greatest part of the body.

More to the north is another large extensive province, diversified with rivers, plains, and mountains. Here are many beautiful prospects; but there are no towns of any note, most of the people living together in small villages. There are vast numbers of wild elephants in this province, who, contrary to the accounts we have of the docility of these animals, are very untractable, and even furious, when approached by travellers; and yet the inhabitants have learnt the art of killing them, which is chiefly for the sake of their teeth, which we call ivory; for it does not appear that any use is made of their skins. They graze in common pastures like our horses; but although very mischievous, yet they are not so large as some that are met with in Africa.

The last province is that of Cachao, which is the

centre of the kingdom, and has a great variety of mountains, rivers, and lakes, and well cultivated grounds, which gives the face of the country a most beautiful appearance.

This province is the great emporium of commerce; and here the Chinese and Siamese merchants come annually to dispose of their goods, and purchase others in their room. Hean, the chief town, consists of at least two thousand houses, inhabited chiefly by poor people; and by the soldiers who compose the garrison; but the town has neither walls nor gates to defend it. For many years the inhabitants of this country lived on good terms with the Chinese; but the latter having ill treated them in some bargains, they are now kept under very severe restrictions. They are almost in the same condition as the Dutch are in at Japan; so that nothing but avarice can induce them to submit to such indignities.

The whole kingdom of Tonquin is for the most part healthy; but the seasons are not distinguished by the rains of summer and winter, as among us in Europe; for instead of that they call them the Wet and Dry season. The Chinese, however, from wet to dry is not accurate, for they come on gradually, which contributes much towards promoting fertility in the country, and in making every thing agreeable to the inhabitants. The wet season begins here about the end of April or beginning of May, and ends in August; and towards the latter end of this season the rain is so violent, that sometimes the whole country is overflowed. Towards the latter end of August the weather becomes more moderate, and in September and October it is quite pleasant and agreeable, nor do any showers fall from that time till the April following, when the rainy season returns.

The capital city of Cochon stands upon the west side of the river Domea, but has neither walls nor gates to defend it. It consists of about twenty thousand houses, low built, with mud walls and thatched roofs, there being very few of them built with bricks or covered with tiles. The principal streets are wide; but as they are not paved, in wet weather they are dirty; and in the dry seasons the passengers are almost choked with dust. The town however is not without its conveniences, for every house has a small yard behind it, in which is a brick building in the form of an oven, where they deposit their goods when they are in danger of being burnt out by fires breaking out in the place. Every person is obliged to keep some buckets filled with water at the top of his house; and if he neglects this, he is severely punished.

Here are three palaces in this city, but that which chiefly deserves our notice, is the king's. It is about six miles in circumference, and consists of a vast number of apartments, in some of which the women are lodged, and in others the ministers of state. The wall surrounding this palace is fifteen feet high, and as many in breadth, and secured on both sides with bricks. Within are many beautiful groves and pleasure-grounds, with canals laid out in the same manner as in China. The other palaces have nothing in them worth notice, for they are inhabited by the general of the army, and the master of the horse, and near the latter are the stables for the reception of the elephants.

Near the harbour is the English factory, and at a small distance that belonging to the Dutch, who carry on a considerable trade here. Throughout the whole country are vast numbers of villages; but they are so small, that some of them contain no more than twenty houses. However, as they are generally built within a few miles of each other, so they form, as it were, one continued rural city. This was the way of living in antient times, particularly in Britain and in Germany; and it may serve to point out that mankind are not so numerous as they were formerly.

In the dry season, the moats which surround the villages serve to fill the canals with water, which separate their grounds; and every house standing as it were in the middle of a garden, thus surrounded
by

by trees and water, renders them extremely pleasant. In the hilly country they have no moats nor banks thrown up against their houses, which is the reason that the people are more healthy than in the lower parts. The partitions in their houses are made of split cane, and their rooms have no other light than what is conveyed to them through a little square hole. Their furniture consists of a few tables, cabinets and stools, and beds in the innermost rooms which travellers are not permitted to visit. In every house there is an altar; for they have their domestic gods as in China and Japan. They are very obliging to strangers, and no person need be under any apprehension of danger in travelling through their country; for they are equally as polite and humane in their behaviour as the Chinese.

In some of the useful arts these people are very ingenious; patient in servitude, and submissive to all those upon whom they have any dependence. They are, however, much addicted to gaming, and have in their conduct an attachment to some practices which are altogether immoral. They are of a tawny complexion, but not so dark as some of their Indian neighbours. Their stature is that of the middle size, clean limbed, and they have long black hair, which grows very thick. Their faces are flat, of an oval form, and when are about thirteen years of age, they dye their teeth of a dark or black colour. This operation takes up about three days, and during the whole of that time they do not take any sort of nourishment, because it is supposed in eating they will suck in some of the noxious japan.

Their outward habit is a long gown, incircled with a sash; and there is but little distinction of dress between the sexes. The people who live in the highest sphere in life, wear silk, or English broad cloth; but all the inferior people, as well as the soldiers, are dressed in cotton, dyed of a dark colour. The poor people generally go bareheaded, except in rainy or stormy weather; when they wear broad hats made of reeds, and covered with palm leaves. They lie on benches covered with mats, and raised about a foot from the ground; and these couches are to be found in all the rooms where they make either private or public entertainments to strangers. On these couches the visitors repose themselves under alcoves, sitting upon one cushion, with another at their feet.

In their way of living they much resemble the Chinese; for, besides boiled rice, they eat small bits of pork spitted together and roasted. They also eat the flesh of fowls, buffaloes, bullocks, goats, horses, dogs and cats, with that of several other sorts of animals. They sometimes mince their pork into small pieces, and make it up in balls like sausages, and eat it without any other sort of dressing. Their bullocks they singe, like bacon hogs; and having steeped slices of raw beef in vinegar three or four hours together, eat it as a most delicious morsel.

The flesh of horses is esteemed equally as good as that of bullocks, and the poor people will eat the flesh of elephants who die a natural death; which may serve to shew that they are a very barbarous sort of people. Frogs likewise make one of their most delicious dishes, and they have great plenty of all sorts of sea-fish. Their shrimps and other small fishes they throw into a jar of salted water, made very weak, which having been stopped for a few days, is reduced to a mash or pap, and this is called balbachauri. Afterwards they draw off the liquor from it, which they call neukumum, and both the natives and strangers use it as a most delicious dish.

The lower sorts of people live as it were in a real state of poverty, but this rather consists in their want of cloathing, than in any deficiency of those provisions which are necessary for the support of the human frame. The people of quality are seldom without fish, flesh, or fowl; and indeed all other articles of luxury are in great plenty. They have a way of keeping their eggs several years together, by inclosing them in a paste made of salt brine and ashes, and kept

in an earthen pot that is stopped close. These eggs they eat along with their rice when they are at tea, and one of these eggs taken at a time with about two ounces of rice supports them a whole day.

Their usual liquor is tea, which is commonly sold by women in the market. They have also a liquor well known to Europeans by the name of arrack, which the natives often drink with their tea, but sometimes by itself. This liquor is considered by the Europeans as very unwholesome, but the people who are natives of the country boil snakes in it, which, according to their notions, remove all the noxious qualities. Thus refined, they look upon it as an antidote against poison, and think they shew the greatest respect to their friends when they treat them with some of this liquor.

They have two public feasts, which they observe annually, and the chief of these is at the beginning of the new year, which is always at the appearance of the new moon after the beginning of January, when they rejoice for ten or twelve days together. During this solemnity there is a total suspension from all sorts of business, and the people put on their best cloaths, and spend their time in drunkenness and all kinds of diversions. On such occasions, the common people get so exceedingly drunk, that they frequently quarrel with each other, and sometimes murder is committed.

The other great festival is when they get in their harvest, and then they perform their devotions with a more than ordinary zeal. At these times they also bring victuals and drink to the sepulchres of their deceased relations, which the priests regale themselves with after the people are gone. The magistrates and other great men also solemnize their birth days every year much in the same manner as we do in Europe; and on such occasions they receive the compliments of their friends and relations, who bring along with them considerable presents.

At all their entertainments, they have some sort of comedies or farces acted, which is generally in the night, and continue from sun-setting till sun-rising. But during the whole of the entertainment the people regale themselves with all sorts of fruits and sweetmeats; which are served up to them with the utmost profusion. Their other diversions are hawking, hunting, and fishing, at all which they are very expert. In travelling they generally go by water, much in the same manner as the people of Holland; and along the sides of their canals they have little huts erected, where they can have any sort of refreshments. The baggage of their generals, or great men, is commonly carried by elephants over land; for, besides these, they have very few beasts of burden.

The manufactures of this country are in most respects the same with those carried on in Japan and China. They make all sorts of silks and muslins, and, except what they use themselves, they sell most of the residue to the Dutch and English. They carry on many manufactories of lacquered wares, which they sell to considerable advantage; and though they are not equal in beauty to those made in Japan, yet they are superior to what is to be met with in China. The difference consists more in the texture of the wood than in the varnish, the wood in Japan being far superior to any other in the East Indies. The lack of Tonquin is a gummy juice, which issues out of the bodies or branches of trees, and is gathered in great quantities by the country people. It is of the thickness of a cream, and the natural colour white, but the air changes it, and makes it look blackish. The cabinets which are lacquered with it, are made of pine-tree, a wood much resembling fir, but not so good; and their workmen are but indifferent artists. Their lacquer-houses are considered as very unwholesome, from a poisonous quality said to be in the lack, causing the workmen to break out in great blotches and biles. The lack can only be laid on in dry weather, for as there must be several coats, one must be dried before the other is laid on, otherwise the whole

would

would be spoiled. When the outward coat is dry, they polish their work to give it a gloss, which is done chiefly by rubbing it. There is no better glue than the lack will make, and it is very cheap in this country, but it is not permitted to be exported. They make great quantities of earthen ware, of a greenish colour, which they sell to the merchants of the Philippine islands; for it is not much esteemed by the Europeans. From hence also are brought vast quantities of turpentine, musk, and rhubarb, with several other sorts of drugs. They have also large quantities of silver, most of which they sell to the Europeans.

Tavernier tells us, that in this country there are great quantities of Lignum aloes, but there are so many different sorts, that some sell at ten times more than others. If it be close and oily, a piece of the bigness of a pea, thrown into the fire, will perfume a room as much as if it was twenty pounds weight. In this country is likewise found wood for dying, much resembling logwood, but not so large; nor does it give such a lasting colour to the cloth. Although there are vast quantities of silk in this country, yet the people seldom apply themselves to the working of it, till the merchants from Europe arrive; and the reason is, their petty princes have so much power and authority over them, that no sooner do they imagine the poor creatures are getting a little money, than they seize upon the greatest part of their effects.

In this branch of trade the Dutch excel all other Europeans, by that sort of ingenuity which flows from meanness, and is supported by chicanery. They contract marriages with some of the women, whom they leave behind them as their factors; and these women prepare the goods for them upon their return. Many of the Dutch have acquired fortunes by this species of illicit trade; and the women who submit to this kind of temporary prostitution, are so far from being despised, that, by procuring money, they are frequently married to some of the greatest persons in the kingdom. It is true the government might restrain this practice; but were they to do so, they would lose the whole business arising from the Dutch trade.

The Tonquinese make no long voyages, nor are their goods exported on their own bottoms, except fish and rice. They employ foreign shipping, for few of their vessels will bear the hardships of a long voyage. They are, however, more just in their dealings than the Chinese, and perform their contracts with greater punctuality. Most of their ships are so small, that they cannot venture far out to sea; and the mariners, if they deserve that name, are but little acquainted with navigation either in theory or practice. But still they carry on a very extensive fishery, great part of which they sell to the Chinese, and the natives of Japan, particularly turtles, which are in great repute in that part of the world. Butter and fowls are in great plenty, and their orchards produce large quantities of fruit. Sometimes the country is much infested by locusts, which swarm in such numbers, that they almost darken the air. There are very few small birds in this country; but they are frequently plagued by swarms of gnats, which are very troublesome, as well as their ants. Tavernier says, that these ants are so mischievous, that they will eat through a bale of silk in twenty-four hours, and it will look as if it had been torn asunder.

None are permitted to enjoy any places of trust or importance under government until they have gone through a liberal education, and taken their degrees. Their method of learning is much the same with that used in China, nor is there any material difference in their forms of examination. Their characters are also the same with those used in China, but the pronunciation is different. They do not sit writing at a table like the Europeans, but, standing up, hold the pen in one hand, and the paper in the other, beginning at the top, and writing to the bottom. Their phy-

sicians are a parcel of strolling vagabonds, who pretend to cure all sorts of diseases by magic, and sometimes by the use of herbs, roots, and simples. They never bleed their patients, and in all other respects, they are as unskilled in surgery as physic; and the people are so ignorant, that they believe every thing related by them.

Their mechanics are more ingenious; for they have in this country, besides such artists as are peculiar to themselves, very good smiths, carpenters, weavers, turners, potters, painters, and in general all sorts of handicraft-trades whatever. The women are not so much under restraint here as in China, for they are permitted to deal with strangers, a circumstance which, as we have already observed, the Dutch avail themselves of. Nay, even prostitution is not considered as a crime, so that any temporary advantages may arise from it.

Their form of civil government has something in it which bears strong marks of antiquity; for although the prince succeeds his father in a hereditary line, yet he is under many restrictions. He cannot execute any act of power without the concurrence of his great officers of state, who all succeed their parents in the same manner as the prince does his. This is in some measure what we call an aristocracy; and it prevents many cabals which otherwise would frequently take place among the subjects. Here are no schemes formed by disappointed adventurers to supplant ministers of state; for their fortunes, titles and offices, are all joined together. This was once the form of government in many European nations, but little remains of it are now left, commerce having, by producing riches, triumphed over its ruins.

The king, whose residence is at Cachao, has an army of at least one hundred thousand men, dispersed throughout the different provinces, and three hundred of these always attend at court. The greatest number of these consist of foot; for there being many islands, the use of horses are rendered unnecessary. The soldiers are disposed in different divisions, much in the same manner as our regiments; but they are so little acquainted with the military art, that they are easily put into confusion, and as easily routed. Most of them are trained up to shoot with arrows, and some of them are excellent marksmen. To instruct them in this art, they have butts fixed up, and they are frequently called out to exercise. If any of them happen to mistake in taking their aims, they are immediately put upon double duty, and continued upon it till they make a further progress.

Great part of their forces are kept upon the borders of Cochin China, whose inhabitants are almost their only enemies; and between the out-guards of each kingdom there frequently happen skirmishes, though they seldom come to a general engagement. The army can never take the field but in the dry season, for there is no possibility of encamping during the rain.

When the army marches, the general officers are mounted upon elephants, in little wooden tents, the same as are commonly called Castles, which are fixed to the beasts with ropes, which incircle their bodies.

The king's naval force is very insignificant, consisting only of a few galleys, or small boats, which are of little or no manner of service to him. But notwithstanding the insignificance of these vessels, yet they are of great service in preventing smuggling; for the king of this country is so intent on supporting his title to his revenues, that no foreign vessels are permitted to come into the harbour till such time as they have paid the accustomed duties. But as no laws can in all respects restrain the avarice of men, so we find that the orders of the king of Tonquin, notwithstanding their severity, are easily eluded. This is done by giving a small present to the officers, which they are the more ready to accept, because they receive no gratuity when they seize the goods belonging to smugglers.

Here are no courts of justice, but any single magistrate may cause an offender to be brought before him, and inflict such punishment upon him as is consistent with the laws of the country, without any formal process; and the sentence is executed immediately. Beheading is the common punishment for murder, and other capital crimes; and the execution is generally performed either before the door of the criminal, or on the spot where the crime was committed; but this part of the sentence is sometimes dispensed with.

The criminal is laid upon the ground with his legs stretched out, and the executioner strikes off his head with one blow. Women convicted of adultery are thrown to the elephants, who tread them to pieces; and petty thefts are punished in an arbitrary manner, such as by whipping, and sometimes condemnation to the galleys. All the inferior officers who attend the court are eunuchs; nor can any person whatever have admission to the king, without applying to them. When one of these eunuchs dies, all their goods, and indeed every thing that they are possessed of, becomes the property of the sovereign. In some countries this would be considered as a hardship; but it cannot be so here, when we consider all the circumstances together. Eunuchs in those eastern countries are made so in their more tender years; so that being as it were brought up without passions, and seldom knowing who their parents are, cannot have any attachment to the affairs of this world. But as Sir Roger L'Éstrange says, "Shut nature out at the door, and she will come in at the window." So these eunuchs are extremely fond of playing with young girls, and these girls they frequently recommend to the Europeans who trade thither, and take it kindly if they will purchase them for a small gratuity, which is generally complied with.

Once in the year the king orders all his subjects of proper age to take an oath of allegiance; and on such occasions every person drinks a cup of the blood of some fowl mixed with arrack, which is esteemed the most solemn tie they can lay themselves under. They weigh all their money, for except some small pieces of silver they have but few coins of their own. In general, they procure dollars from the Europeans, and give them in exchange for the natural or artificial products of the country.

Their religion is much the same with that of the Chinese, and indeed it seems to be from the same original, for they consider Confucius as a prophet. Their pagods, or temples, are however mean structures, being mostly built of wood, and covered with thatch, and sometimes little bigger than to hold the image of the idol. In the towns, however, they have a more graceful appearance, some of them being equal to those in China, but these are few in number. Their priests lead a very austere life, which their poverty in some measure compels them to, having but little to subsist on besides the free offerings of the poor people who attend the sacrifices. They live in mean huts near their pagods, where they attend to offer up prayers for those who bring them small presents, which generally consists of a few handfuls of rice.

If the people bring their petitions in writing, the priest reads them before the idol, and then burns them on the altar. People of quality seldom come to their temples; but, instead of a priest, employ one of their own domestics to read their petitions in an open square before their houses. During this ceremony, the master of the house lies prostrate on the earth, as if ashamed to lift up his eyes to Heaven. The paper read by the domestic, contains a recital of all the favours he has ever received, such as health, riches, and the king's favour. It concludes with a prayer for the continuance of them, after which, the reader sets fire to the paper in a pot of incense.

On all such occasions great store of provisions are dressed, and these are given away to the poor, who acknowledge the favour with all the marks of unfeigned gratitude. This is an antient custom, for so far as

we can learn from history, all religious rites and ceremonies in the early ages of the world were accompanied with acts of benevolence. The jesuits have told us several romantic stories concerning the vast number of converts they made among these people, and likewise of the churches they erected; but at present there are no remains of their religion in the kingdom. This circumstance will not appear strange to those who consider that the jesuits, by converting these heathens, only led them from one species of idolatry to another.

The women are not treated in this country consistent with that respect which is due to their sex, or with that tenderness which they have in the order of nature a right to expect from the men. Wives are purchased in the same manner as in China, nor are the men confined to a certain number, being permitted to marry as many as they can support. Nay, such is the weakness of paternal bands, that not only the poor, but even the rich, sell their sons and daughters to merchants, as mere articles of commerce. They are very extravagant in their weddings, and the man must be extremely poor indeed who does not spend three days at least in feasting on such occasions.

Divorces are frequent amongst them, and the whole of the ceremony consists in the husband and wife consenting to part, and then they break in two pieces, before witnesses, the sticks which they use in eating their victuals. In their funerals, they have several ceremonies peculiar to themselves, but in some respects resembling those used in China. Thus they all bury their dead; but whereas in China there are public burying grounds, here every one buries his dead in his own garden, or in any part of his estate he thinks proper. Within one month after the funeral, there is a feast held at the grave, at which the priest assists; and if the deceased was a man of quality, a pillar is erected to perpetuate his memory. This pillar is either of wood or stone, according to the circumstances of the deceased, or the will of his executors, and is in general from twenty to forty feet high. Hither the country people in the neighbourhood resort, and find plenty of all sorts of provisions prepared for them, which are served out under small sheds erected for that purpose. These people being assembled, the priest ascends the pillar erected over the grave, and makes an oration suitable to the occasion. In this he expatiates largely on the virtues of the deceased, and recommends his conduct as a proper object of imitation.

This part of the ceremony being over, the priest comes down, and another temporary building having been erected, the people set fire to it, and drink and dance round it, till it is consumed. These solemnities, however, are generally attended with many inconveniences, and some fatal accidents often accompany them. The people by getting drunk often quarrel with each other; and sometimes, before the disputes are settled, murders are committed. These crimes, however odious in their own nature, are but little attended to, for the thing itself being fashionable, the practice is continued from time to time with impunity; and, to the dishonour of the civil government of the country, the passions of men are suffered to trample over and bear down before them the rights of the civil magistrate.

When the king of Tonquin dies, he is laid in state for sixty-five days, and meat is served up to him as if he was alive, which, in the evening is given to the poor, and to the bonzes or priests. At the end of the sixty-five days the corpse is interred with great pomp, in the burying place of the royal family, the ground being covered all the way with violet-coloured cotton; and though the tombs are not above two days journey from the royal palace, yet the procession generally takes up three weeks. All the great officers of state, as we are assured by Tavernier, go into mourning, and continue in that dress three years; but this severity of custom is frequently dispensed with.

with. The king's favourite queens are buried alive with him, and this barbarous ceremony is performed in such a manner as is shocking to human nature. The corpse of the king being deposited in the tomb of his ancestors, the women are all put into one grave, and the earth thrown over them; and lest their cries should have any effect upon the spectators, they are dispatched as soon as possible. These women are not compelled to sacrifice themselves in this manner, but their characters would be totally ruined were they not to comply with an established custom; which long practice has, in some measure, induced the people to look upon it as sacred.

We shall conclude this article with what the above mentioned learned and ingenious travellers have told us concerning the island of Formosa; and this is the more necessary, because the Europeans have been led into great mistakes by the writings of Pfsalmanazar, a man who on his death-bed repented that ever he had been guilty of such forgeries.

Formosa is subject to China in some measure, but not absolutely so, for the Japanese likewise pretend to a sovereign authority over it. Justly it is not in all respects subject to either; but only occasionally, when power predominates over right. It is situated to the north-east of China, and is about four hundred miles in circumference. It was not much taken notice of by the Chinese till the year 1662, when the Tartars subdued that empire, and they still keep possession of it. About two hundred years ago some Spaniards established a factory here, which for some time was of considerable advantage to them; but the restless tempers of the jesuits defeated all their operations, and deprived them of all the rewards of their industry. These fathers, with all the Spaniards, having been driven out, their churches were totally destroyed, and there are no remains of them now left.

The people here are very barbarous in their manners, which can only be ascribed to their want of commerce with foreign nations. It is true, the Dutch sometimes trade with them; but when their ships arrive, the sailors are kept under such restrictions, that they are never suffered to penetrate into the country. Their mountains are full of brimstone, which occasions many earthquakes; for the country being in general parched with heat, these explosions burst out frequently with such velocity, that the irruption spreads devastation through the neighbouring plains. As there are few rivers in this island, but at the same time a great number of mountains, so at the bottom of every hill there is a lake impregnated with sulphur. Their fields are extremely agreeable, and the country produces all the necessaries of life. They plant great quantities of rice, which is sold to such persons as trade with them, but these are not numerous. The Chinese exact an annual tribute from them, but that is not regularly paid; for, notwithstanding these nominal subjections, they still look upon themselves as free, and they assert their independency as often as they have it in their power, which frequently happens.

The women do all the drudgery work of husbandry, such as plowing, sowing, and reaping the fruits of the earth; and this is so common, that they never complain of any hardships they undergo. The men spend most of their time in hunting, and such other exercises of a manly nature; for they have no occasion to engage in wars, being in general under the protection of the Chinese or Japanese. Their houses are built with mud, through which canes are fastened, and they are covered with thatch. They have no towns of any note, but only some small villages, which are built in such a manner adjoining near to each other, that the whole island may be called a rural city.

In their religion they are gross idolaters, and worship all the heavenly bodies, particularly the sun, which they adore in the morning, with their faces turned towards the east. In all their other religious ceremonies, they are much the same as the Chinese, except that they are a little more barbarous, particularly

in their offering of sacrifices, for whereas the Chinese kill the victim, these idolaters generally offer them up alive, and let them expire under the most excruciating tortures. They have several temples in this island, but there are none of them that merit a particular description.

Tavernier, as well as several other travellers who have visited the eastern parts of Asia, frequently lamented that the European merchants, who settled factories in those parts, never troubled themselves to attend to other things worth notice, besides commerce. The observation is just, and our defects with respect to the want of a proper knowledge of East-India affairs, and the manners of the people, would have continued to be what it was in the last century, had not some men of learning and knowledge in the present age made discoveries in places unknown before: but of that we shall speak more at large afterwards. In the mean time we are naturally led to consider the country known by the name of Cochin China.

This kingdom is bordered on the east by the Indian ocean, and on the north by Tonquin. Another branch of the Indian ocean washes it on the south, and towards these, are vast lofty mountains bordering upon China. It is divided into five provinces, the whole territory being little above four hundred miles in length, and rather less than two hundred in breadth. The king keeps his court in the province of Siam, which is the capital city, and here the houses are in general two stories high; for as their streets are apt to be overflowed in the rainy season, on such occasions they remove from the lower to the second story, till the waters subside. That a proper communication may be kept up between the inhabitants, they have small boats, in which they sail from one house to another. Like the people of Tonquin, they sit cross-legged on the floor, and have mats under them, coarse or fine, according to their rank. They wear silk and cotton vests one above another, and swathe their legs with silk instead of breeches. Their manner of dressing their victuals is the same as in Tonquin, which may serve to shew that there cannot be any great difference between the origin of these people.

They are extremely curious in hatching fowls; and there is something so remarkable in their bird's-nests, that it merits a particular description. These nests are built by a small bird, like a swallow, in the rocks upon the sea-coast, are composed of the sea froth, and a viscid liquor from the bird's stomach, which hardens by the heat of the sun, and is almost transparent. This being softened in warm water, is pulled in pieces, and, being put into broth, is considered by the people of the country as very nourishing, as well as pleasing to the taste. The people climb the rocks to seek these nests, and it is surprising to think what dangers they will expose themselves to.

They have all sorts of animals, both wild and tame, as in the kingdom of Tonquin; and, except in one single instance, they have the same sorts of trees and plants. This particular tree is extremely hard, and weighs almost as heavy as lead; so that it is made use of for anchors. They have also the aquiba tree, remarkable for its fine flavour when cut in pieces; and this is so much esteemed in the country, as conducive towards promoting health, that many of the people make pillows of it. This is the wood used by most of the East-India nations, when they burn their dead.

The Dutch have represented the inhabitants of this country as very humane to strangers; but this is contradicted by the English. The truth seems to be, the Dutch, as a cunning people, having ingrossed the whole trade for themselves, curry favour with the people, and conceal from the world all the indignities they have from time to time shewn to the English. The jesuits tell us, that they are well acquainted with the mathematics; but this cannot be true, for these fathers contradict themselves frequently, particularly in this instance; for they first tell us, that the inhabitants had considerable knowledge in the sciences, and then

then they add, that they are utterly ignorant of mechanics, and the first principles of geometry.

In the islands, of which there are several adjoining to this kingdom, and subject to its government, nothing can be more delightful than the vast number of small brooks, which generally terminate in lakes, which are well stored with fish. These brooks add much towards promoting the health of individuals; but this is the reason why few diseases are so little known in this country. Prostitution is not considered as a crime among them, for nothing is more common than for fathers and husbands to bring their wives and daughters on board the European ships, and offer the enjoyment of them to the seamen for a small gratuity. The inhabitants are idolaters, and in one of their temples is the image of an elephant on one side of the altar, and that of an horse on the other.

In 1704, the English established a factory at Candore, and settled several persons in it to conduct the trade; but the inhabitants became jealous of them, and resolved upon their destruction. This was easily effected, because the English being few, and not properly supplied with arms and ammunition, soon became an easy conquest to numbers; the English governor was taken into custody, and confined above one year in prison, but at last he was set at liberty, though not till he had consented to bind himself by oath never to return again into the country.

Farther westward of Tonquin and Cochin China, is the famous kingdom of Siam, bounded by the Indian sea on the south; on the west, by the Bay of Bengal, and Pekin circumscribes it on the north-west. Under Siam we comprehend several provinces, particularly Cambodia, Laos, and Malacca; for though all these were formerly distinguished from each other, yet they are now united under one form of government. The outward town in this kingdom resembles a crescent; but the interior part, which is Siam Proper, is divided into ten provinces. All these provinces are under the government of particular officers, appointed for that purpose; and under them are many subordinate jurisdictions.

As this kingdom extends almost from the Equinoxial Line to the Tropics, we must naturally suppose that it is extremely hot; but however, this is in some measure alleviated by the cooling breezes from the sea, and the numbers of rivers with which the country abounds. There are several other circumstances which conspire towards promoting the healthiness of this place, and making it in many respects superior to some other parts of the world, where the climate is the same; but these advantages are wanting: and this should be attended to by all those who would desire to understand the nature of foreign countries.

The chief city of Siam is called sometimes by the name of the kingdom, but more frequently *Odioa*, and is situated on the river *Menan*, about fourteen degrees of north latitude. It is three leagues in circumference, fortified with a wall, and several towers; and many branches of the river divide themselves to surround it. Thus it in some manner resembles an island, so that there is but one way of crossing from the continent by land. This is towards the east, where there is a causeway to go out of the town, without being obliged to cross by water. That which is properly called the town, does not take up above a sixth part of the ground within the walls. The intermediate spaces are taken up with temples, surrounded by convents for their priests, or talupoins. Near these temples they have their burying grounds, with pyramids erected over the graves of the most illustrious personages, which, with their spires, make a most agreeable appearance at a distance.

The streets of the city are large and straight, and some of them are paved with brick, having canals cut through the middle, over which are several arches, which has occasioned the Europeans to compare this city to Venice. Most of the houses are built of bamboo, which is a sort of ever-green cane, and these

houses or huts are fixed upon wooden pillars several feet above the ground, which is altogether unnecessary.

The buildings are not regular, some of them being small, and others large; but the apartments are so contrived, that the rooms for the men and women are kept separate.

On the north of the city stands the king's palace, built of bricks, and surrounded by stone walls, with as many ditches. The inward court of the king's palace, is called *Vang*, and in it are included several gardens, groves, and canals. It is remarkable, that the king's palace is no more than one story high, and yet some of the rooms were extremely elegant. No person who has any business with the king is admitted any further than the first room, within the gates, where he is obliged to deliver his message to the officer in waiting. If he is an ambassador from a young prince, the king frequently waits upon him; but in all other respects, he is not admitted to go any further.

As the king delights much in hunting, he has several palaces in the woods, built chiefly of bamboo and painted reed; and there he lives during the hunting season. But, to return to the palace, which is the immediate subject of our enquiry, we shall only observe, that the gates are kept always shut, and no man is permitted to go in with arms upon him.

Between the two first walls, a guard of armed soldiers are placed, who are always ready at the will of the prince to execute his orders. Generally the kings of Siam used to hire a guard of Japanese, but those becoming rather too insolent in their conduct, the people became jealous of them, and they were dismissed. The horse-guards are divided into two bodies, commanded by their respective generals; and, besides those, the king has another guard, composed of one hundred and forty gentlemen; two troops of these are Mahometans, from the Mogul's dominions; another troop is composed of Chinese, and the rest are natives of Lao. Many of our modern travellers have represented these guards as men endowed with so much courage, that nothing can make them afraid. But the ingenious *Loubier*, who resided many years in this country, has made it appear, that their fortitude arises from artifice rather than from principle. He tells us, that, previous to their engaging in any expedition, they take a certain quantity of opium, which stupifies their senses, and renders them insensible of danger. Thus they acquire the character of persons endowed with fortitude, while, at the same time they have no further right to that appellation than what comes from the influence of medicines.

Within the first wall of the palace, are the stables for the king's elephants and horses, each of which have a name imposed upon him, alluding to some of their qualities. Every elephant has several men to serve him, and is treated with more or less honour, according to the name he bears. They are never permitted to stir out without their gaudy trappings, and more than necessary ornaments. These creatures are so docil and quick of apprehension, that the people believe them to be animated with human souls, and these souls they believe are those of some illustrious princes. The white elephant which they pretend is not to be found any where but in Siam, is supposed to contain the soul of one of the Siamese kings, and therefore the present sovereign never presumes to ride on him.

In his seraglio he is much like the Chinese, for he has a great number of women, but he pays little regard to them, there being in general one whom the people consider as queen, and the king treats her as mistress of his affections. The rule of succession to the sovereignty is no ways fixed; for though the king has a favourite queen, yet it frequently happens that her son is declared illegitimate, and the son of the first woman with whom he cohabited succeeds. But in this there is no rule, for it is in the power of the prince to nominate a successor, without consulting any person whatever.

Loubiere, speaking of the people of Siam, remarks, that in countries very hot, or very cold, we may observe something sluggish in the people; and this operates both upon their minds and bodies. In cold countries, it leads to stupidity; but in warmer climates, it stagnates all the powers of the human mind, and renders men as it were altogether inactive.

This argument, however, will not hold good; for in China, which is not far distant from Siam, and like it situated within the tropics, the people are as industrious as any in the world. The Siamese, he acknowledges afterwards, have not clear conceptions of any thing imparted to them; which is inconsistent with that illiberal reflection he throws out against some other people, as well as them, when treating on the manners of the people in different nations.

As for their not acquiring any great perfection in the arts and sciences, it is not much to be wondered at, when we consider that they have no proper instructors.

Loubiere, who perhaps is one of the best writers we have, tells us, that these people are polite, and yet they are revengeful. How these seeming contradictions can be reconciled, we shall not attempt to shew; but thus much is certain, that these people of Siam are so much addicted to their antient customs, that they cannot endure the thoughts of a change. The truth is, Loubiere had no intention to deceive his readers, but, like most of the rest of his countrymen the French, he was hurried away by the impetuosity of his genius, and consequently was led to advance some things as truth, which had no further existence than in his own imagination.

This will appear the more probable, when we consider what he says in another place; namely, that their minds are cool in their passions, never ruffled, and that they are all born philosophers. And it is farther added, that although we frequently impute their want of curiosity to a natural defect of sensibility, they laugh at the disquiet we give ourselves in making discoveries which lead to no real advantage. He adds farther, that they are great lovers of their wives; and yet they can divorce themselves as often as they please. Nay, such is the rigorous law of the country, that there is no necessity for bringing an offending wife before any sort of civil justice. It is sufficient that the husband is displeased with her, and then he can put her away, without shewing any cause whatever.

Loubiere adds farther, that the heat of the climate makes the people cowards. This is a bold and unsupported assertion, for although nothing can be more natural than to look for courage among those who are born in northern climates, yet we have the evidences of the most indisputable historians to countenance our asserting, that even the inhabitants of Africa, now the most effeminate people in the world, were once formidable to the whole power of the Roman state.

The truth is, courage does not so much depend upon climate, as upon the government of the country, which generally forms the manners of the people. From these principles flow all the consequences in human life. Governments may be instituted with great care, but the effects of their operations can never be known until the theoretical part is reduced to practice. The courage of men is in general proportionate to the principles which they imbibe in their youth, and habits flowing from first principles generally form the man. All his actions are tinged with this ever afterwards; and he lives and dies either a ferocious savage, or a pusillanimous coward.

The people of Siam are not very different from those of China, with respect to their complexion and figure. The men wear their hair over their shoulders, and in most respects the women dress in short petticoats, having nothing indecent about them. They bathe themselves two or three times every day; but sometimes they content themselves with having water

poured on their heads. They afterwards perfume their bodies, and make use of a sweet pomatum, which makes their lips look much more beautiful than before. This custom, like some others we have already mentioned, is of great antiquity, and must have taken its rise in the more early ages of the world.

The habit of a man of quality is a piece of calico, tied about his loins, which reaches down to his knees. He has also a muslin shirt without a collar, with a wide sleeve, and no ribbands, with the bosom open. In winter they wear a mantle of coarse cloth over their shoulders, and wind it about their arms. The king of Siam wears a vest of brodered fatten, which reaches down to the waist, under such a vest as has been already described. But it is not lawful for any person to wear a vest of this shape, unless the king grants them permission. Slippers are worn, with pecked toes turned upwards; but they know nothing of stockings. The king presents his generals with a vest which reaches to the knee, but the sleeves come no lower than the elbows; and either in war or hunting, the king, with all his retinue, are clothed in red. The king wears a cap in form of a sugar-loaf, ending in a point, with a circle or coronet of precious stones; and his officers have circles of gold, silver or vermilion, according to their different ranks, to distinguish their quality, and these are fastened under their chins; but they are not permitted to wear them in the presence of the king.

They have hats also for travelling, but very few people will be at the expence of purchasing them; for they seldom cover their heads, although the sun may happen to be ever so scorching. The women wrap a piece of cloth about their middle, which hangs down to the calves of their legs; and the men bring up the end of this cloth strait between their legs, and fasten it to the ends of their girdle, which makes it resemble a pair of breeches. The women have also another cloth, with which they cover their breasts, and throw the ends over their shoulders. The rest of their bodies they leave naked, having no shifts on, nor any covering for their hands. The common people go almost naked, and wear neither stockings nor slippers. The women bathe in the rivers in the same manner as the men, but they have always something about them to cover their nakedness. Loubiere speaks much of their modesty; but perhaps some exception may be made to this assertion. It is certain, that notwithstanding the encouragement given to polygamy in the east, and the severity under which the women are kept in a state of restraint, yet female modesty is not so sacred as some are apt to imagine. The women wear as many rings on their fingers as they chuse, according to the nature of their circumstances, or the generosity of those husbands who chuse to distinguish them by such acts of favour.

Those who have the education of youth, teach them, as their duty, proper respect and submission to their superiors. They are not to talk in company without permission, because a profound silence is observed in the king's court. No person is allowed to traduce the character of another, although he knows the accusation to be just; and it is reckoned very ill manners in company for a young man to pretend to be wiser than those more advanced in years. It is reckoned insolent to stand before a person of quality, and therefore slaves sit upon their heels, with their heads a little inclined, and their hands joined together and lifted up to their foreheads. In passing by a superior in the streets, they bend their bodies and lift up their hands in a proportionate height according to the dignity of the person whom they honour.

When an inferior makes a visit, he comes into the room stooping, and kneels down, continuing in that attitude till the prince commands him to arise; for it is a rule that the persons of the highest quality shall always speak first. When a man of quality visits his inferior, he walks with the most stately air into the house, and is received in the most obsequious manner; and the host conducts him, after business is done, to

the door, but no further. On such occasions, arrack is set before the guest, and he drinks what he thinks proper, but few words pass besides what are necessary.

The highest part of the house is always the most honourable; for none but slaves or servants choose to lodge under the feet of others. Indeed there is not much occasion for this punctilio, because, except in the houses of the great, they have seldom more than one floor in the building. It is, however, different in the palace, where the fabrick rises up in the form of a pyramid, so that it consists of several stories.

The right hand is reckoned the most honourable in Siam as well as in Europe, and that part of the room which is opposite to the door is, out of respect, appropriated for the reception of strangers. When a person comes unexpectedly into a room, it generally occasions much confusion, because it is at first difficult to find out his quality, so as to treat him with proper respect. None are permitted to touch those who sit beside them in company; for were they but to lay their hands upon their caps, it would be considered as a very high affront.

Amongst their diversions, that of hunting the elephant is the most remarkable. The male is taken by leading a female elephant into the wood, who with her noise invites him into a narrow place between two banks of earth, fortified with the bodies of trees, and the passage gradually grows less and less, till the wild elephant is so wedged in that he cannot turn himself. Then the huntsmen contrive to hamper his legs with ropes, and bring two or three tame elephants, who compel him to march between them, and thus in a few days he is brought under proper discipline.

They have mock fights with elephants, but they are kept at too great a distance to hurt one another, for in Siam they neither expose the lives of men or beasts merely for sport. They were formerly much addicted to the barbarous custom of fighting cocks, but that has now subsided, and every person who is found acting in that manner is severely punished. Loubiere says, "A festival is annually celebrated when the waters begin to retire, for the tides are not there so regular as in Europe. On these occasions they go out in their barges in the evening, and they have so many lanterns along with them, that the whole river appears as if it had been illuminated. All their lanterns are made of painted paper, and for three nights successively they return thanks to their idols for the clemency of the season, and the fertility of the ground. They also make another magnificent illumination, to express their gratitude to heaven for the fruits of the earth after harvest; and not only their barges, but their houses and streets are all illuminated, and several curious pieces of fire-works are played off. They are so fond of boyish diversions, that the king often goes out in the winter evenings to see the boys fly their kites, which is in all respects consistent with eastern effeminacy.

There are several other kinds of diversion which I shall here mention, and the first is that called the come. The come is a figure dance, at which they use violins and some other musical instruments: Those who dance, are armed and masked, and seem to be really engaged in fight, rather than at a common sort of diversion, and their masks make them appear like monsters and devils.

Another festival is the laycone, and then the actors sing verses alternately, containing encomiums on the great men they have had in their country, and repeating the history of their kingdom. This species of entertainment was peculiar to the antient nations in general, and to none more than the inhabitants of Britain. Thus the antient Britons had their bards; the Saxons, their minstrels; and the Scots and Irish, their songsters. In all public assemblies, these hirelings are employed to recite the actions of their ancestors; and Dr. Percy has adopted the sentiment, in his celebrated ballad, entitled, *The Hermit of Warkworth*:

Lord Percy made a solemn feast,
In Alnwick's princely hall,
And there came lords, and there came knights,
His chiefs and barons all.

Another of these feasts is called the rabain, which consists of a double dance of men and women, and they have all long, artificial nails made of copper. They sing in the dance; which is only a simple, slow movement, without any high motion, but with a great many distortions of the body and arms. Those who dance in the rabain, have high gilded caps, made in the form of a sugar-loaf. At this diversion they have mock fights; and wrestlings with oxen, one against another. Sometimes yokes of oxen are appointed to fight other yokes of the same animals, but seldom any great mischief is done.

One of the most common diversions among them, is rowing for wagers, upon the river, in their barges, for they are expert at the oar from their youth. They love gaming to such a degree, that, besides playing away all their personal and real estates, they often lay at one stake their wives and children. On the first day of the new moon they abstain from all manner of labour, and the common people present their offerings to their priests. In these offerings they do not confine themselves to money, for they frequently carry to their priests pieces of silk, calico, tea, coffee, and such other things as the country produces, and these they bestow in such quantities as is consistent with the nature of their circumstances.

On all holidays, the people dress themselves in their best cloaths, and as an act of charity they redeem several animals who are in a state of confinement, and turn them out on the forest at large. This they do in consequence of the notion, that in all animals human souls are lodged. Their offerings are presented by the priests to their idols; but they are soon after converted to the priests own use. Lighted tapers are sometimes offered, but never any bloody sacrifice, the killing of animals being prohibited among them.

The principal food of the Siamese is rice and fish, both of which they have in great plenty. A pound of rice will serve a man a whole day, and that costs only about a farthing of our money, and they may have along with it above two pounds of fish at an equal expence. A pint of arrack amounts to about two pence; so that subsistence being extremely cheap, the people pay little regard to labour, and are in general very indolent. They are much addicted to the use of tea and coffee, and all other sorts of luxuries peculiar to the effeminacy of the eastern nations, which serves in some measure to throw a languor over their spirits, and render them totally unfit for manly exercises. This part of their conduct will not require much illustration, when we consider that there has been in the eastern nations an uniformity of manners from the most early ages of time.

In former times the trade of this country was far superior to what it is at present; for it frequently happened that one thousand vessels came into their ports in one year. But their kings being jealous of the merchants, who were endeavouring to acquire fortunes, thought that they would enjoy part of their riches in rivalry with them; and, in consequence of that mean selfish opinion, laid such restrictions on commerce, that the merchants were discouraged; for what man will undergo hardships and risque his fortune, while at the same time another is to enjoy the fruits of his labour? This throws such a dejection over the spirits of the people, that they are now become, in a manner, total strangers to industry. No young man serves an apprenticeship to any particular trade, but every one follows whatever he pleases, and this is the reason why there are but few ingenious artists among them. Those who have any money, knowing that they cannot lay it out in the way of trade, hide it under ground, lest it should be seized, and torn from them by the king's officers. They would
give

give encouragement to European artists; but supposing they were to receive any emolument from their ingenuity, it would be seized by the king; and this is the reason why none of the Dutch or English will settle among them.

They have but one sort of silver coin; which they call a tycall, but they are not all of the same size or value, nor have they all the mark stamped upon them. They are of the figure of a cylinder or roll; bent both ends together, with characters on each side, in their own language, explaining their value: They have no copper coin; and as for gold, they sell it as an article of commerce, estimating it at twelve times in value to silver. Their ships are little better than out common barges; and they are so few in number, that they never would be able to transport their goods, unless strangers were to come and purchase them.

As the country is in general mountainous, they are obliged to have recourse to a particular sort of agriculture, which differs from the practice of most other nations in the east. As the floods during the rainy seasons frequently descend from the mountains, so they find it necessary to make small canals to carry off the rain. They plough with oxen and buffaloes, and guide them by putting a rope through their noses. Their plough is plain and without wheels, and there is a shaft by which the plowman conducts it. They sow rice in several parts of the kingdom on grounds that have not been overflowed by the rain from the mountains, and this grain is reckoned by the Europeans superior to all others that can be met with, or purchased in the East-Indies.

The Siamese cultivate their gardens no less than their fields; and in general the country produces all the necessaries of life. Their fruits are in a manner innumerable; and as for flowers, they have many in common with us, and many not known in Europe. All the hilly parts of the country are covered with wood; but the tree most esteemed among them is the bamboo, which grows chiefly in the marshy soil; and, like reeds and sedge, grows also by the sides of ponds. They have timber fit for building of ships, and for masts; but their cordage is made of the outskin of the cocoa tree, twisted together in the shape and texture of ropes.

They have cotton-trees in great plenty, but yet it does not appear that they manufacture that useful article to the best advantage. They have few sheep or goats, and neither of them are good eating. They have such vast numbers of domestic fowls, that they are sold in a manner for a very inconsiderable sum. The inhabitants kill deer only for the sake of their skins, which they sell to the Dutch, who carry them to Japan, and dispose of them to considerable advantage. The greatest danger attending a journey through this country is, the vast number of snakes, lizards, and other noxious reptiles, who every now-and-then start up and sting to death the person who is not upon his guard, and to be continually watching to avoid them is no easy matter.

In travelling they frequently make use of elephants, but more commonly asses, mules, and horses; and some of them who are rather of the lower sort, ride on oxen. Every one is at liberty to hunt the elephants, and they may take them if they can, but this is rather a piece of diversion, than any thing attended with pecuniary emolument; for it does not appear that the skins of elephants are of any great value; and as for the flesh, it is of no value at all.

They have very strange notions concerning the principles of philosophy and astronomy. They believe that the earth is square, and of a vast extent; and that the arch of heaven rests on it at the extremities, as on a solid basis. There are some persons among them who pretend to foretell future events, and these are called magicians; but they are only impostors, who impose upon the credulity of the people. And yet neither the king nor any of the people ever undertake any thing of importance without consulting them. They are wretched slaves to every

thing of a superstitious nature, and dreams and omens are looked upon by them as revelations of future events. In this however there is nothing at all surprising; for there is not perhaps in the world a single nation where superstition does not more or less prevail. This is the reason that knowledge seldom ripens to maturity; till the cause has become so deeply rooted, that the effects are in a manner rendered abortive.

There is no distinction of quality here, except what is connected with offices; and nothing is more common than to see the son of a minister of state engaged in the meanest servile employment. In ancient times, offices of honour, trust, or profit, were hereditary in families; but at present they are given away according to the will of the prince. When any person enters upon an office, instead of an oath of allegiance to the prince, one of their priests takes a cup of water, and pronounces certain dreadful imprecations if the person to whom it is given fails in his duty to the king; and this is done by every person who enters into the king's service; let him be of whatever religion he will. This is perhaps a much better way of administering oaths than in Europe, where men are obliged to swear to do something which they never intend to comply with.

It is an established rule in this kingdom, that no officer presume to come into his majesty's presence without leave. Nay, the great officers of state are not permitted to visit each other; but at weddings and funerals; and then they are obliged to speak aloud, and in the presence of a third person; to prevent all consultations that might lead to a conspiracy against the established laws of the kingdom.

Every person present, if he knows what may give offence, or create suspicion, is obliged to turn informer on pain of death. In all places spies are barefaced and encouraged, which may serve to shew, that there is more than one error in the administration of public affairs; for why employ spies where there is nothing to fear? Indeed there are several other errors committed by this government, some of which point out that the established laws are weak, and the reigning prince in a continual state of fear:

Thus we find, that a man is in danger of losing his life if he brings bad news to the king; and this practice is the more barbarous, in proportion to the means made use of. Thus, supposing a rebellion should break out in any part of the kingdom, or that a foreign enemy should invade them, it is necessary that the news should be communicated to the king; but if that news is not agreeable, then the messenger is instantly put to death. A man is no sooner charged with a crime, than he is considered as guilty; and all the people, even his own relations, abandon him as unworthy of their notice. This makes way for his condemnation; for when prejudices operate upon the minds of judges, it may be fairly inferred, that the channels of justice are corrupted. But still the common people in Siam, as well as under all arbitrary governments, are more happy than the great. They know little of the sovereign, and he knows as little of them; so that they live in peace, leaving the king to do with his courtiers as he pleases. Ambition leads to danger and slavery in Siam, as well as in other countries; and this seems to be the reason why so much encouragement is given to informers.

The magistrates are in some measure under the necessity of oppressing the people, for they have no salaries allowed them. This induces them to oppress the people. In every province the governor has the sole command both civil and military; and although others are joined with them in the commission, for the purpose of administering public justice; yet they are only consulted, and he may approve of or reject their advice as he pleases. Here a foundation is laid for the grossest system of the most horrid corruption. Bribes are given to the judge; and what man, who is in the least acquainted with human nature, does not know that man is such a composition of animal and intellectual faculties, that bribes will operate upon the

minds of those who have it in their power to administer justice in an infamous manner, without being called to any account?

The laws of Siam require the same unlimited obedience to parents as in China; and the children are in all respects subject to their jurisdiction. A more than ordinary reverence is paid to aged men; and when a person is found guilty of lying, he is immediately punished by bastinadoing on the feet. Theft is so very scandalous, that when a person is accused of it, none of his friends will appear in his behalf. They have no counsellors to plead for prisoners; but when any person is accused of a capital offence, his nearest relations are permitted to come into court, and speak in his behalf. The clerks take down the evidence in writing, and this is laid before the judge, who considers of it in what manner he pleases, his decision being absolute and definitive.

When other proofs are wanting, they have recourse to torture, and to several superstitious tricks and practices for discovering the truth, in all respects similar to those adopted by the Anglo-Saxons before the Norman conquest. The prosecutor, as well as the prisoner, is obliged to walk upon hot burning coals; and he that comes off unhurt, is adjudged to be in the right. Sometimes they put their hands into boiling oil, but they are such ingenious impostors, that they know how to elude the force of the heat.

Their proof by water is by diving, and he that remains longest under water is looked upon as innocent. Another kind of proof is by vomiting pills, which their priests administer with severe imprecations; and the person who keeps them on their stomach without vomiting, are considered as innocent. All these proofs are made in the presence of the magistrates, and before the people in open court. Appeals are frequently heard in the presence of the king; and when he considers the nature of the evidence as dubious, or any way inconsistent with his own passions, he frequently orders all the witnesses to be devoured by tygers. Here is another sort of trial, in all respects consistent with barbarous nations: thus if the tyger devours the person immediately, he is considered as guilty; but if the tyger does not approach the destined victim with so much avidity as is generally expected, then he is considered as innocent. It is amazing with what intrepidity these people will offer themselves to these kinds of proofs, even that of being torn to pieces by tygers; while at the same time, as Loubiere observes, they are the greatest cowards in the world, when they are called out to battle to oppose the enemies of their country. Pride and cowardice are so often connected, that we know not in what manner to separate them.

Sometimes criminals are ordered to be trampled to death by lions or elephants; but their punishments are, for the most part, adapted to the crimes. A smuggler is punished by pouring melted gold or silver down the throat; and the same punishment is inflicted on those who are guilty of usury. In cases of perjury the mouth is sewed up, so that the delinquent shall never afterwards be able to speak; and all other crimes are punished according to the laws of retaliation.

All the people in Siam are pagans, but, like the Chinese and Japanese, they have their convents both for men and women. Their cloisters are built round their churches; and every monk, and every nun, have their separate cells, most of which are built on small eminences, and raised upon bamboos. The nuns live in the same convent with the men; and as they are never admitted till they are of proper age, so there is no great reason to be afraid of any criminal conversation taking place.

In this respect they are far superior, in the nature of their institutions, to the convents among the Roman Catholics. The latter are so much attached to superstition, that they often force their children to embrace the reclusive way of living in cloisters; but at the same time this is laying a restraint upon natural desires, and counteracting human reason;

They believe the world to be eternal, and yet they hold that all human souls are immortal. This sentiment is not at all inconsistent with the notions entertained by some of the people who inhabit the eastern nations, but it has no foundation in truth. They are firmly of opinion that all those who live consistent with the principles of their religion, will rise again at the general resurrection, and go into a state of everlasting happiness. On the other hand, they believe, that the wicked will likewise rise, but that they will be condemned to eternal punishment. They have one notion which seems to have been from the most early ages entertained by the heathens, namely, that there will be in a future state a difference of rewards and punishments. When they bury their dead, they burn the deceased's goods on an eminence adjoining to the grave; and this unnecessary custom prevails in several other parts of the east; for such is the wretched notion these people have entertained of a future state of rewards and punishments, that they believe, that whatever favour they shew to the deceased, will be of great service to them in eternity.

In Siam, the people pray to the dead; but then it is only to their own relations; and this sentiment seems to arise from natural affection.

The whole face of this country is extremely beautiful; mountains, rivers, woods, gardens, lakes, and delightful inclosures, all conspire to lead the mind away in a sort of pleasing captivity; and in many respects the manners of the people are so gentle, that no stranger is in danger while he travels through their country. We may add farther, that if agriculture is not so much encouraged as it ought to be in the country, yet the fruits of the earth are in such plenty, that the people have all things in abundance. Nay, they enjoy plenty in such profusion, that even a seven years dearth would not deprive them of provisions. This excess however creates something of indolence, and the people neglect their duty to their families, in order to gratify their passions. The observations here made are not new, they have often been advanced before by some of the greatest writers in the world; but we may venture to affirm, that whenever effeminacy takes place in a nation, there is an end of every thing that deserves the name of magnanimity.

In their marriage ceremonies they differ but little from those who live in more eastern nations; nor indeed from the Chinese and the Japanese. When a man designs to marry his son into any family, he employs some women to propose it to the woman's relations; and if the proposal is accepted, a conjurer or magician is sent for, to calculate their nativities; for from these prognostications the people are weak enough to believe that they can obtain perfect knowledge of every thing that is to happen to them in life.

When the necromancers or magicians have delivered in their answers, the parents consider of it; and if they consent that the match should take place, then the bridegroom and bride are allowed to converse together two or three times. At the last of these visits the relations are present, and the bride's portion is paid down. Immediately after this the consummation of the marriage follows, and there is no farther ceremony whatever. The priests are not in the least permitted to have any thing to do with the solemnity, because marriage in this country is considered as a civil institution, as it ought to be in all nations in the universe.

The wedding is attended with mirth and feasting, as in other parts of the world, and persons are hired to dance to divert the company; but neither the married couple nor their relations partake in any part of the diversion. The entertainment is made at the house of the bride's father, where the bridegroom builds an apartment on purpose, which is soon completed according to their slight form of architecture. Polygamy is allowed among them; but every man is obliged to give the honour of wife to one of his women, all the rest being considered as slaves. This custom is very antient, and seems to be peculiar to the eastern nations;

nations, and, however unnatural it may appear in itself, yet it is consistent with the manners of the people from time immemorial. The paternal estates of the husband descend to the woman, who is called the chief or principal wife, for all the children of the others are reckoned as slaves. When the chief wife has no children, then the whole estate reverts to the crown; and the king, consistent with a barbarous notion which prevailed, of what was antiently called honour, sells the children of the slaves or concubines, unless they are very handsome, and then he takes the girls into his seraglio.

The Siamese women are remarkable for their fidelity to their husbands; and as for jealousy it scarcely ever is heard of amongst them. While their husbands are in the king's service, they work at home, and support their children by their common industry.

The husband is absolute in his family, and may sell all his wives and children except her who has the honour of being called the chief wife, and he must not dispose either of her or her children. There are several other things necessary to be attended to in this country, but they are so many that we cannot enumerate them all. Parents are answerable for the faults of their children; and such is the nature and force of filial duty, that if a son absconds, and his father is taken up for his crime, the son, as soon as he hears of it, comes and surrenders himself up to public justice. The women in this country enjoy a great number of privileges,

and are not under the same restrictions as in China. They are permitted to sit at their doors fronting the streets, and may talk with any person whatever. It is true, their private apartments are behind the house; but in this there is nothing at all remarkable, because it is the custom of the country, and their being permitted to converse with strangers, is a strong proof of the good sense of the people.

Their funeral ceremonies, bear a near resemblance to those of the Chinese, for as soon as a person dies, they put the body into a coffin, which is lacquered all over. The coffin is placed upon a bedstead or table, and it remains in that position till the preparations are made for the funeral. In the mean time they burn perfumes before the corpse, and set up lighted tapers. The priests range themselves round the corpse, and sing hymns every night from the time that the person dies till the time of his interment. For this service the talapoons, or priests, are rewarded with money, which is not at all to be wondered at, when we consider that there is but one church in the world where fees are not demanded. All their funerals are conducted with the utmost solemnity in the morning, and generally before the sun makes his appearance. Many superstitious ceremonies are used on these occasions; but still we may learn this much, that the outlines of truth are to be found even in Paganism. Wisdom is best known when contrasted with falsehood, and the love of truth can only take place when contrasted with error.

TRAVELS THROUGH THE PHILIPPINE ISLANDS AND SEVERAL OTHER ISLANDS IN THAT PART OF THE WORLD.

By FATHER AVERIL, LOUBIERE, &c. together with some further Accounts communicated to the Author.

IN the former part of this work, giving an account of the voyages of Magellan, the Portuguese adventurer, we related the manner in which these islands were first discovered by the Europeans, and here we shall proceed to point out what observations have been made by those who have travelled over the interior parts of the different islands. It is true, several of these islands are called by various names, some of which are general, others are particular. The Ladrões is the first general name, but at the same time that is the name of several islands. The most frequented of these is Guam, but the Spaniards have given it the name of Maria, or St. Mary, in honour of the Virgin Mary. It is about forty miles in length, but not above twelve in breadth. At a distance it appears flat and even, but no sooner had we landed on it (says Averil) than the whole face of it was apparently changed; for towards the east we found a vast number of rocks, rising up extremely high, and the ground continued in a descent to the west.

The soil is reddish and dry, but it produces a vast number of different sorts of fruits, and the cocoa-tree grows near the sea-side, in groves of about two miles in length. There is a large fruit grows here, about the size of a foot-ball, which the natives eat instead of bread, it being esteemed very delicious. The inside is white and soft, like the crum of a penny loaf, and there is neither stone nor seed in it, but only a pure substance like bread. It is in season eight months in the year, and during that time the natives eat no other sort of bread. They have good hogs in this island,

but, as in most other countries in that part of the world, their fish are not worth the catching.

The natives are of a tawny colour, with black hair, and thick lips; but their bodies are well shaped, and their limbs long and robust. They are far from being such savages as they have been represented by some erroneous writers; for to strangers, who happen to traverse the country, they shew all sort of respect. They are much subject to a disorder similar to what we call the leprosy, but in most other respects the country is pleasant and healthy. The rainy season continues from June to October, but the showers are not violent; and though they have dreadful thunders, yet few accidents happen from the lightning; and the people are so accustomed to the return of them, that they never mind them.

The natives are ingenious in building boats, and other small vessels, and they make them sharp at both ends. The bottom is of one piece like a canoe, which serves instead of a keel, and is about thirty feet in length. The under part is made round, but inclining to the shape of a wedge, and the upper part is almost flat. The seamen have such a dexterous way of managing them, that they will sail twenty miles in the space of one hour; so that they are of great service to people who are obliged to transact business, by keeping up a communication between a variety of different islands.

All the houses on the island are built of wood, and thatched with the leaves of palmetto; and the inhabitants

bitants live together in villages near the sea-shore on the west side of the island. They have Spanish priests among them to instruct them in the Christian religion, but it does not appear that they make many converts. On the contrary, we find that the heathens not relishing the doctrines of popery, entered into a conspiracy against the Spaniards, but being detected before they could execute their design, the governor ordered all their plantations to be destroyed; and so many of the inhabitants were put to death, that not above one hundred were left. Those remaining were easily converted to popery, for the Roman Catholics are never more assured of success, than when they make use of coercive means.

The Philippine islands are many in number; and some of them are so small, that they are not inhabited; others however, are more considerable, and some of them of very great importance. Their religious rites and ceremonies are the same as the Chinese, which is a proof that they were peopled from that extensive empire. Nor will any reasonable thinking person dispute the truth of this, when it is considered, that there is a continual intercourse kept up between the Chinese and them. Probably some people, driven by oppression from the more southern parts of China, first settled in these islands, and it was natural for them to bring along with them their religious ceremonies, their civil customs, and their private manners.

The first island that deserves our notice, is Mandanoe, being near two hundred miles in length, and nearly one hundred in breadth. Many of the inhabitants are Mahometans, but the greater part are Pagans, who worship the same idols as the Chinese. They carry on a considerable commerce with foreigners, particularly with the natives of Japan and China; for they have rich mines of gold ore, and vast quantities of bees-wax, which they exchange for cloaths and such other necessaries as they happen to be in want of. They have not a regular form of civil government, every tribe or district being under subjection to its own laws, and those are explained according to the wills and humours of their chiefs.

This island, although near the line, yet is refreshed with such delightful breezes from the sea, that the people are not subject to any inconveniencies from the heat. The winds blow easterly one part of the year, and westerly the other. Those from the east begin in October, and continue till the middle of November, and during the whole of this season there is no rain. In the month of May the wind begins to come about to the west; but does not blow roughly from that quarter till the middle of the next month, and then brings with it rain, storms of hail, thunder, and lightning.

At first the wind blows gently, so that there are some days elapse before they have any thing like hurricanes; but soon after these become more frequent, there being several of them in one day. At length they come on so thick, that the whole country is for a considerable time like an heap of ruins. The largest trees are torn up by the roots. The rivers overflow their banks and drown the flat country, and neither sun nor stars are seen for some weeks together. The worst weather is about the beginning of August, when it is cold and chilly. In September, both the wind and rain abate, and the air grows clear; but still there are thick fogs every morning till near noon; when the sun shines out. In October, the wind comes about to the east again, and blows fair till April, when the changes take place which we have already mentioned.

In the centre of this island there is a city of the same name, and it is pleasantly situated on the banks of a small river, near which are pleasant gardens and inclosures. Their houses, like those in Siam, are built on poles above twenty feet from the surface of the earth; which is the more necessary on account of the rainy seasons happening so frequently; for without these precautions their houses would be totally destroyed. They ascend their houses by means of a ladder; and though they have but one floor, yet that is divided into so many apartments, that the whole is very convenient. Their

buildings are very slight, being for the most part composed of split cane, or bamboo; and the roofs covered with palmetto leaves. The people keep their ducks and poultry under their roofs; so that the space below their houses is not altogether useless.

This island has its prince or sultan, whose palace stands upon near two hundred pillars; made of the trunks of great trees. It is much higher than the common buildings, and has great stairs to ascend to it. At the door of the first room of the palace, twenty pieces of ordnance are planted; and several of the gardens have guns also placed at the gates of the houses belonging to them. This they learned from the Spaniards; for before they discovered those places, the people were utterly ignorant of fire-arms.

Not far from the sultan's house, or palace, there is a building for the reception of ambassadors, where in general merchants assemble to hold their councils, and settle their affairs. The floor is neatly matted, because these people sit cross-legged, without making any use of chairs. The whole of this city is not above a mile in length, and in breadth much contracted; nor are there any of the buildings that merit a particular description. The harbour is not convenient, for there is not above ten feet of water at spring-tide; so that it is in a manner impossible for great ships to get into it.

The people are not destitute of mental faculties, and, when they think proper, they are very active; but for the most part they are lazy and thievish, and will not work, unless compelled to it by hunger. This part of their conduct is in some measure owing to the tyranny of the government; for their chiefs are so rapacious, that they devour all that the industrious have laid up for a subsistence; and it is well known, that when men are not permitted to enjoy the fruits of their labour, they will pay but little regard to industry. Under such circumstances the mind becomes depressed, and it appears to them unnecessary to spend time and labour to acquire what is to be torn from them by violence, without their consent.

The men have small limbs, strait bodies, little heads, and oval faces, with small black eyes. Their foreheads are flat, their noses short, their mouths high, their lips red and thin, their hair black; and they blacken their teeth, as in other parts of India. Their complexions are tawny, but of a brighter colour than many of their neighbours. They never cut their nails, so that they often appear like eagles claws. They are extremely haughty to strangers, and among themselves very much addicted to that mean selfish passion, revenge. In such cases they frequently murder in the dark those who have given them the most trifling provocation; and so weak are the laws, that the delinquents are seldom brought to justice.

The men wear a kind of linen frocks or shirts, which reaches down almost to their knees, and they have a pair of trowsers, but no stockings nor shoes. They wear a small turban on their heads, which they tie but once round; and the ends, which are fringed, hang down. The women have long hair, which they tie up in a roll on the hinder parts of their heads, so as to give a more graceful appearance than ordinary. Their faces are of a rounder form than the men's; and their complexions something better. Their features are just, except their noses, which are small and flat; so that they appear much better at a distance than when one approaches them in order to take a nearer inspection.

They wear a short frock or shift like the men, with the sleeves much larger than their arms, but so strait at the lower end, that they can hardly get their hands through; so that they sit in wrinkles on their wrists. They have also a short petticoat, or piece of cloth, wrapped once about their middle; but the better sort of people are clothed in silk and calico. The common people wear the cloth made of the plantain tree; but they do not wear any shoes or stockings, more than the men.

Their women are more light in their conduct than any others in the East Indies; for whenever a ship arrives, they go on board, and ask whether any of the seamen wants a companion, by which they mean, that they

they are ready to prostitute themselves. If he is favourably inclined, she takes her gallant along with her on shore, and conducts him to the best apartment in her house. There he is entertained with the best that the house can afford, but for this accommodation the host expects to be well paid. The men of quality are not in the least jealous of their wives, so that a sort of harmony takes place among them, to which many of the people in other eastern nations are strangers. The women wear rings on their fingers, and bracelets on their wrists of gold and silver; for it has been, from time immemorial, an invariable custom in those parts, for the women, as well as the men, to fancy that there is some merit in dress; and in vain gaudy ornaments.

The common people live mostly on rice, sago, and small fresh-water fish; but the richer sort regale themselves with buffalo beef and fowls, of which they have great plenty; they are, however, extremely nasty in their eating, for they neither use knives or forks. When the victuals is set before them, they take up a handful of the rice, and having squeezed the juice out of it, they put the rest into their mouths. In the same manner they take up the first joint of meat that comes with their hands, and having with their teeth torn off the flesh, they throw the bones on the floor. They always wash after their meals, and this is the reason why they keep always a large quantity of water in their houses.

In order to preserve their healths (which is very necessary, after eating in the manner we have described, in such a nasty way) they have common public baths, to which all those repair who are able to be at a small expence; those who cannot afford to go to the baths, wash themselves in the rivers or in the sea, and nothing is more common than to see both the men and the women assembled at the same time. Both men and women take great delight in swimming, and in this exercise they are brought up from their infancy; which is extremely necessary in those hot countries, because bathing and swimming prevent fluxes.

They have an art in this island of making a sort of liquor from rice, which, when drank in considerable quantities, is of a very intoxicating nature. When strangers visit this place, this liquor is set before them; and they, being in a manner unacquainted with the effects that it will have upon them, generally drink to excess, and, forgetting themselves, quarrel with the people, which often brings them into trouble. It is a constant rule with them never to drink out of the same cup with a stranger who is not of their religion, lest they should be defiled; and this practice, which is of great antiquity, may serve to point out that even the most barbarous nations in the universe have some notions concerning that purity which should make a distinction among men.

They have no instrumental music, but instead thereof they hire women to sing, dance, and perform a great number of diverting tricks, such as leaping high from the ground, and tumbling down on ropes, at which they are so dextrous, that when we see them, they nearly resemble pieces of machinery. They also introduce a man at these ceremonies or festivals, whose business is to act the part of a hero. This part he acts to some perfection, according to the taste of the people, for no sooner does he enter the room than he puts on a most dreadful furious look, and having given a stroke or two, strides across the stage with his lance in one hand, and a great broad sword in the other; and having traversed it several times in a menacing posture, he stamps, strikes his head, and throws his lance; after which he draws his sword, and slashes the air like a madman. Having, to the no small diversion of the people, subdued an opponent, another makes his appearance, who acts much the same part, for the whole of this ridiculous farce consists in neither less nor more than a sham-fight; and not only their generals and great men have their share in these entertainments, but even the sultan himself often becomes an actor.

In their diversions in the fields, they have very little worthy of notice. They hunt wild cows and buffaloes in the same manner as they do deer, or any other sort of venison, of all which they have great plenty. In their hunting amusements, they often take their wives along with them, which practice is inconsistent with that of any other part of the East Indies. As they have no dogs, they make inclosures of wood, into which the hunted creature runs; and this is one reason why their diversions are soon concluded, for no sooner is the animal lodged in the snare, than they kill him. In this practice there is nothing either manly or diverting, for manly diversions depend upon exercise, and none can be more proper for promoting so salutary a purpose as hunting; but theirs is altogether effeminate.

It is remarkable that they have vast crops of tobacco here, which is bought up by the Dutch; but as this does not seem to be peculiar to the country, so it is probable that the Spaniards brought the seeds of it from America; and planted them here. However, it is necessary to observe, that as there is plenty of tobacco in China and Japan, so it is not impossible but that these might likewise have been some here long before the Portuguese or Spaniards discovered those islands. This tobacco they sell very cheap to the Dutch, who carry it to other markets, and receive the profits arising from it.

The severity of the government, as has been already taken notice of, renders the poor subjects in some measure inactive, lazy and idle, and therefore they are thievish, laying hold of every thing that comes in their way; nor are their magistrates much better than the common people, for on the slightest pretence they will stop any merchant's goods; and it is very difficult for him to get them restored, and never without paying an exorbitant fine. In general, all the criminals are punished by martial law; and the mode is, to strip them naked and bind them to a tree, where they continue the whole day, exposed to the heat of the sun, and tormented by thousands of wasps, who almost sting them to death.

The seas and rivers near this island are so infested with worms, that unless great care is taken, they will destroy a ship in a very little time; and therefore the natives, whenever they come from sea, immediately hale up their ships upon dry land, in the same manner as they do their canoes and barges. These worms are chiefly in the bays, creeks, and mouths of rivers; or in some places near the shore; being seldom found far out at sea.

The inhabitants are quick-sighted enough to be jealous of the Dutch; and yet it does not appear that they make a proper use of their well-grounded suspicion. They have already beheld the Dutch enslaving some of the best islands in the East Indies, and, in a manner, engrossing the trade wholly to themselves; and yet they have still suffered them to carry on their commerce to insult them, and to reap the fruits of their industry.

It is necessary to make here one single remark concerning that uniformity and consistency of character which has distinguished the Dutch from all other people in the world, ever since they threw off the Spanish yoke.

The complaints they made against their sovereign Philip II. might, in some measure, be true, although we have good authority to assert that they have been much exaggerated. They complained of the hardships they suffered under a regal form of government; but no sooner did they establish a republic among themselves, than they exercised such cruelties as the Spaniards were strangers to. They are the most inhuman tyrants in the world; for, under the name and stale pretence of a republican government; founded on principles of liberty, they oppress all those whom they subject, and trample upon the most sacred rights of humanity. We have been the more explicit on this subject, because there are thousands, and ten thousands in the world, who read books without knowing what

he word Government means, nor what it was intended for. Government is neither less nor more than *Providence in a political scale*; or, in other words, it is Providence accommodated to the tempers, passions, circumstances and weaknesses of men. But to return to the subject.

This island, as well as several of those adjoining to it, is woody and mountainous, but has several pleasant, agreeable vallies; for though the hills are rocky, hard and stony, yet they produce vast quantities of large timber; and in some of the rocks are mines of gold. The vallies are watered with fine rivers and brooks, and clothed with a great variety of trees and plants, which are green, and flourish all the year. There is one thing however necessary to be attended to; namely, that those who are engaged in mercantile affairs, never trouble themselves to examine those curiosities in nature which point out the wisdom, power, goodness, and indeed all the other perfections of the divine attributes.

One of these trees is called by the natives the Libby, but by the Europeans the Sago Tree. These trees grow in woods by the river sides; and it is of these trees they make the sago, which the natives eat instead of bread four or five months in the year. When they have cut down the tree, and split it in the middle, they scrape out the pith, and beat it with a wooden pestle in a mortar, and then strain the juice through a cloth. While they are straining it through the cloth, they keep pouring water upon it, which carries all the substance of the pith through the cloth, leaving nothing but a thin husk behind. That which is strained through has a thin sediment, or settlement at the bottom, like mud; which, when the water is drawn from it, is made into cakes, and baked, and is very good bread.

They have plenty of rice in this place, and in the hilly country they plant yams, pumpkins, and potatoes. They have also melons, plantains, bananas, guavas, jacks, cocoa-nuts, and oranges. As for the plantain, it is of more service to the people than any thing which the country produces besides. It serves them on many occasions both for meat and drink; so great is the divine goodness in providing for poor mortals! The plantain tree is about ten feet high; and no sooner cut, than there are many young plants which spring up in its room. At its first springing out of the ground, it has two leaves; and when it is a foot high, it has two more between the first; but a little lower, and a short time afterwards, two others spring out, and so in proportion to the length. When it is about a month old, the body of the tree is as large as a man's arm, and the uppermost leaves are about a foot and a half long, and about a foot in breadth. As the tree grows higher, the leaves become more broad; and when it is full grown, these leaves are at least seven or eight feet broad. These extended leaves are of vast service in screening the people from the scorching rays of the sun in those hot climates; which instance of divine benevolence, found in many parts of the habitable world, has been taken notice of by the ingenious Mr. Waller, in his beautiful poem, intituled, *The Battle of the Summer Islands*:

“ O how I long my careless limbs to lay
 “ Under the plantain shade, and all the day
 “ Call upon Phœbus to assist each strain,
 “ Invoke the muses, and improve my vein!
 “ And whilst I sing, if gentle Love be by,
 “ That tunes my notes, and wind her strings so
 “ high,
 “ With the sweet sound of Sacharissa's name,
 “ I'd make the list'ning savages grow tame.”

When the tree is full grown, there springs out of the top a strong stem, harder than any other part of the body, about as thick and as long as a man's arm, and the fruit grows in clusters round it in a pod about six or seven inches long, and as big as an ordinary man's wrist. The body is soft and yellow when ripe, and the fruit resembles in shape a Bologna sausage. The pulp in the inside is sweet, and softer than butter,

and of nearly the same colour, melting in the mouth, and has no seed or stone in it. This fruit, however, cannot be cultivated; nor will it ever thrive, or come to a state of perfection, but in a rich soil. They often roast or boil it while it is green, and it serves them instead of bread. The English seamen, when they come here, make it into puddings, and it is much esteemed by them.

Ripe plantains are often dried in the sun, and then they are presented as sweetmeats, in the same manner as our confectionary. This fruit serves to support many thousands of families in the West Indies, as well as in these islands we are speaking of. When they make drink of it, they take the pulp of ten or a dozen plantains, and mash them in a tub, into which they pour two or three gallons of water, and in a few hours it ferments, and has a head like wort. Having stood about four hours longer, it is bottled up; but as it will never keep above twenty-four hours, so they are obliged to brew it every other day in the morning, proportioning the quantity to the demand they have for the consumption.

But the most remarkable circumstance concerning this tree is, that besides affording victuals for the use of the people, many of the poorer sort are clothed by it. All nature as it were, in every part of the world, conspires to fulfil the will of the Creator.

As the tree never bears fruit more than once, they cut it down close to the ground, and having gathered the fruit, the wood that incloses the pith is so thin, that when dried in the sun, the women divide it into small threads with their fingers, and make those threads into cloth. But it is stubborn while it is new, and soon wears out; and when it is wet, feels a little damp and flimsy. They make their pieces about seven yards long, the warp and woof being all of the same thickness and substance.

The banana tree is much like the plantain for shape and bigness, but the fruit is not half so large. It is luscious, and of a more delicate taste; and the liquor made of it is considered by the people as superior to that of any other in the country. We do not find any beasts of prey here, but there are vast numbers of insects, particularly scorpions, whose stings are in their tails, and who turn them up in a serpentine form to their backs. They have likewise another sort of insect called *centipes*, about four or five inches long, of a reddish colour on the back, and their bellies are white. They have a vast number of feet, and their bite is reckoned more dangerous than the sting of a scorpion. They are generally bred in the rotten parts of old houses; and it seldom happens that any person bit by them is ever cured, the venom of their sting being in all respects pernicious.

They have many fowls both tame and wild, but they do not pay much regard to them. The Chinese throw somewhat of a languor over the spirits of the people, which being nourished by the oppression of their governors, reduces them to what may with great propriety be called a state of political insanity. Not intitled to the protection of their property by human laws, nor guarded against the inroads made by tyranny, they sink into the most abject state, forgetting the dignity of their nature, and thinking it unnecessary to toil for what they are not likely to enjoy.

They speak different languages, but the principal is that called the Malayan, which is in some measure common throughout these islands. And here it may not be improper to observe, that the learned, pious, and admirable Mr. Boyle, from a compassionate regard to their eternal interest in another world, was at the expense of having the New Testament translated into their language, and copies were distributed among them. This might have been attended with the most beneficial consequences, as they have schools among them where the young ones are taught to read; but the intrigues of the jesuits, who wanted to establish their own religion, while they kept the people in a profound state of ignorance, frustrated the design, and rendered abortive the plan laid down by Mr. Boyle.

The

The inhabitants are utterly ignorant of arithmetic, or indeed of any way of keeping regular accounts, except by memory, than which nothing can be more uncertain or fallacious. It is for this reason that they employ such of the Chinese as happen to be among them, to settle their accounts with foreign merchants. They have no clocks, but in each of their temples they have a drum, which a man beats on at the end of every three hours, to mark the time of the day.

As for artists, they have but few, and these are for the most part goldsmiths, blacksmiths, and carpenters. They keep no shops, but are sought after at their own houses, and employed in the ordinary way by their customers. The blacksmiths are very good workmen, considering what sort of tools they have to make use of. Instead of using a pair of bellows like ours, they take the trunk of a tree, which they bore hollow like a pump; this they set upright on the ground, and on the top of it make their fire. Near the lower end of the trunk they bore a hole, in which they place a pipe, and through this the air is conveyed to the fire by a bunch of feathers fastened to the end of a stick; and their most usual fire is charcoal. They have neither vice nor anvil; but instead of the latter, use a flat stone, upon which they beat their iron till they bring it into the form and consistency which they intend.

In this manner they not only make common utensils, but likewise all sorts of iron-work for shipping tolerably well. Almost every man is a carpenter, from which circumstance we may naturally infer, that the art is rather in its infancy. They have no saws, but split the wood, and then smooth it with axes, or some other instruments of a similar nature. And although this requires great labour, yet they work very cheap, and the goodness of the plank thus hewed, having its grain preserved entire, makes some amends for their trouble.

The sultan or prince of the country is an absolute sovereign in his dominions, and yet he is extremely poor. His revenues arise from the imposts laid upon such goods as are exported from the country, but these duties are very trifling. But mock majesty can reign, although only as an object of ridicule. When he takes his pleasure upon the river, he has his women along with him, and there is an apartment in the middle of the barge large enough to contain fifty or sixty persons. This is built of split cane, or bamboo, about four feet high, with little windows in it, and the roof is neatly covered over with palmetto leaves. This apartment consists of three rooms, one for the prince himself, the floor and sides whereof are matted, and he has a carpet and pillow to sleep on. The next room is for his women, which is furnished much like the other; and the third is for the servants, who attend with all such necessaries as are wanted.

The sultan has one prime minister, to whom he commits all affairs of state, whether civil or military; and to him all strangers are obliged to apply when they want favours from the prince. It is common for the women to perform some sort of dramatic interludes, or rather farces, before this prime minister, in which they bestow upon them a large share of flattery; for most of their speeches consist of idle, vain, and fulsome declamations on his many virtuous qualities, the grandeur of his family, and his heroic conduct in the field. It is in a manner unnecessary to observe that this custom is of great antiquity; we read of it in the sacred scriptures, when the women sang before David, "Saul has killed his thousands, but David his ten thousands."

But to return to the sultan: his wars are generally with his own subjects, and these are such as live in the mountains, who are impatient of the restraint of civil government, and chuse rather to subsist by plunder. The weapons used by these mountaineers are, a sword and lance, with a short dagger which has two edges, with a hilt resembling a pitch-fork. They seldom come to a general engagement, but when the armies come near each other, they begin to throw up entrenchments and redoubts. In this manner they will

continue skirmishing with one another two or three months, and sometimes they proceed to such extremities, that whole parties are cut off at once.

Manila, the next island which engages our notice, is about four hundred miles in length, and about two hundred in breadth. It is divided into several provinces, some of which are under the Spanish government, but the others retain their antient laws and customs. The city of Manila is situated on a point of land made by a river, which springs from another called Bohia, and falls into the sea a little lower, where there is a spacious and convenient harbour; only the entrance to it is rather difficult, because of the rocks and shallows that are at the mouth of the bay.

The city is about two miles in circumference, surrounded with a good wall and ditch, and fortified with bastions and outworks; besides which there is a fort, which stands upon a point of land between the sea and the river, and commands the entrance of the harbour. As the Spaniards have built the greatest part of this town, so they have modelled the civil government according to the constitution of their own country, which is the same as used in most of the provinces of Spain. In this respect the Spaniards have shewn that they are destitute of political knowledge; for had they known any thing of the nature of civil government, they would have acted in the same manner as the Romans did when they conquered their country, namely, have governed subordinate provinces by their own laws and original institutions.

The principal buildings in the city of Manila are such as have been erected by the Spaniards, but they are not numerous. The citadel is large, but neither well built nor properly adorned within. The walls are black, and all the decorations are paltry. The roof is supported by twelve pillars, six on a side; and besides the high altar, there are twelve smaller ones, with the same number of chapels. Here are also several convents for monks and nuns; with chapels, and hospitals for the reception of the sick. The college of the jesuits is a very good structure, adorned with arches, and has several spacious apartments.

The streets are wide and handsome, having galleries running all along the fronts of their houses; but the frequent earthquakes have spoiled the regularity of the city; several fine houses and palaces having been ruined, and some of them totally overturned; for which reason they now build most of their houses with wood. In the suburbs there are several houses built for the reception of such of the Chinese as happen to visit the island; and most of these houses are on wooden pillars, raised about ten feet above the ground. In the mountains the people live under the shelter of great trees, or in little huts they make of the branches; and when they have eaten up all the fruits upon the stalks, they remove to another place, according to the nature of the season.

The air of this island has nothing prejudicial to the health of the natives, nor to strangers; for though the climate is hot, yet the refreshing breezes from the sea remove all the noxious qualities, and strengthen those parts of the human body which otherwise would be rendered inactive. One thing must not be omitted in this narrative, and that is, they are much afflicted with scorbutic humours, which arise from the sudden changes of the weather. For no sooner does the hot season end, than the rain, thunder, and lightning, succeed, which greatly discompose the human frame. Sometimes they are subject to earthquakes, and these are frequently attended with very fatal consequences.

Not long ago there was such a dreadful earthquake at Manila, that it levelled a whole mountain to the ground, together with a third part of the city; and no less than three thousand people were swallowed up in the ruins. Many other accounts might be mentioned, but the foregoing it is presumed will be sufficient; rather than dwell too long on a melancholy subject, which cannot be very agreeable to a generous mind. There are several burning mountains in these islands; and their operations are much the same as those taken notice of

by Pliny, when he describes *Ætna* and *Vesuvius*, which every one knows who is the least acquainted with history.

The inhabitants of the Philippine islands are not all of the same complexion; and probably this will be considered as a proof that they are not of the same original. But hence it is necessary to remark, that the climate has a different effect on the complexions of people; and probably if a white man should, or rather did go to settle in those countries, his children would, in the succession of a few generations, be just what we find the natives are there at present.

The natives who inhabit the sea coasts are much like the rest of the Indians in their manners; for they sit upon mats, and eat their victuals without either using knives or forks. Their usual food is rice boiled with fish, for they seldom taste flesh, but at their solemn festivals. The inhabitants of the mountains live chiefly on roots and fruits, and on the flesh of such wild beasts as they catch in hunting. Their desires are few, and their wants are easily satisfied. Their monkeys and baboons are of such a prodigious magnitude, that when any person offers to take them, they defend themselves by throwing stones at their assailants. When they can find no sort of food on the mountains, these creatures go down to the side of the shore, where there are vast numbers of crabs, lobsters, and oysters; and these they take by putting a small stone into the aperture, when the creatures lay themselves open to receive the refreshing heat of the sun in very sultry days.

In the whole of the Philippine islands there are about two hundred and fifty thousand inhabitants, subject to the Spaniards; and yet it does not appear these amount to more than one twelfth part of the inhabitants, including such as come from Japan and China. In antient times they had no temples, but they used to deposit their idols in caves; and there they went to worship them, and offer up sacrifices before them. This ceremony was in part performed by priests, and part by some young girls, who strike the victim with a spear, which being killed was cut in pieces; part of it being eaten, and the rest burnt before the idol.

When a person of rank dies, not only his relations, but even strangers are hired to come and mourn; and

in their songs they lament the departure of the deceased. The body being washed, and perfumed with sweet herbs, it is placed upon a table in the most common room of the house; and all sorts of meat and liquors are set before the corpse. After some few days are spent in these ridiculous ceremonies, the body is conveyed to the burying place of the family, and a second feast is made for the entertainment of those who attend the funeral. But the widow and children continue to fast for a considerable time, abstaining both from fish and flesh, and living only on rice and herbs. Some of them mourn in black, and others in white; and on such occasions they always shave their heads and eyebrows; as to those who die in defence of their country, sacrifices are offered in honour of their heroic actions.

At present these islands are in some measure subject to the Spaniards, and some of them to the Portuguese; but they are frequently seized on by every invader. The reason is, the Spaniards are extremely fond of draining all the riches they can from them, but they pay no regard to their interior protection. They leave but a few soldiers to defend them from foreign invaders, so that it frequently happens that they are taken by all those whose avarice leads them thither in quest of plunder. It was so in the last war between the French, Spaniards, and English, and perhaps will continue so, as long as the Spaniards are an indolent body of people. Their riches are undoubtedly a strong temptation to those who are destitute of principles of honesty; and yet it does not appear that the Europeans acquire many advantages from their avarice. It frequently happens that their ships are taken in their return home to Europe, so true is the old saying, "That what is got over the devil's back, is spent under his belly." The number of convents among them decrease gradually; for it is justly remarked of the Roman Catholic priests, that they are the most arrant fools in the world, by imagining that the heathens will pay any regard to their superstitions.

These considerations are of a very serious nature indeed, but we shall leave them, and proceed to give an account of the other parts of the East Indies, from the writings of persons of the most undoubted reputation for knowledge and veracity.

TRAVELS INTO THE EAST INDIES AND SEVERAL ASIATIC ISLANDS,

By Mr. HAMILTON, HERBERT, &c. &c.

IN order to obtain a proper knowledge of that part of the world commonly called the East Indies, we must attend to what has been said by learned men who have visited that part of the globe; and we shall, as near as possible, deliver it in their own words. And here it is necessary to observe, that in the continental part of Asia, commonly called the East Indies, there are several islands adjoining, besides those already described.

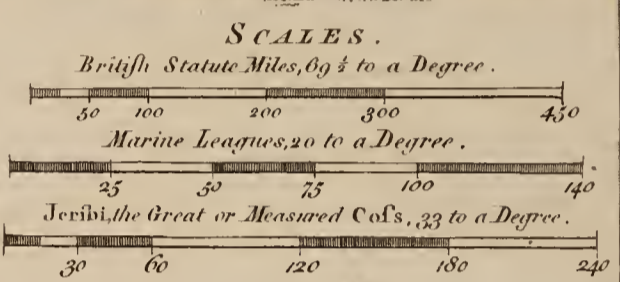

Those parts of the East Indies of which we are now to treat, consist of the dominions of the Great Mogul; but they are subdivided into a vast number of smaller sovereignties, all depending on him. "The province most to the westward, in the Mogul's dominions, (says Hamilton) is situated near the sea coast, and its chief town, or at least that which serves it as a mart, is Larribundar, which stands about six leagues from the sea, on a branch of the River Indus; the harbour being rather shallow, for it will not admit ships of a larger size than three hundred tons.

The whole town does not consist of above one hundred houses, so that it is little better than a village, and the houses are built of sticks covered with mud.

It has a large stone fort, with five or six guns mounted upon it, to protect the merchants, who trade to it, from the ravages of the borderers, who live mostly by pillage and thieving. Most of these robbers consist of outlaws, who having forfeited all right to expect any protection from the civil government, go out in large parties, and lay the inhabitants, who wish to live honestly, under contribution. They are in some measure screened from being brought to justice by their living partly in woods, and partly in marshy grounds. Nay, it frequently happens that those who are sent to chastise their insolence, join with them in their robberies, and all that these officers alledge in their own defence is, that the robbers are too numerous to be suppressed by them.

Tatta, the emporium of this province, is a large, populous, and flourishing city, being about three miles in length, and one mile and a half in breadth. It is about forty miles distant from Larribundar, and on the west it has a large citadel, capable of containing, without any inconvenience, upwards of fifty thousand men, both foot and horse.

The

BORNEO
This Inland Part is inhabited by the
BIAJAS a savage People.

NB. Pulo means Island
Sable Sand

The barracks are well contrived; there is fine stabling for the horses, and a spacious palace for the reception of the Nabob, who, though tributary to the Mogul, is considered as the supreme sovereign of the country. All goods and merchandize imported or exported between Tatta and Larribundar are transported on carriages drawn by camels, horses, or oxen. The country is almost level, and overgrown with shrubs and bushes, very fit to cover an ambuscade, which the robbers often make use of, by suddenly rushing out upon one part of the caravans while the guards are attempting to defend the other.

I once saw a caravan robbed by upwards of a thousand villains from the marshes and mountains; and the guard, consisting of about two hundred and fifty horse, was entirely cut off. At the same time above two hundred merchants were plundered of their most valuable effects, which struck such a panic into the minds of the people, that, for some time, they were afraid to enter upon any other expedition.

It was my fortune about four months afterwards to come to Larribundar, with a cargo worth about ten thousand pounds: I could find no merchants from Tatta who would purchase any of my goods, although they had no objection to the prices I fixed on them. Not knowing in what manner to dispose of my goods, I found myself under the necessity of going in a caravan, consisting of fifteen hundred beasts, and as many men and women, besides two hundred horsemen for a guard. This was about the middle of January, and after we had marched about sixteen miles, our scouts brought us news of the robbers being before us in great numbers. I had thirteen of my best seamen with me in the front, where my beasts were. We being all mounted on little horses, alighted and set our beasts on our flanks and front, to serve us for a barricade, to defend us from the sword and target-men, in which the principal strength of the robbers consisted, and we, at the same time, had room enough to fire over our barricade.

We were not long in that posture, when the enemy sent an herald on horseback, with his sword brandishing, and when he came within call of us, he threatened, that if we did not surrender at discretion, we should have no quarter shewn us. I had two seamen along with me, who were the best marksmen I ever knew; for I had seen them, while at sea, take aim at fowls, and shoot them at a considerable distance. I ordered one of them to knock down the herald, which he instantly did, by shooting a bullet through his head. Another herald immediately made his appearance with the same threatenings, and met with the same fate. When the third came, I ordered his horse to be shot in the head, to try if we could take the rider, to learn somewhat of the enemy's strength. The horse was killed as soon as he made his appearance, and some of our horsemen cut the rider in pieces, without bringing him to us, which was, in all respects, contrary to our instructions.

Our guard of horsemen had hitherto acted as arrant cowards, for they kept in the rear, till seeing what we had done in the front, they took courage, and getting in among the bushes, met with some of the enemy that had a design to attack our flank, and soon defeated them, which put the robbers into so much fear, that they fled away in the utmost confusion. Our horse pursuing them, put many to the sword; so that, when they returned from the pursuit, we continued on in our journey about four miles further, till we came to a mud-wall fort, called Dungham, which name seemed to us to have been given it by the English. It is built about mid-way between Tatta and Larribundar, to secure the caravans from being set upon in the night, who all lodge within it, men and beasts promiscuously, which makes it so nasty, that nothing but absolute necessity could induce any person to shelter in it. There are about twenty little cottages built close to the fort, where the people breed fowls, goats, and sheep, which they sell to passengers; and these are all the houses to be seen between Tatta and Larribundar.

When we arrived at Tatta, all the people of any considerable rank came out to meet us, and treated us with great respect; because we had defeated the robbers. They bestowed a thousand encomiums upon us for our courage, and treated us in the most hospitable manner; we were lodged in a large convenient house, in which were fifteen rooms, and we had very commodious warehouses. The stairs from the street were all of porphyry, ten feet long; of a bright yellow colour, and as smooth as glass. They were eight in number, and led up to a square of fifteen yards long, and about ten broad. The next day after our arrival we had a present sent us by the Nabob, of an ox, five sheep, as many goats, twenty fowls, fifty pigeons, with sweetmeats and fruits in abundance. He at that time lay encamped about six miles from Tatta, with an army of ten thousand men, with a design to punish the robbers who pillaged the caravans.

The Nabob sent for me, and desired to know when our company would drink a dish of coffee with him, and he would send carriages to bring us into the camp. I returned him thanks for his civility, telling him, that we would come next day to kiss his hand. Accordingly he sent twenty fine Persian horses, well equipped, for my use, ten of which I accepted of for myself and guard, and the other ten were mounted by some of the most considerable merchants in Tatta, who went to accompany me out of respect, and to make our cavalcade appear with more magnificent grace. As soon as we were come to the gate of the camp, we would have alighted; but an officer on horseback told us, it was the Nabob's pleasure that we should be brought to his tent on horseback; and he, riding before us, conducted us to the tent-door. As soon as we got from our horses, I was conducted to the Nabob's chamber, where I found him sitting alone; the rest that came with me were not permitted to come in for an hour afterwards. Many compliments passed between us, and I begged he would accept of some presents, which request he complied with; and I gave him a looking-glass, a fowling-piece, a pair of pistols, a sword, and some other articles. He then sent for all who had accompanied me into the room, and shewed them the presents I had made him; and, after some encomiums on my conduct and courage in defeating the robbers, told me that I was to be exempted from all taxes, either in importation or exportation. He added further, that if any of his subjects refused to pay for my goods, or any ways whatever attempted to injure me, I should have liberty to sell them, and their wives and children, as slaves. This privilege was of great service to me when the time for payment came; for the people were so much intimidated, that they paid me without the least seeming reluctance. I remained about three months in this place, and, during the whole of that time, was not only treated with respect, but even the Nabob himself sent every day to enquire concerning my health, and how his subjects had acted to me.

In this part of the country we found every vegetable production in the highest degree of perfection; and although we were not presented with a great variety of prospects, yet the rivers, the fields, the meadows and gardens, helped to variegate the scene, to relieve the mind from a continual repetition of objects, and display nature in her most amiable colours.

In travelling from Dungham towards Tatta, about four miles short of the city, on smooth rising ground, there are forty privileged tombs, which, from the plains, appeared like a small town. They were the burying places of some of the Nabobs of India, before it was subject to the Great Mogul. I went into the largest, which is in the form of a cupola; and in the middle of it stood a stone coffin, about three feet high, and seven feet long, with some others of a smaller size. The materials of the cupola were green and yellow porphyry, finely polished, and the stones set in regular order chequer-wise; which variation strikes the eye of the beholder with wonderful pleasure. The

tomb

tomb is about ten yards high, and seven in diameter. I was told it was the burying place of the last Nabob of that country, before it was robbed of its sovereign by Aurengzebe, in the beginning of the seventeenth century. The governor having taken the Nabob prisoner, bid him ask what favours he would have for his wives or children, and they should be granted. The captive Nabob replied, that all the favour he required was, that himself, his queen and children, might be buried in that tomb, which, in time of prosperity, he had built for that purpose; and this request the conqueror granted.

Tatta stands about two miles from the river Indus, in a spacious plain; and they have canals cut from the river that bring water to the city, and for the use of their gardens.

For three years before I came there, no rain had fallen, which caused a severe plague to affect the town and circumjacent country, to such a degree, that in the city alone above eighty thousand died of it, that manufactured silk and cotton; and above one-half of the city was left empty and deserted by its inhabitants. This was one reason why the Nabob had pitched his tent in the place where I went to visit him. At Tatta the river Indus is about a mile broad, and when I tried with a line and plummet, it was about six fathoms deep from the one side to the other. The stream is not very rapid, for its motion did not exceed two miles and a half an hour. It produces a great variety of fishes, and among them the best carp I ever tasted. Some of them weigh above twenty pounds, and they are often sold alive in the markets. They have black cattle in great plenty, large and good; and most excellent mutton, the sheep being from eighty to a hundred pounds weight. Their horses are small, but hardy and swift; and they have a vast number of wild creatures, particularly one called the shoe goose. It is about the size of a fox, with long pricked ears like a hare, and a face like a cat. The back and sides are grey, and the belly white. They are not common; for while I was there, I never saw more than one. When they are taken out to be housed, a horse carries the creature behind him hood-winked, and their deer and antelopes being pretty familiar, will not start before the horses come very near. He who carries the shoe-goose, takes off the hood, and shews it the game; which, with large swift springs, it soon overtakes, and leaping on their backs, and getting towards the shoulders, scratches their eyes out, and gives the hunters an easy prey. The leopard runs down his game, which often gives the hunters a long chase, as well as the dogs, who will take the water when the game betake themselves to swimming, which they frequently do. They have a fruit that grows in the fields and gardens, called *Salob*, about the size of a peach, without a stone. They dry it hard before they use it, and being beaten to powder, they drink it like tea and coffee, and sweeten it with sugar candy. They are of opinion that it is a great restorative to decayed animal spirits. There are great quantities of wheat and rice in this country, so that they never know what famine is. The River Indus overflows the country in the months of April, May, and June, and when the floods go off, they leave a fine slime on the surface of the ground, which they easily till before it becomes dry; and then, being sown and properly cultivated, produces a fine fruit.

Their cloth, called juncies, is very fine and soft, and lasts beyond any other cotton cloth I ever used. They make chintz very fine and cheap, and coverlids for beds very beautiful; they make fine cabinets, both lined and interlined with ivory. And the best bows and arrows are made of buffaloes horns. They export great quantities of butter, which they melt gently, and put up in jars made of the hides of cattle, almost in the shape of globes, with a niche and a mouth on one side.

The religion by law established is Mahometism, but a general toleration is granted for all others. Indeed there are above ten Pagans for one Mahometan,

and yet this city is famous for its numerous seats of learning. They have above twenty colleges for the training up of youth in all sorts of learning, according to the sentiments of the people in the country. I was very intimate with one of their teachers of theology, whom they call *seieds*, and he was reckoned to be a good historian. He asked me one day, if ever I had heard of Alexander the Great in my country? I answered, I had, and mentioned what I had read of his victory over Porus. He told me that their histories mentioned the same, but with some difference in the two kings names, and Alexander's passage over the Indus. He said, that Alexander was a magician, and by his art summoned above a million of wild geese, who swam his army over the river, and that Porus' would never turn their heads towards that place where Alexander's camp was fixed. From this I learned that the people of this part of India have some knowledge of antient history, though much obscured by fabulous tradition.

The Portuguese had formerly a church in the eastern part of the city, and the building is still entire. In the vestry are some old pictures of saints, and some holy vestments, which they proffered to sell, but I did not much chuse to purchase such merchandize. The Gentoos have a full toleration, and enjoy all the ceremonies of their religion in the same manner as when the sovereignty was in the hands of their own princes. They burn the bodies of their deceased relations, and sometimes the women burn themselves along with their husbands; but this they are not permitted to do, unless the great Mogul grants them his licence for that purpose.

There is a very great consumption of elephants teeth; for it is the fashion for ladies to wear rings of ivory from their arm-pits to their elbows, and from their elbows to their wrists, on both arms; and when they die, those ornaments are buried along with them. They had several feasts while I was there; but one, which they kept on seeing the new moon in February, was attended with many ridiculous ceremonies. This is called the Feast of Wooly, who was in antient times a kind of knight-errant among them. He was a bold fellow in war with some giants, who had for a long time infested Sindy, and carried away boys and girls who were disobedient to their parents, and eat them up as butchers meat. This Wooly, they told me, killed fifty of them one day in battle, each of them as tall as a tree; and after he had dispatched them, he led them down to hell, and there they are continually bound up, lest they should break loose and disturb those who are in peace in the world. In this mad feast, people of all ages and sexes dance through the streets, preceded by every sort of vulgar music; and the women, from baskets on their heads, distribute sweetmeats among them.

The men are bedaubed all over with red earth, or vermilion; but in the whole of their behaviour are so slovenly, that they often descend to such indecent actions as ought not to be mentioned. This scene of madness continues for several days, and it frequently happens much mischief ensues.

The river of Sindy would be hard to be found, were it not for the tomb of a Mahometan saint, who has a high tower built over him, called Sindy Tower, and it is always kept white, to serve as a land-mark. The bar going into the river is narrow, and has not above two fathom and a half at spring-tides; but then it must be remembered that this is only a branch of the Indus, and not the body of the river, which, at or near this place, is so much divided, that it is difficult to find out the general stream. We have been the more explicit concerning this province, because I never heard a proper description of it till I went to India; and therefore I shall go on to mention other provinces, equally as little known.

The next province we visited was Guzarat, which is formed into an island by a branch of the Indus, that runs into the sea, near the city of Gamboa. The inhabitants of this country, like many others in the

the East Indies, are rather nominal than real vassals to the Great Mogul. They are all Pagans, and live by committing robberies both by land and sea; nor can the Mogul totally restrain them, for there are so many inlets of the sea, that armies cannot march but with great difficulty from one place to another, and in many places there is no travelling but in small boats. On the south of the Indus we arrived at the town of Catchnaggen, where some commerce is carried on in cotton, coarse cloths, and chonk, a shell fish in the shape of a perriwinkle, but as large as an ordinary man's thigh. These shells are sawed into rings, which the women wear upon their arms; and these rings are fashionable in many other parts of India.

It is very remarkable, that the whole of this province is under the government of a queen, who is considered as very formidable to the neighbouring states. The reason they assign for chusing queens to govern the province is, that they will be more easily advised by their council than men. This notion is somewhat strange, for women are not so easily persuaded as these people may be apt to imagine. But the truth is, they elect a woman for their sovereign, that they may not be controuled in their actions, as would certainly be the case, were they under the government of a spirited prince. The inhabitants of this country are considered as more ferocious than those in some other parts of India, but they are at the same time more civil. It is true, they commit many robberies, but these are trifling, when compared with what we are now going to relate.

The next province we visited, was Sangania, which is likewise governed by a princess, and their sea-port, called Baet, has some good buildings, with a very commodious harbour. All criminals are protected here, so that few besides vagabonds are to be found. I had several engagements with them, for they attack all ships that come near the shore. Before they engage, they drink bang, a liquor distilled from hemp-seed, that has an intoxicating quality; and whilst it operates on their brains, they are extremely furious. They wear long hair loose over their shoulders; and in all engagements they never give quarter to prisoners.

A few years before I went to India, a small ship that mounted eight guns, was manned by three hundred men, all furious fellows, who had committed the most horrid crimes, and fled to this island for protection. The vessel had cruised several days between Surat and Bombay, and meeting with an English man of war, mounting forty-four guns, they made towards her, and engaged her; but they endeavoured to sheer off when they found their mistake. The English man of war sent out boats well manned, to try if they could take them prisoners, having no instructions to kill them. But they refused quarter, and killed and wounded many of the English; so that Captain Tyrrell, who commanded the man of war, was obliged to sink them. After their ship was sunk, and several of the miscreants, who were swimming on the surface of the water, refused quarter, and only seventy were taken. The late Lord Torrington was at that time a lieutenant on board the English ship, and received a dangerous wound in the engagement.

In 1717, they attacked an English ship, called the Morning Star, in her passage between Gambroon and Surat. She was richly laden, which they were apprised of, but they were defeated with dreadful slaughter, after having set the Morning Star on fire in two different places. We were often in danger of being robbed, while we staid in this province, but Providence was so kind to us, that we escaped with very little loss.

The next sea port we visited, was Jigat, situated on a point of land known by the same name. It makes a fine appearance at a distance, there being no less than five temples, and all these have high steeples according to the eastern fashion. The Great Mogul has a governor continually here, but the trade is fo

insignificant, that few strangers visit it. Here we purchased some cotton and a few other articles, which were reasonable enough, and we afterwards disposed of them to considerable advantage. Almost all the men in this province are employed in the armies of the Great Mogul, and they go from one regiment to another, just as it suits them; for they receive no pay, but what they can procure in the way of plunder. They seldom give or take quarter; and when they go on an expedition, they take their wives and children along with them, crowded up in carts and in waggons; and when their husbands are repulsed in an engagement, the women will not cohabit with them till they have performed some great exploit in order to regain their lost honour.

Near to this province is Diu, a small island. It has a town of the same name, which formerly belonged to the Portuguese, but at present is subject to the Mogul. The town is fortified by a high stone wall, with bastions at considerable distances, well furnished with cannon, and a deep moat hewn out of the solid rock, to defend it on the land side, which is about one third of the circumference of the city. The other parts are fortified by nature, having dangerous rocks and high cliffs towards the shore; and on the east side is a rapid river, the mouth of which forms the harbour. The harbour is secured by two castles, one of which is so large, that it can bring above a hundred cannon to play upon an enemy, and the other is used as a magazine, or store house.

It is one of the best built cities in India, and better fortified both by nature and art than most of them. All the buildings are of marble or freestone, bearing great marks of antiquity, which proves that it was formerly a grand city in that part of the world. At present, however, it is far from being populous, owing to the jesuits having given great offence to the government; and this is the reason why they are not permitted to preach there.

They have a tradition that the first Portuguese who settled here, circumvented the inhabitants in the same manner as Dido did the Africans when they gave her leave to build Carthage, by desiring no more ground than could be circumscribed by an ox's hide, which having obtained, they cut it into fine thongs of great length, and over-reached their donors in the measure of the ground. After the city was built and fortified in the manner already mentioned, it drew all the trade from the other ports belonging to the king of Guzarat, who is sovereign of the island; which made him repent of his generosity, so that he sent proposals to the Portuguese, to reimburse all the expences they had been at, if they would again restore the island to him; but he could not persuade them to agree to it. This induced him to raise a great army; but he was defeated, and the greatest part of his men either killed or taken prisoners.

This city, in the compass of half a century, arrived at such a state of grandeur, and acquired so much commerce, that it brought upon itself very potent enemies. The Turks had for some time formed a design of making a settlement in India, and accordingly they fitted out a fleet on the Red Sea, in which were no less than twenty-five thousand men. With this vast armament they sailed up the Straights of Babelmandel, and landed on the western part of this island. They laid siege to the city, and probably would have taken it, had not the Portuguese governor sent a reinforcement from Goa of twenty sail, some of which were large ships; and having on board heavy artillery, they battered the Turkish fleet, and drove them off; for which the basha, who commanded, had his head struck off when he returned home. But still the Portuguese had other enemies to deal with, their riches were tempting, and their priests were so earnest to make converts among the heathens, that they forgot the duty they owed to their own countrymen.

The Muskat Arabs landed here with a fleet without being discovered, and marched silently up to the town. They concealed themselves till day-light, when the

gates were set open; and then they marched into the place without meeting the least resistance. The alarm was soon spread over the town, and happy was he who got first to the gates of the castle; for all those who staid behind were massacred. The victorious Arabs plundered the city, and having loaded their vessels, fortified one of the churches, which the governor would have levelled to the ground, and probably destroyed all that were in it, but the jesuits would not suffer him.

And the reason why these mad priests acted in this manner was, because they were afraid that some shots from the castle might deface their sacred images. The Arabs, however, were not so scrupulous, for they made a bonfire not only of the images, but even of the host itself. This was most horrid to Roman Catholics; but surely those gods who cannot defend themselves, are not objects of worship. Here were many valuable things of gold and silver in the church, all which the Arabs melted down, and carried away; and, to add still more to the calamity, they burnt the priests books and robes, in honour of Mahomed their great prophet, whom they imagined gave them assistance in this enterprise. Some of the wooden images were exposed in the market-place; and I saw several whose heads, legs, and arms, were cut off: but the Arabs were so flushed with their success, that they neglected to take proper care of themselves; for it happened, that the governor having heard that they had given themselves up to all manner of debauchery and drunkenness, he proclaimed liberty to all such slaves as would fall out upon them. This had the desired success; for the slaves and soldiers, to the number of four thousand, sallied out, and killed a thousand of the Arabs, driving the rest out of the place.

All the country along the coast, for about one hundred miles, admits of no sort of commerce, most of the inhabitants being robbers, and are called Warnels. As they have but little inclination to cultivate the grounds, so they go out in great numbers, and attack strangers. When they attack a ship, every man has along with him as many stones as he can carry, and these they throw into the hold, in order to sink the vessel. If the seamen refuse to yield, they throw into the ship earthen vessels, filled with unquenched lime, and the pots breaking, there arises so great a dust, that it is difficult for the men on board either to breathe or see. They have also another method, and that is, to throw matches of cotton dipped in oil, and lighted, into the ship, and this generally sets fire to every thing in the hold.

They have no cities; and their villages are small, composed of mean huts. The best of these villages stands about eighty miles eastward of Diu, and is called Chance. It is built about a league within the mouth of a river; and opposite to it, about two miles in the sea, is a small island, which commands the mouth of the harbour. In 1716, the English attempted to burn this village, but they failed in their undertaking, and were obliged to retire with very considerable loss: for such is the strength of the place, that it is very difficult to get near it, unless by sending in many vessels, which contain a great number of men.

Goga, near the extremity of this coast, is a very pretty town, and besides several good buildings, has an earthen wall, and strong fortifications. These are the more necessary, because their neighbours often pay them a visit, in order to rob them of their most valuable effects. All the villages here are environed with thick hedges of bamboo; and the people are so numerous, that it would not be an easy matter to subdue them. All strangers are admitted to a free commerce, and the town is governed by an officer appointed by the great mogul, having under him a small guard of about two hundred men.

From Goga we proceeded twelve leagues farther to Cambay, near the bottom of a gulph of the same name. It has a river formed by one of the branches of the Indus, and the city has high, strong walls. It

was formerly the metropolis of a kingdom that bore the same name as the city; but Eckbar, the great grandfather of Aurengzebe, sent a great army against it, and annexed it to the Mogul dominions. It is still a considerable place of trade, but far from being well inhabited, although it is in a manner the source of riches to Surat, to which it is also subordinate.

The product and manufactures of Cambay are not inferior to any in India. They have plenty of rice, cotton, and cattle; and the inhabitants are very ingenious in making the most curious silks. Here are found vast numbers of precious stones, such as agates, cornelians, and several others. Of the cornelians they make rings for signets; and of agate, they make whole cabinets, except the sides. I have seen some fifteen inches long, and ten deep, valued from thirty to forty pounds sterling; but they were worth much more.

They also make bowls, spoons, daggers, knives, and buttons of the agate; with snuff-boxes of great value. They make exceeding fine carpets, some of which are brought to Europe; but the demand for them is not at present so great as it was formerly.

Adjoining to this province are several tribes of wild people, who, in their manners, have a striking resemblance to the Tartars. They are excellent marksmen; and so bold, that they pay no regard to the greatest dangers. They often plunder the people here; but whenever any thing of that nature happens, then their governors heads are cut off. In 1716, they were so outrageous, that the governor of Surat was obliged to raise an army of twenty thousand men to chastise them; but they laid so many ambuscades, that in two months this army was reduced to half the original number, and the rest were obliged to return home with disgrace.

The next place of note for commerce is Baroach, a walled town, standing on the banks of the river Nerdaba. It was formerly much more considerable than at present, because it suffered much about a century ago, in consequence of having, for a considerable time, resisted the whole force of the Moguls.

There are vast numbers of weavers in this town; and here it was that we purchased the best cottons we could meet with in India. Formerly both the English and Dutch had factories here; but now they have none; for as neither of these European companies could agree, so the people despised both, and drove them out of the country. This will always happen where men are led by motives of avarice, seek to trample on civil rights, and cheat others, whom in the end they frequently find to be as wise as themselves.

But the grand sea-port to be next attended to is Surat, which is built on the banks of the river Topta. Here some of the English settled about the middle of the last century; and the town increased to an amazing size; but no walls were built round it till some years afterwards. At last it was found in a manner absolutely necessary for the people to build a wall, which is composed of brick, and is both high and strong. At the same time the rich men in the place built themselves vast numbers of summer-houses in the middle of pleasant gardens near the city; for here, as in many parts of the east, the weather is extremely hot during the months of April, May, and June. But still this did not protect them from many insults from the robbers, who lived near them; so that however agreeable these country-houses might be, yet they were often obliged to leave them, and take refuge in the city.

In 1705, the circumjacent rajahs who did not chuse to live dependent, took all manner of advantages of the emperor Aurengzebe, who was then far advanced in years, and raised an army of eighty thousand men, in order to recover their antient privileges. They plundered the inhabitants of the neighbouring villages; but as they had no artillery, they could not do much harm to the public buildings.

And

and Travels.

A Diversion of
SWINGING,
practised by the principal people
IN INDIA.

And whilst this rabble of an army was before the town, the citizens built several breast-works, on which they mounted cannon, and built a wall, which reaches five miles in length. The inhabitants are computed to be about two hundred thousand in number, and amongst them are many very rich persons, both Mahometans and Heathens.

Abdoul Gafour, a Mahometan I was acquainted with, carried on a trade equal to that of the English East India company; for I have known him, in the course of one year, fit out above twenty sail of ships, and these were from three to eight hundred tuns in burden. Few of these ships had less property on board than ten thousand pounds; and some of them had twenty-five thousand pounds. When he died, he left his estate to two grandsons; but the Mogul finding they were rich, stripped them of the greatest part of their property.

The trade of Surat is still great; for, according to the revenues at the custom-house, it appears that the revenues paid the Great Mogul are in some measure superior to many of those which are paid to European princes. The posts in the Mogul's dominions go very swift; for the inns, or caravansaries, are not above ten miles distant from each other; and there are always men ready to conduct the letters from one stage to another. These letters are inclosed in a gilded box, which he that carries holds over his head when he comes near the stage, in order to give notice of his arrival. Here it is received by another; and as all these messengers travel at the rate of five or six miles an hour, advices are brought to court from the most distant parts of the empire, in the space of eight days.

In the city of Surat, all religions are tolerated; but that established by law is the Mahometan, but these are of the sect of Ali, which the Turks reckon to be hereticks. The difference between them is but trifling; but all trifles creates disputes, where religion makes part of the controversy. They live however on good terms together; for such is the prudent and respectable wisdom of the government, that men are not permitted to cut each others throats because they are of different opinions.

They have a yearly feast, but the time of its celebration is not fixed; for it varies every year according to a concurrence of circumstances, or rather because they are jealous of each other, and love to keep the knowledge of the diversions to themselves. The men withdraw into one room, and the women into another, each to attend to their devotions, which are peculiar to their sexes, and consistent with the customs of the country.

The women take each an handkerchief, or some such sign as may be known, and go in the dark promiscuously among the men, and, without speaking, lie down on carpets on the floor spread for that purpose. This abominable custom is now in some measure suppressed; for Aurengzebe prohibited their meetings under the most severe penalties.

The banyans are very numerous in this city, and consist of bankers and brokers, and all other sorts of persons connected with trade. They have many sects among them; and in general their worship consists more in form than sentiment. This is not at all to be wondered at, when we consider that all those who have either never known the truth, or having known it afterwards desert from it, generally lay hold of the shadow instead of the substance, and adore things useles in themselves, while they neglect to cultivate an acquaintance with such things as can promote their eternal happiness.

They celebrate their marriages here with great pomp, and rich presents are made to the people on these occasions. At night the bridegroom and bride are carried through the town with lighted torches before them, and music is played upon several instruments. Fire-works are let off as they pass along the streets, and the people send presents to their relations in honour of the marriage.

The fields about Surat are very plain, and the ground in general is fertile, except towards the sea, where it is sandy and barren. They have vast quantities of wheat, cattle, and all other necessaries of life; and fish are in such plenty, that they are sold at a very low price. They have plenty of wheat, as good as any in Europe; but they have neither oats nor barley. They have but few deer; but vast numbers of antelopes in their forests. They have no remarkable buildings in the city, only that their caravansaries, or inns are very convenient, most of them having a great number of rooms; and in these the merchants are accommodated with lodgings. The courts of law are not free from bribery and corruption, of which I have seen many instances; for the judge receives a fee of one fourth of the sum in litigation; and yet I have seen justice administered even to the most wretched.

The governor of the castle is not subordinate to the civil power, but he must not come out of his own bounds above once in the year. No person is permitted to cross the river after sun-set, nor dare any who come in boats put their foot on shore without permission. The duties on goods imported by the Mahometans, are two *per cent.* but the Christians pay three.

The Mahometan women go always veiled when they appear abroad, and their dress differs but little from the men's. Their coats, made in the form of shifts, are close bodied, and the men's are gathered in plaits below the navel to make them seem to be long waisted; and the women's are gathered above, to make their waists seem short. They both wear breeches reaching down to the ankles, and the men wear silver rings, which they use as signets. The women wear gold rings on their fingers, and sometimes on their thumbs, with small looking-glasses set in them, and they often wear gold rings in their noses and ears. The Heathens permit their women to appear without veils, and their legs are bare to the knees. They sometimes wear rings on their toes, and shackles on their legs, with glass-beads and some other trinkets hanging from them.

The men wear gold rings in their ears, and often three or four in one single cluster hanging at the lappet. When the English first settled in this country, they were greatly esteemed; but the Portuguese disputed the right with them, and having brought from Europe a large fleet of ships, gave at last a deadly blow to the English commerce. The Portuguese landed about three thousand men, and seized some goods belonging to the East India company. The English could not patiently bear the insults they daily suffered, and therefore it was resolved to land eight hundred men and attack the Portuguese, while they were lulled in security, from the confidence they placed in their superiority of numbers.

Accordingly by break of day the English were all landed, and every ship's crew led by their own commander. As they had conjectured, so it fell out, for the English attacked the Portuguese before they were in a posture of defence, and put them into confusion; the little English army pursued the Portuguese, and killed many of them in their flight; but at a point of land about three miles from the ships, the Portuguese made a stand and rallied, but the little victorious army made them take once more to their heels, and there was not above twenty of the English killed.

Some time after this I was on the field of battle, and saw many human skulls and bones lying above the ground. And the account of the battle I had from an old person who was born at a village called Tamkin, within two miles of the field, and he remembered every thing relating to the action.

And here we are under the necessity, in order to do justice to the public, of saying something concerning that great person whom we have often mentioned in the course of this work, namely Aurengzebe, who, in a great measure, laid the foundation of that glory which the Mogul Emperors now enjoy.

Cha Ishan, was one of the most politic princes that ever reigned in the east. He was a friend to the liberal arts and sciences, and gave great encouragement to foreigners to come to his court. He was sorry to see the most beautiful part of the creation, namely the fair sex, caged up in seraglios, bred up in ignorance, and left utterly unacquainted with useful employments. He formed a resolution to break those sordid chains, and grant the women those privileges to which they are entitled by nature; than which no sentiment could be more noble.

The first step he took, was, to order all the ladies at court to bring precious stones to a particular place in the market, which he had erected for that purpose. The ladies obeyed, and came to the booths appointed for them, and placed themselves in such a manner as to attract the notice of the spectators. On the market day, the king, and the rest of the nobility, came to the booths, and in the most complaisant manner asked what the ladies had got to dispose of? One of the ladies, more forward than the rest, told him, she had a fine tugi, a rough and valuable diamond, to dispose of. He desired to see it, and found it to be a piece of fine transparent sugar candy, and of a tolerable good diamond figure. He demanded to know what price she set on it? and she told him, with a pleasant air, that it was worth a lack of rupees, which amount in value to twelve thousand five hundred pounds. He ordered the money to be paid, and entering into discourse with her, found her wit was equal to her beauty, and ordered her to sup with him that night in his palace. She promised to obey, and accordingly went, and staid with him three days and nights, and then returned back to her husband, who was commander of five thousand horse. The husband received her very coldly, and told her that he would continue civil to her, but would never for the future cohabit with her. Upon which she went back to the palace, and desired to be admitted to the king, and being introduced, told what her husband had said. The king, in a rage, commanded the husband to be taken into the place where the elephants were kept, where he was to be trodden to death. The poor man was soon apprehended, and had his cloaths taken off, according to the custom of the country when they execute criminals. Being led out with his hands tied before him, on his passing near the palace, he begged to be permitted to speak with the king, and then he was willing to die in peace, if his majesty thought fit that he should die. A friend of his, who was an officer of the guards, got him admitted into the court of the palace, where the king might hear what he had to say.

He told the king, that what he had said and done to his wife, was the highest honour he could do the king; who, after he had honoured his wife with his embraces, thought himself unworthy ever after to cohabit with her. The king, pausing a little, ordered him to be unbound, where, as soon as he came, his majesty embraced him, and ordered him to be dressed in a royal habit, and gave him the command of five thousand horse. The woman was taken into the seraglio, and, in consequence of this connection, the famous Aurengzebe was born about nine months afterwards. Aurengzebe was brought up by his mother till he was twelve years of age, and then he had priests and philosophers to instruct him.

Cha Ishan finding himself advanced in years, resolved to divide his dominions among his sons, which he did; but this was not attended with any good effect, for they soon quarrelled among themselves. Agur, the province give to Aurengzebe, was one of the best, which induced his brothers to hate him. They marched their forces against him, but he raised an army to oppose them, under pretence of keeping the peace in his own province. Having defeated and put to death two of his brothers, he soon got the army on his side. He was then proclaimed emperor, and reigned in great splendour many years. He made vast improvements in buildings, and gave every sort

of encouragement to learning. He founded schools throughout every part of his dominions; and much of his reign being spent in peace, he died in an advanced age, and lies buried in a small tomb near the road leading to the city of Agur, where all the princes generally resided.

From Surat, for upwards of sixty miles, leading towards a town called Damaon, formerly belonging to the Portuguese, there are vast numbers of small agreeable villages under the government of Surat. In these villages the people are very industrious, and some of them remarkably ingenious. They make great quantities of earthen goods; but their silk is not much esteemed, owing to the little encouragement given them; for the government imposes heavy taxes, that nothing less than necessity could induce the people to do any work at all.

Damaon stands at the mouth of a river near the sea shore, and is naturally strong by reason of a deep marsh that almost surrounds it. The town is about half a mile in breadth, surrounded by a strong stone wall. All the houses are built of stone, and at one corner of the town is a very strong castle.

There are several merchants that come annually here from some of the other provinces, but the trade is much on the decay.

Travelling sixty miles more from Damaon, we came to Bassaires, a fortified city; but although it was in much esteem in former times, yet at present it is but little regarded, on account of the trade having declined.

Near this place is Telrek, an island of considerable size, being upwards of twenty miles long; and in it are many strange figures cut on the rocks, but at present it is not inhabited by any creatures but wild beasts and birds. When the Portuguese had the greatest part of the trade in the East Indies, they built several churches there, which are also gone to decay. These were sometimes very troublesome to the English, particularly in 1720; but a few bombs having been fired into Bandara, and two or three priests killed, together with about twenty of the inhabitants, they were glad to desist. Some years before this, a band of Arabs invaded the Portuguese settlements here; and having learnt that the priests were their greatest enemies, by telling the people they were heathens, they caused all they could lay hold of to be massacred. They likewise carried into captivity about fourteen hundred of the inhabitants, who were never afterwards redeemed. Thus the crown of Portugal lost much by the imprudent and indiscreet zeal of their priests, who, because others differ from them concerning religion, are constantly representing such persons as unworthy to live.

We came next to Bombay, an island formerly belonging to the Portuguese, but given up to the English in 1662, when Charles II. married the princess Katharine, daughter of the king of Portugal. It is not fertile, and the water is very unhealthy. Nor is the air much better, which is chiefly imputed to their dunging the coarse grounds with a sort of small fishes called buckshoas. These fishes, being laid at the roots of the trees, putrify, and cause a most disagreeable smell. In the morning there is generally seen a thick fog among these trees, that affects both the brains and lungs of Europeans, and produces consumptions, with many other diseases.

After the marriage, king Charles sent four ships to take possession of it, and the king of Portugal sent a viceroy to deliver it up.

This small fleet arrived in the month of September 1663, but the priests stirred up the people against the English, so that they were obliged to land their men at Swallay, a place belonging to the king of Surat. The English suffered much on this occasion, but a treaty being entered into, it was agreed that the Portuguese should exercise their religion with all their antient privileges of a civil nature; but this treaty occasioned much contention.

Mr. Cooke, the English governor, having taken possession of the island, began to build a fort. From that time the trade began to flourish, but the revenues coming to the king of England from the possessors of the island being rather small, he made it over to the East India Company. Five thousand pounds were delivered for building a church, but Sir John Child having been sent over as governor, converted the money to his own use, and nothing more was ever heard of it. Mr. Boone, a generous partizan, in 1715, began the new church, and in five years completed the whole building at his own expence. Before his time the governor reigned as an arbitrary tyrant, his will being law; but this gentleman formed a council, wherein matters were debated at large, every one being at liberty to give his opinion. But this did not last long, for Sir John having been elected chairman to the company, he abolished the council. Indeed, when we consider what a princely estate was acquired by Sir John, we need not be surpris'd that he must have acted in a very arbitrary manner, for riches are seldom acquired justly in such a rapid manner. It was likewise remarkable of this gentleman, that he propos'd a plan for the encouragement of the poor, which was, that they should all be transported to the colonies. Mr. Hanway has animadverted with great justice and accuracy on this plan of Sir John's, reprobating it as the most horrid that can be thought of.

Mr. Ward, brother-in-law to Sir John Child, was kept some time as deputy governor of Bombay, and he drove every thing into confusion. He went so far, as to deprive the military of great part of their pay, which induced them to contrive means to bring about a revolution. Accordingly they took him and general Child, who commanded the forces, both prisoners, and sent them, with all the members of their faction, to Surat. They then took the government upon themselves, and chose captain Thorberry governor.

General Child sent a letter to England, giving an account of the rebellion; and a frigate was dispatched to India, commanding the revolted to deliver up the island, offering a free pardon to all those concerned in the plot. Accordingly articles were drawn up, and the captain who had commanded the revolting forces took his passage on board a ship bound for England; but Thorberry being a married man, with a family, and an estate in the island, rather chose to remain there, which was one of the most imprudent steps he could have taken, especially as he was putting himself in the power of his enemies.

Child having by these means got the government again into his own hands, acted in a more arbitrary manner than ever, for he established a court of inquisition under the direction of one Geary, a Greek; and captain Thorberry was the first who felt the weight of Mr. Child's resentment. He got several fellows to swear him out of his estates, by bringing in forged bonds for sums of money borrowed from one King, whom he never had any dealings with. But even his estates did not satisfy the cruel governor, who ordered him to be thrown into prison; and even refused to admit his wife to speak with him. This hard usage brought on a violent fever, of which he died, leaving his wife and two children destitute.

The poor lady was permitted to visit him a little before he expired; but she was not suffered to be alone with him. On her return home to her family, she found her servants and children removed into a little out-house, and the doors of her own locked up. She had two sisters married in the island, and she hoped to find relief from them, and went to the eldest, who met her at the door, and told her, she could not admit her into the house, otherwise her husband's life would be in danger; and she believed it would be the same with the husband of the other sister, the governor having threatened both.

The poor lady, full of sorrow and grief, being abandoned by all her friends and relations, went back to her distressed family, and having no visible means whereby she could support herself, resolv'd to put

an end to her own life. But her sisters, unknown to their husbands, sent her some relief by a trusty servant in the night, with a letter, which they desired her to burn as soon as she had read. They promised to assist her from time to time; but although many gentlemen respected her, yet they durst not make their addresses to her. Mr. Luita, captain of an Indiaman, married her, concluding he could not be in any danger, because he was not subject to the English.

But that was considered as a very capital crime by Child, who told the merchants by whom the captain was employed, that if they did not discharge him from their service, they should feel the weight of his displeasure. Accordingly he was discharged, and died soon after of a broken heart, leaving his widow with another child, and about one thousand pounds in money. Many other oppressions were inflicted on the people by this rapacious governor; but some of a more humane disposition succeeding him, the affairs of the company began to flourish, and gradually rose to their present state of grandeur. There are many other particulars relating to this part of India, but we shall pass them over, to give an account of Goa, and the dominions belonging to it.

The city of Goa is built on an island about twelve miles long, and six broad. It is situated on the banks of a river, but the air is not reckoned wholesome. Here the Portuguese built many churches, but since their trade in that part of the world has declined, they are fallen to decay. Between Goa and Salfet there is a little river, the mouth of which has an excellent harbour. Here grow vast quantities of fruit, and there are plenty of all sorts of provisions. Cape Ramus is a frontier town belonging to the rajah of Sundah, and there is a strong castle, with a good harbour for shipping.

About twenty miles to the eastward of Cape Ramus, is Carwar, where there is a good harbour, capable of receiving ships of great burden. The rajah was formerly a free independent sovereign, but at present he is subject to the Great Mogul. The country is very mountainous, and lies on the sides of the mountains of Gatti. The vallies abound with corn and pepper, the best in India; and in the woods and on the mountains are numbers of wild beasts, such as tygers, wolves, monkeys, wild boars, elks, and cattle of a prodigious size. I have seen a wild bull killed there, whose quarters weighed above twelve tons, besides the head, hide, and guts. I measured the horns, which were not long in proportion to the size of the beast; but at the roots they were twenty-three inches in circumference, and the marrow bones so thick, that I took out the marrow with an ordinary silver broth spoon. The flesh was not savory, nor did it take the salt; for no sooner was it salted, than it became dry, black, and hard.

This country is so famous for hunting, that two gentlemen of distinction, the one Mr. Goring, and the other Mr. Lemborg, a German, both left Europe in order to be at those diversions. They did this unknown to their friends, but left letters directed to them, to be delivered three months after their departure. Letters of credit were sent after them the next year, desiring the gentlemen of the factory belonging to the East India Company to treat them according to their quality. They continued three years at Carwar, till at last, being tired with their diversion, embarked on board a ship for England, but Mr. Goring died on his passage home, and lies buried in the island of St. Mary, about four leagues from the shore.

There are three species of tygers in these woods, the smallest of which is the finest. It is not above two feet long when it walks, but is very cunning, and delights much in human flesh.

The second sort of these creatures is about three feet high, with a head like a hog's, but the body is of the shape of a deer. They hunt wild dogs, whose flesh they eat, but in most other countries they are very harmless. The greatest sized tygers are about three feet and a half high; they are less rapacious than

the others are much sooner frightened, nor do they eat human flesh unless driven to it by hunger. A poor peasant seeing a buffalo one day sticking in the mire, he went to a neighbour to get assistance to pull him out, but a tyger saved him the trouble, for he pulled the animal out by his own art and strength, after which, he threw him over his shoulder as a fox does a goose. In that position he was carrying it to his den; but when he saw the master coming, he dropped it and ran away, though not till he had killed it and sucked out the blood.

I once went into a wood to try if I could kill a deer, but a terrible shower of rain fell, which damaged my powder; and my gun being rendered useless for the present, I walked to the place where our factory stood. Turning into a foot way that led to the factory, I had not gone far when I spied a tyger of the largest size standing in the same path with his face towards me, I thought it would be in vain to turn back, so I walked up till I came near him, when he laid himself down on his belly and wagged his tail. I then clubbed my piece and made what noise I could in order to frighten him, upon which he ran in among the rushes, leaving me the road to myself. Passing on a little farther, I saw a wild bull and a cow grazing, the cow took no notice of me, but the bull seemed to be very angry; but I soon got out of his sight, and for the future never went into the woods again without a numerous company.

When the gentlemen of the factory are hunting, the wild beasts are so frightened at the noise of the fire arms, that they run away in great numbers, and many of them are generally killed. I saw at one of these hunting matches twelve deer killed, with two wild cows and their calves, besides a great number of wild hogs, and all in the space of two hours. The huntsmen made good cheer of what they had killed, and sent the rest to the factory. At that time there was a fine breed of English dogs in the factory, but they were soon after suffered to dwindle away.

The woods produce great quantities of a sort of timber called teak, which serves for building small vessels, and is used in most carpenters work; it is more durable than oak, and the masts made of it are very strong and hard. There is a shrub grows in the woods which has a leaf bigger than that of the fig-tree, and the dew that falls on the leaf being carefully gathered, and set in the sun two or three days, becomes the strongest and best acid I ever tasted.

When the Mogul's general took possession of this province for his master, he invited the gentlemen of the English factory to an entertainment in his tent, under pretence of settling affairs of commerce with the company; but while they were at dinner he sent a party who plundered and burnt their house, which obliged them to build and fortify another. The architect employed on this occasion was in all respects ignorant of the nature of his profession; for he did it in such a manner, that it was not capable to oppose a common enemy. And thus it happened that in the year 1718 the rajah built forts at the mouth of the river opposite to it; so that the factory was little better than a genteel prison.

Mr. Taylor, who was at that time chief of the factory, acted a very imprudent part; for a wreck having been driven on shore, he seized it, declaring himself the lord of the manor. The rajah could not bear to see himself so barefacedly insulted in his own dominions, by tenants that would hear no reason. He besieged the factory for two months before the season would admit of forces coming to our assistance; and when they came, it was found impossible for them to land in the face of an enemy who were ten times their number. Great numbers were cut off in attempting to land; but in about six weeks after we had some revenge on the enemy in an engagement on the side of a hill among thick bushes.

The enemy being on the rising ground above our men, began their attack at break of day, in order to drive us from a stream of fresh water near the sea; but

our small vessels lying near the shore, fired with such success, that in about an hour they were obliged to run, leaving two hundred dead behind them; and our men pursuing them, killed a great number more in the woods.

We being daily in expectation of more reinforcements, were therefore obliged to act rather on the defensive only; but we burnt several of their villages, and took some ships belonging to the rajah, which were coming from Arabia with horses, to the number of one hundred and forty. When our reinforcements arrived, we found that we had above twenty thousand men, but many of them were not trained to the use of arms. We landed without any opposition from the batteries of the enemy; for they were preparing to take shelter in the woods. But our officers were so long in drawing up their men, that the enemy reassumed fresh courage, and came towards us both with horse and foot, upon which our men were put into confusion, and above two hundred and fifty were killed. They were not however able to pursue us, and we found they had lost a great number of men; for we saw many fires lighted on the shore for them to burn their dead. Eighty of our sailors returned to the field of battle, and brought on board two hundred stand of arms.

The rajah, who by this time began to be tired of the war, sent one of his bramins on board to propose terms of peace to our commodore; and the commodore referred them to Mr. Taylor; but the bramin answered, that the rajah would by no means consent to treat with him; complaining that he was not only the occasion of the war, but that even before the war he had done several things to injure his subjects; all which was too true. However, the commodore agreed himself to the proposals; and in about ten days there was peace proclaimed between the rajah and the company.

There is one trick which the priests in this country put upon the people and it would puzzle the most ingenious merry-andrew in Europe to imitate it. About the beginning of June there is a feast celebrated in honour of the infernal gods, to find out by divination what crops the seasons will produce. The ceremony I saw here, and at several other places on the coast. Vast numbers of people assemble on a plain before a large stone of about five or six hundred pounds in weight; but it is not cut into any form like an image, only that it is daubed over with red lead and oil, and has a young girl to attend it. Before the stone is a fire, and the priests, almost naked, dance round it like so many madmen, for about an hour, distorting their features in the most frightful manner, and now and then bawling like calves.

This was the first scene, but the second was still more diverting to those who can laugh at the follies of their fellow-creatures. These priests had a scaffold erected on axle-trees, which had trunks fitted for them like the carriages of ships guns. The scaffold was about fifteen feet high, and nearly the same in breadth, with a notch; but in the upper end was like the pump of a ship, and holes bored through. A tree about forty feet in length was laid about the middle in the notch, and a bolt passing through the tree made it appear like a pump broke. At one end of the tree were placed two long pieces of wood, and another in the middle, each of the cross pieces at the end were about four feet long, and at the other end a rope was fastened, and this was the vehicle for the actors to hang on for upwards of two minutes.

These actors, who were four in number, presented themselves to the priest dressed in the most ridiculous manner, having crowns on their heads made of sugar canes, open at the end like ducal coronets. The priests brought two tenter hooks, such as the butchers in England use to hang their meat on, for each of the actors; and after some ridiculous ceremonies hooked them upon the back bone a little above the kidneys. Those hooks had cords fastened to them, so that they went dancing round the stone; and at the end of two or three

HUSBAND.

three minutes they came to the end of the tree, where the cross pieces were fixed, and one was tied up to each end of them. The mob laid hold of the other end, so that the foolish fellows were hung up above ten feet from the ground. The populace broke some old cocoa-nuts on the scaffold, and some hundreds of them got hold of the ropes fastened to it, and dragged it along above two miles over plowed ground; the young girl carrying a pot of fire on her head before them. When they came to the end of their journey, they were let down, and went into a grove, where was placed another stone pagod, before which the girl set her fire-pot, and ran about as if she had been stark mad for two or three minutes. She then fell into a swoon, and lay foaming at the mouth. When she was first seized with the fit, the people fell flat on the ground, as if they had been adoring her.

She continued in that state about a quarter of an hour, and then got up, seemingly very sick. The priest asked her many questions concerning what she had seen, and what she had heard from the terrestrial gods? Upon receiving her answers, they all bowed down, and then laid their hands upon a cow that was there ready, dedicated to the image; and then they departed home, as if they had been perfectly satisfied, for the people believed that the girl was inspired by one of their gods.

The greatest number of the inhabitants here are of the Gentoo religion, whose wives burn themselves, many instances of which I have seen; but these things are well known to all those who visit the East Indies. No man in this part of India is permitted to ride on elephants, mules, or horses, except the great officers of state, and the troops; for all foreigners and the common people are obliged to ride on oxen and buffaloes. Umbrellas are carried by their servants; for they must not carry them themselves; but in all other instances they enjoy as much liberty as they can wish for, if they did but make a proper use of it.

The next sea port to the south of Onar, is Batacola, situated on a river, about four miles from the sea, but it is now fallen to decay, there being little to be seen in it besides some mean houses, and the ruins of several temples. The country produces large quantities of pepper, and the English East India company had a factory here, which they lost in the following manner:

An English ship having arrived here with goods for the factory, they left behind them a fine bull-dog; and after the ship was gone, the factory, consisting of about eighteen persons, carried the bull-dog with them, in order to hunt wild beasts; but passing through a village, the dog killed a cow dedicated to an idol.

Upon this the priests raised a mob, who murdered the whole of the gentlemen belonging to the factory; but some of the natives of the place being friends to the English, made a large grave, and put them all in it. The chief of Corvar ordered a stone to be erected over the grave, with the following inscription cut upon it:

“This is the burial place of John Rest, with seven other Englishmen, who were sacrificed to the fury of a mad priesthood, and an enraged mob.”

Since that time the English have never settled here, but they go to it frequently to buy pepper. Near this place is the island of St. Mary, where Mr. Goring lies buried; and there are several other islands adjoining to it. A little to the south of Batacola is Barceloar, situated on the banks of a broad river, about four miles from the sea. The country abounds with rice, yielding in many places two crops in a year, occasioned by their having many lakes at the bottom of the mountains of Gaffi, whose waters are confined by sluices, and only let out at particular times, when found necessary for the rice fields. On the north is a castle, but it does not contain any thing worthy of notice, for although it was once strong, it is now fallen to decay.

About ten miles to the southward, is Bergura, a sea port, in the dominions of Ballamore, a formidable prince; and this country produces the best pepper, as well as vast quantities of cardamums. I once called at this port, and bought forty tons of cardamums for the Surat market. The prince sent me a present of some poultry, with other necessaries; and as the ship was very large, he intimated by his servants, that he would be glad to visit me on board. I sent him answer, that nothing could do me greater honour than a visit from him, and I sent my barge to wait on him. He came on board, and brought along with him about one hundred attendants in small boats of his own. I took him to the cabin, and would have treated him with coffee, tea, wine, or brandy, but he would not accept of any, alledging, that the water was polluted by our touching it. He desired to see every part of the inside of our ship, which I permitted him to do, and he spent about two hours in making observations. He said he would build such a one, but the water in his rivers was too shallow.

The predecessors of this prince have been lords of this part of the country many generations, and reigned with an absolute authority over their subjects. He had once engaged in a war with the Portuguese; for they had injured his subjects in some articles of commerce. In our conversation, I asked him if he was not afraid to venture his person on board our ship, seeing he was an enemy to all merchants whatever? He answered, he had heard of my character, and that made him fearless of any evil consequences. He said, he was not an enemy to trade; but he would maintain his sovereignty in his own dominions, nor would he suffer any foreigners to injure his subjects. Such words from the mouth of a heathen prince should put European princes to the blush.

He staid on board three hours, and at his going away I presented him with five yards of scarlet cloth, a fine carpet, a fowling-piece, and a pair of pistols richly mounted; which he seemed highly pleased with. He then took a manibar, or wrist jewel from his arm, on which was engraven something in their language and characters, and putting it on my left arm, declared me a free denizen in all his dominions; and his attendants paid their compliments to me with profound respect. At his going over the side, he gave the boatswain ten sequins for waiting on him while he was on board, and ten more for the seamen. And when my barge landed him, he gave the cockswain five sequins, and sent back as much poultry and fruit as she could carry.

He was a very well shaped man, about forty years of age, of a dark colour, but not quite black. His eyes were sparkling and lively, and he had something majestic in the whole of his deportment.

As soon as I conveniently could, I waited on him on shore, and he carried me to his palace, which was very meanly built of reeds, and covered with cocoa-nut leaves; but every thing was neat and clean. About fifty yards from the door of his palace, were two rows of beetle trees, very tall and straight, and under these he treated me with rice, fowls and fresh water fish, after the manner of the country. After dinner, he shewed me several warehouses built in the form of barns, filled with vast quantities of pepper and cardamums; and he told me, he wondered the English did not settle a factory in his dominions. I told him, that sending out his ships to land men at the European factories, had blasted the reputation of his country. He answered, that if the company would make a trial for only a few years, they would be convinced of his integrity and fair dealings; or if I would come and stay in his country, he would build a store-house at his own expence, and make a fortification round it, in any place that I should chuse, and that I should be superintendant of all the trade and commerce in his kingdom. I told him I could not accept of his offer without the approbation of our company, and that would require a considerable time. Some time afterwards, when I was at Cochin, I sent him

him word, that I designed to visit him; when he returned for answer, that I was a free-man in his country, and might come whenever I pleased, for I should receive a hearty welcome. About ten days afterwards I arrived at a small town in his territories, and no sooner did he hear of it, than he sent a person of distinction, with twenty armed men, to conduct me to his court. He had a stone house for the reception of ambassadors, in which I was lodged; but the bedding was only some mats laid on the floor. This, however, was no disparagement offered to me, because the prince himself has no better to lie on. Before I went into my lodgings, it was plentifully furnished with all sorts of necessary provisions, and a guard appointed to wait on me. Next morning he sent an invitation for me to come to his palace. I went accordingly, and was received with many protestations of his friendship; telling me at the same time, he would perform all he had promised before, if I would continue in his country. I staid seven days in his palace, and he treated me in the same manner as if I had been an ambassador; for every thing was provided for me, and the most honourable of his servants ordered to attend me.

When I went first to this palace, I was innocently guilty of what in this country is reckoned ill manners; for walking with him near his lodgings, I chanced to touch the thatch with my hat, which, in his opinion, polluted it so much, that when I went away he stripped the place of its covering; because religion forbid him to sleep under it. Had one of his own subjects been guilty of the same, they would have been in danger of losing their heads.

I received daily for my table six hares, two pounds of butter, twenty-five pounds of rice, a quarter of a pound of pepper, some beetle leaves, and green arrack, with twenty young and ten old cocoa nuts; but no fish, which was a favourite dish of mine. I sent my own servants to the fishermen when they came to shore; but the poor fellows dared not take any money; but they supplied me, and I took an opportunity of paying for them when the prince's servants were not in the way. When I took my leave, he seemed sorry to part with me; but as I was obliged to go, he ordered his servants to conduct me to the frontiers of the province.

The whole face of the country is finely diversified with lakes, rivers, hills, woods, orchards, and cultivated grounds, many of which are inclosed; and here are several delightful prospects to the sea, which are pleasing to a traveller.

The next place we visited was the Samorin country, reaching along the sea coasts from Ticori to Chitwa, about seventy miles in length; but not above one-half of that in breadth. The produce of this country is pepper in abundance; cocoa-nuts, beetle-nuts, and a sort of sugar; also oil, sandal-wood, and timber for ship-building. In former times the people had many strange customs here; one of which was, that the prince was not to reign longer than twelve years. If he died before the expiration of that time, it was very well; but if he survived it, he was obliged to cut his own throat on a public scaffold erected for that purpose. Previous to this, he made a grand entertainment, and after the feast he saluted the guests, mounted the scaffold, and performed the dreadful operation.

This barbarous custom is now laid aside; and instead of it, there is a jubilee celebrated at the end of every twelve years in a spacious open plain, and the prince is surrounded by guards; any person who can pass thro' those guards and kill him, obtains the government. When I was there, I saw one of these jubilees, at Penary, a sea port of theirs; and there were but three men present who would venture on the desperate act of killing the prince. These attempted to kill the guards, but were killed themselves; and the prince, so far as I could learn, reigned some years after.

The prince, when he marries, must not cohabit with his wife till the high priest has lain with her; for the first born child, if a son, must be dedicated to the god whom they worship. And some of the nobles are so complaisant, as to allow the lower people the same privilege with their wives, although they are not obliged

by law to do it. There is a strange sort of polygamy here; for instead of the men having more wives than one, the women may have twelve husbands; but they are not to exceed that number. This is no better than common prostitution; and therefore ever since they began to trade with the Europeans, the practice has been gradually going into decay.

The people were formerly prohibited from building houses, so that they were obliged to reside in the woods; but now they have huts, where they live, but they are poor miserable habitations.

They have a particular way of arresting a man for debt, which is done in the following manner. The judge sends a priest with a small stick in his hand, to the place where the debtor resides, and when he finds him, he draws a circle round him, commanding him, in the name of the prince and judge, not to stir out of it till the creditor is either paid, or security given for the payment; and it is death for the prisoner to go out of the circle till these terms are complied with. They write on leaves of trees, but they have no ink, for the characters are engraven with the point of an instrument like a bodkin.

The whole of the country is open to the sea; the soil is fertile, and the air is wholesome. Here are great numbers of small villages, but no towns of any note; even the palace where the prince resides is a poor miserable place.

Further along the coast are the dominions of the king of Cochin, one of the most romantic places we had ever seen. There are so many rivulets that run off the mountains, that they reckon above one thousand islands formed by the streams. The mountains are about twenty miles from the sea, and they all join together at Granganore, and make one great outlet to the sea; and another great outlet is near the city of Cochin.

The first Europeans who settled here were the Portuguese, who built several forts, and established a considerable trade, but at present they have no possessions there.

About two leagues more to the northward, on the side of the mountains, on the banks of a small river, is a place called Firdalgo, where the inhabitants of Cochin generally assemble to refresh themselves in the hot months of April and May. The banks and the bottom of the river are covered with clear sand; and the water so clear, that a person may see a small pebble at the bottom of three feet water. Every company makes choice of a place by the river side, where they pitch their tents, and hang up coverings, that the ladies may not see them bathe, and on these occasions the men shew their dexterity by several tricks.

Some part of the day they pass in games at cards, and at night every family sleep in their own tents, on soft clean sand, without mats. On the side of the river is a place called Hell's-mouth by the English. It is a subterraneous cave, about four yards broad, and three high, hewn out of the solid rock. I went into it with a lantern, and passed strait forward about two hundred yards, but saw no end to it. For what purpose so much labour was thrown away, cannot now be known; but probably it was a place for thieves to reside in. At present it is infested with snails and bats, who were frightened by the light of our candle and our noise; and as we were tired with their company, we returned back.

The water in this country is very pernicious; for it causes the peoples legs to swell, and I have sometimes seen some of them swelled up to a yard in circumference. It causes no pain except itching, nor does one swelled leg seem heavier to the patient than the other. The servants of the company send for their water from a neighbouring island, and so do the Dutch; and yet for all that, I have frequently seen both Dutch men and women with monstrous swelled legs; but seldom any of the English, who, whatever their characters be at home, endeavour to live here in a very moderate manner.

Ceylon, or Zeloan, is the next place we visited, and is an island famous for producing vast quantities of cinnamon, the bark of which is famous all over Europe;

Europe; besides the precious stones found in it, such as emeralds and sapphires. There are vast numbers of elephants here, and the manner they catch them is rather singular. They drive long stakes into the ground for two or three hundred paces in a plain, and at about one hundred paces distant they begin another row of stakes, so contrived as almost to meet the ends of the other rows, leaving only about seven or eight feet open, to serve for a sort of a door. Farther out from the door are some thick stakes driven into the ground, so as to form something like a chamber. In the door place is a trap door fitted, to pull up and let down at pleasure; and when all is prepared, they bring up a female elephant as a decoy, which is put into the chamber, and the trap-door kept open. There are men placed in a tent on the top of the stakes at the entrance of the trap door, and the female elephant makes a most hideous noise. If a male elephant is near, he immediately approaches the chamber on the outside, but finding no entrance there, he walks along till he finds the end; then walking back on the inside of the stakes, he finds the door, and enters. As soon as he is in, the watchmen let down the trap-door, and go and bring two tame elephants to decoy him to their stables. When the tame elephants come near the trap-door, they place themselves on each side, and if the wild one is surly, they bang him with their tusks, and the female bestows some blows on him at the same time. When he is tired with their punishment, and finds no other remedy but patience, he grows tame and walks very sociably between his guards, where-ever they chuse to lead him, and continues tame ever afterwards, except in rutting; when, if young, he becomes very troublesome. That time is known by a great sweating in his head, so that they have strong fetters to put upon his legs, and they fasten him to a strong tree eight or ten days, till his madness has subsided.

All along the coast of this island there are very steep rocks, but they yield pleasing prospects. The woods, inclosures, and orchards are delightful, and the rivers and lakes afford the most excellent fish. The people have a tradition, that Adam was created on this spot; and they still shew a place, called Adam's Bridge. And they believe that when Adam transgressed, the angels made this bridge for him to travel over to the continent.

As all the inhabitants of the island are gross idolaters, it will seem strange perhaps to some readers, that they should have a traditional account of these things; but then it ought to be remembered, that the account of the creation has in it something of such an universal nature, that there is scarcely in the world one savage nation who have not some vague, uncertain traditions concerning it. The island is divided into several provinces, and most of these are finely cultivated. Their temples are numerous, but few of their houses deserve any notice.

The island of St. Thomas, not far distant, was once in the possession of the Portuguese, but they lost it by the superstition of their priests, a set of men who have done more injury to commerce than all the tyrants who have ever yet lived in the world. They told the people, that St. Thomas preached the gospel in this island, and being once in want of fresh water, he cleft a solid rock, and was plentifully supplied with that useful article. The Heathens, however, did not believe them, for they (the priests) having pointed out a cave in the rock, which they said was the place, the inhabitants were confounded when they knew it was cut out in a natural way, not long before they came to the island.

Near this the English factory have many pleasant gardens, particularly those at fort St. George, with summer-houses, where ladies and gentlemen retire during the hot season.

Fort St. George, in Madras, is a city and colony belonging to the English East India company, situated in the most commodious manner. It fronts the sea, which runs continually against the shore, and more

so here than in any other place upon the coast of Coromandel. The fortification is on land, having an arm of the sea in the form of a river behind it, which obstructs all springs of fresh water from coming near the town. They are obliged to go above a mile distant for fresh water, and if the sea breezes did not cool and refresh the air, it would be impossible to live in the place. A fort was first built here about five years after the restoration of Charles II. during the time we were at war with the Dutch; it was erected with a view to protect our trade in that part of the world.

The soil about the city is so dry and sandy, that it bears no corn; and what fruits, roots, and herbage they have, is brought to maturity by great pains and much trouble. Had the English settled at Palicat, where the Dutch have settled since, it might have been of great advantage to them; for there the road is good for shipping, the river commodious, and the soil rich. Why they did not make choice of this place, cannot now be accounted for, but surely it must either have been for want of knowledge, or something worse.

However, the war carried on in Bengal and Bombay by the English, against the subjects of the Great Mogul, contributed at least to make Fort St. George a flourishing place; for the peaceable Indian merchants, who hate war, came flocking thither, because it lay far from those incumbrances of trade. Another motive was, it lies near the diamond mines of Golconda, where there are many tents, good bargains to be made, and money got by our governors. The black merchants resorting to our colony to secure their fortunes, and bringing their goods to a safe market, made it both populous and rich, notwithstanding its natural inconveniencies.

The town is divided into two parts, one of which, the Europeans call the White Town, because it is wholly inhabited by them. It is walled quite round, and has several bulwarks and bastions, which can only be attacked at the ends; the sea and river fortify its sides. It is about four hundred paces long, and one hundred and fifty in breadth, divided into several pretty regular streets. The distribution of justice is carried on in an arbitrary manner, and often both against law and reason; for the will of the judge, guided perhaps by the most servile passions, and bought over by the influence of money, turns the scale of equity, and induces a magistrate, whose conduct cannot be easily called in question, to acquit the guilty, and condemn the innocent, which is a disgrace to all governments whatever.

The black town is inhabited by Gentoos, and some other Indians, for there are so many tribes of them here, that they are not all readily distinguished; and all those of different religions have their own temples. It was walled in towards the land by Governor Pitt, because he was apprehensive that some of the Mogul's subjects in Golconda might one day plunder it. Great improvements were afterwards made in the fortifications, for the governor obliged the people to contribute towards the expence. The diamond mines are not above a week's journey from Fort St. George, which makes them very plentiful; and yet the Great Mogul, and his subordinate princes, the bashas, will not suffer any of the great stones to be brought to market, since that amazing large diamond was brought over to England by Governor Pitt. Mr. Glover, by whose means it was brought to the governor, declared, that he lost three thousand pagodas, by introducing the seller to Mr. Pitt, having left so much money at Arcot as a security, that if the stone was not justly bought and paid for at Fort St. George, the owner should have free liberty to carry it wherever he pleased, and dispose of it. But the governor cheated both the owner and Mr. Glover. Such are the effects of arbitrary unlimited power when vested in governors who are too far from home to be brought to public justice.

Happening once, on a certain occasion, to travel from Ganjam to Ballasore, I had an opportunity

of seeing many curious things in the country. About three miles to the eastward of Ganjam is Illunc, at the end of that ridge of mountains which divide the kingdom of Golconda from Orka. Its ruins run within pistol-shot of the sea, and there were several soldiers placed to demand a tax from every person who came from Orka. I had seventeen servants along with me to carry my baggage, and the whole of the tax amounted to about three shillings. Proceeding further, I came to Munikapatam, where there is a great inlet from the sea, but about a mile from its mouth it divides itself into many channels, which form a vast number of little islands.

The Mogul had an officer there, who examined from whence we came, and whither we were going; our answers were satisfactory, and he presented us with some poultry, rice, and butter, and gave us a place to lodge in. But although we saw plenty of fish in the rivers, yet we could not purchase them, because there is a small pagod on a hill where all sorts of fishes are worshipped; and water-fowls are so sacred, that they must not be killed. However great this superstition may appear in the eyes of those who live in more enlightened countries, yet we shall have occasion to relate some still more absurd.

Our next stage was at the famous temple of Jagarynah, which in clear weather may be seen from Munikapatam. In our way we saw vast numbers of deer and antelopes; so tame, that they would not move out of our way till we came within a few yards of them. Water wild fowl are likewise very numerous, but none dare kill them, under pain of excommunication, which cannot be removed any other way than by paying round sums of money to the priests.

Poultry is likewise in great plenty, but must not be killed by the Pagans, because they worship them; nor can strangers be permitted to purchase them. But the Mahometans who reside here make no ceremony of this canon law, but eat both them and fish; as we do in Europe. In the whole tract of land between Ganjam and Jagarynah, the god in most esteem is Gapalsarmi, whose temples are decorated with obscure representations of men and women in very indecent postures; and likewise of naked devils, one of whom is of a monstrous size. This filthy image is worshipped by the heathens of both sexes, but particularly by barren women, who are his greatest devotees, and these bring the richest offerings.

Vast numbers of pilgrims visit this temple from all parts of India, which brings considerable support to the priests. It stands in the middle of a plain, about a mile from the sea, but there are no mountains, rivers, nor inlets of the sea near it. It is built of hard free-stone; the pedestal of large square stones, and close by it is a cistern, built round with long square stones of different colours, viz. pink colour, sky-blue, grey and white. This famous temple is built in the shape of a canary pipe standing an end, about sixty yards high. About the middle is the figure of an ox, cut in one entire stone, bigger than a living one, with his face towards the east, and his hinder parts fixed in the wall. The fabrick is crowned with a top of the same diameter as it has in the middle, and makes no very contemptible appearance. On the west side of the temple is a large chapel that joins it, where sermons are preached every day; and there are some convents at a little distance, where the priests reside. There are in all about five hundred of them belonging to the temple, and they are of different orders and degrees, all under one chief or high priest. They boil vast quantities of rice every day for the use of the idol, but the reader will naturally imagine he does not eat any. I staid there one day and a night, and the house I lodged in was very near the temple. The priests spent the nights in beating on tabors and brass cymbals, with songs of praises to their idol. There are no windows in the temple to give light, so that one hundred lamps were kept continually burning. He

is railed about, so that none may approach him but the priests, and the lamps give the whole a most melancholy and frightful appearance. I was only permitted to go to the door while it was open; for although I offered the value of three pieces to be admitted, yet they would not permit me. However, I sent my servant, who was a Gentoo, and he having viewed every thing, brought me the foregoing account.

He is never removed into the temple, but his effigy is carried about in procession, mounted on a coach four stories high. It runs on eight or ten wheels, and can contain two hundred persons. It is drawn through a large street, about fifty yards wide, and two miles in length, by a large cable of fourteen inches in diameter. It requires two thousand men to draw it; and some old devotees, as it passes through the streets, fall flat on the ground to have the honour of being crushed to death by the wheels; and if they have the good fortune to be killed outright, the priests make the mob believe that the soul of the deceased is much in favour with the idol; but if he has only one or two of his limbs crushed to pieces, then the devotee is not sanctified enough to be taken notice of. However, if they die of their wounds, then they are honourably buried; and the priests tell the people that their souls go into everlasting happiness in paradise, without stopping at a house by the way, where some souls were obliged to be purified.

They have a tradition that this famous idol was not originally of the country he now resides in, but that about three or four thousand years ago he swam over the sea, and some fishermen seeing him lie at high-water mark, went near him, and, to their great astonishment, heard him speak in their own language. He told them, that he came from motives of pure charity to reside among them, and desired that he might have a good lodging built for him on the same spot of ground the temple now stands on. The fishermen told their story to their priests, who came in crowds to see the statue that could speak. They would have excused complying with his request in building him a temple, but he would take no denial.

Ridiculous as this story may appear to some, yet we find many equally ridiculous among the Roman Catholics; for as the Christian religion is, in part, founded on miracles, so all false religions, all impostors, pretend to something of the same nature.

The prince of this country is a heathen, subject to the great Mogul, and pays a tribute of one hundred and twenty-five thousand pounds annually. This money is paid into the exchequer at Cattach; and the prince exacts a tribute of half a crown per head from every pilgrim who comes to visit the temple, which generally amounts to seventy-five thousand pounds annually. When I was there, the prince sent to me, desiring I would wait upon him; but I was obliged to be excused, because I had at that time a fit of the gout. He was satisfied with my excuse, and sent me a fat buck for my supper. The reason why he took such notice of me was, he had been one day hunting, and fell and broke his thigh; an English surgeon being in company, performed a complete cure, for which the prince made him a present of forty-five pounds sterling.

Leaving this place, I travelled up the country towards Cattach, on a very fine road, where I saw many droves of cattle, wild game, and the tombs of pilgrims, who had signalized themselves by severe penances; and one in particular had built a tomb for himself about three months before I came there, and when the tomb was finished he went into it, and starved himself to death. Here was a work of superstition in him, not to be equalled in the whole of the Roman calendar.

Near this place we entered the province of Anipova, and the town where the Rajah resided was of the same name. There is a fine navigable river, which invites strangers to visit it, because of the vast quantities of cotton and rice which are brought here to the markets to

to be sold. For the space of one hundred and twenty miles I rambled from the temple above-mentioned, till I came to this place, I found the whole face of the country covered over in a manner with vast numbers of small villages, beautiful gardens, cultivated fields, small streams of fresh water, and temples built in the woods. At the end of every ten miles a toll-gatherer was placed, who collected from each of us about three-pence, which they call junkams.

There is a fine harbour here, with about seven fathom water at spring tides, but it has not been much frequented by Europeans since the custom-house duties have run so high.

When I came to the river Cattach, I espied a small temple, built in the form of a cupola, and the outside had holes in it like the holes of a pigeon-house placed in order, and in each of them was a human skull. Enquiring the reason why such a number of skulls were put up, I was informed, that when Aurengzebe's army came to besiege Cattach, there was a conspiracy formed in the town to betray it.

The conspirators being routed, above five hundred concerned in it were by order of the king of Orix, who was then in the city, condemned to be beheaded, and their heads to be placed in those holes, where they have continued ever since. Cattach is still a very large city, encompassed by a wall, and cannon planted upon it; but it is not in good repair. There is not above one fourth of the town inhabited, but the ruins of many large buildings shew sufficiently its antient grandeur, when kings kept their court here. It is about three miles in length, and one mile in breadth. The garrison consisted of five thousand foot and five hundred horse. The English had once a factory in this place, but they have removed from it some years.

That part of the river upon which Cattach stands is rather shallow; for, when I passed it, there was not above three feet water. When a stranger enters the town, he must find security that he does not carry off any of the inhabitants without the Nabob's permission; and if the stranger can find no security, the Nabob's security becomes bound to pay him ten rupees for the danger he runs. Two Dutch renegadoes, who were in the Dutch service as gunners, came to wait on me with a present of mutton, fowls, and fish, and promised to be my security. I rewarded them with the usual perquisite due to the security, and gave them a bottle of French brandy, upon which they set a great value.

When I left Cattach, I travelled fifty miles in two days, and came to Bandash, which stands on the side of a river that runs into the sea at Cummaca, about twenty miles below the town. There are about one thousand houses in this town, which has a mud wall, but no cannon upon it. The inhabitants are very industrious, for most of them are employed in weaving all sorts of cotton cloth, and the rest in cultivating the ground.

From this place we returned back along the sea coast, where we found the country very low, and an island in the sea still lower. It was to this coast that Alexander led his army; after defeating Darius; but the effeminate manner in which his soldiers lived, rendered them in a manner unfit for service. It is true he got great riches here; but he did not long enjoy them, for he died at Babylon, upon his return to Europe.

On the banks of a river, supposed to be a branch of the Ganges, there is a town pleasantly situated, and called Piply. It was formerly a place of great trade, but is not so at present.—The same commodities are to be found here as in Ballasore. Near this place are several islands, but they are small and not inhabited, so that they are pestered with tygers; and it is very dangerous to land because of them, for sometimes in the night they will swim to the ships, and, if they can, will kill some of the seamen.

All the inhabitants of this country are Pagans; and here, as in other parts of the Indies, the women burn themselves after the death of their husbands. Some years ago one Mr. Charnock went with his ordinary guard of soldiers to see a young widow act that poignant scene; but he was so smitten with her beauty, that

he took her away by force, and conducted her to his lodgings. They lived many years together in the most loving manner, and had several children. At length she died, after he had settled at Calcutta; but, instead of his converting her to the Christian religion, she brought him over to paganism; and all the Christianity he shewed when she died, was to see her decently buried. He erected a handsome tomb over her grave, and, as long as he lived, he kept the anniversary of her death, by sacrificing a cock on her tomb, after the Pagan manner.

In 1739, Mr. Weldon was sent over from England to remove the factors from Fort William and Calcutta to Fort St. George and Bombay, which at that time was under the direction of a governor and council. Previous to this, the governor of Fort William had acted in a very arbitrary manner, dispensing justice, or rather injustice, in whatever manner he pleased. The company have a pretty good hospital, where the seamen go to receive advice under their different disorders; but they are generally so much neglected, that few ever come out to tell in what manner they have been treated.

Here are several good gardens on this spot in which most kinds of vegetables grow; and here are also several fish-ponds. The town is well supplied with most sorts of provisions, both good and cheap, and it is continuing daily to flourish. Possibly it may be a noted place in time; but this is to be doubted, from the governor and Indians not agreeing properly as they ought to do, where their mutual interest is concerned. On the other side of the river are docks made for repairing their ships, and a pretty good garden belonging to the Indians. This was a good spot for building a fort on; but the sun shines so intolerably hot in the afternoon, that it is almost impossible to live in it.

Most of the gentlemen in Bengal live in a very splendid manner; the forenoon being devoted to business, and after dinner to rest. In the evening they recreate themselves in chaises, or on the water in boats, that go swiftly by the force of oars. Before they return home, they spend some time in visits to one another in the most harmonious manner, when pride and contentions do not spoil society, which is too often the case among the ladies, in the same manner as when discord and faction prevail among the men. There are generally a considerable number of soldiers here to take care of the goods belonging to the company; for although they have free grant of the colony from the Mogul, yet disputes frequently arise.

A few leagues above Calcutta is Barnagul, a small village, where the Dutch have a factory; but the place is infamous, on account of the number of women being bought up for the purpose of lewdness. The Dutch countenance this abominable practice; for it is remarkable of those people, that they never pay any regard to morality, where their temporal interest is concerned. At this place the Dutch East-India ships come to anchor, and take in their cargoes for Batavia. Travelling twenty miles higher than this place, we saw a great many agreeable villages, and a factory belonging to the Danes, about four miles below Ughly; but the poverty of the Danes obliged them to desert it, after having robbed some of the Mogul's subjects to keep themselves from starving.

Nearly opposite the Danish factory, is Bankerbankfal, a place where the Ostend company settled a factory; but in 1723 they quarrelled with the governor of Ughly, who forced them to leave the place; so that they were obliged to take shelter among the French at Choronguer, where they had a factory, but it is now fallen to decay. About half a league further up, is Chinchura, where the Dutch envoy is settled. It is a large factory, surrounded with high brick walls, and the merchants have many pleasant houses on the side of the rivers, with pretty gardens before and behind them.

Ughly, the next place we visited, is a town of great extent, but very ill built. It is reckoned about two miles above the Chinchura, along the sides of the river to Bandal, a colony formerly settled here by the Portuguese; but they being driven out, it is now under the Great Mogul. Ughly carries on a great trade, because

all foreign goods are brought thither for importation, and all the goods in Bengal designed for exportation are also brought here. The Mogul's custom-house is at this place, and here upwards of sixty ships are loaded annually. The small vessels from the upper parts of the province come down here in the month of October, by the stream of the river, but are obliged to take them up again above five hundred miles. This was the farthest part I went to up the river Ganges, so that I cannot say any more concerning the country."

Thus far Captain Hamilton; but we are supplied with sufficient materials from other authors. About one hundred miles above Ughly, is Cafembazzoar, where the Dutch and English have factories. The town is large, and much frequented by merchants, who seldom fail of enriching the place where they trade. The country around it is healthy and well cultivated, and the people are as industrious as any in India, being mostly employed in carrying on valuable manufactories.

About twelve miles from it is Muxadabad, but it is now called Rajahmel; but although it was formerly a place of great trade, yet it is now very inconsiderable.

Maldo, a large town well inhabited, stands on another channel of the Ganges, about fifty miles to the eastward of Rajahmel. It is much frequented by merchants, and formerly the English and Dutch had factories here, but at present neither of them have any. Patana is the next town frequented by the Europeans, where the English and Dutch have factories for salt-petre and raw silk. It produces also so much opium, that it serves all India with that commodity. It is the place of residence of the prince of Bengal, who is always of the blood royal; and the town is large, but the houses are built at a considerable distance from each other. The country is pleasant and fruitful, but rather hot, for it is not above twenty-six degrees north of the equator.

About one hundred miles farther up the river, lies Bumares, celebrated for its sanctity by all the Pagans in India. Here are schools for the education of youth, where they are brought up in all the mysteries of their religion. Superstition prevails here in its greatest height of absurdity; and formerly some devotees used to throw themselves from precipices where they were dashed in pieces, but Aurengzebe restrained them; but it is still in such repute, that devotees travel upwards of four thousand miles to visit it.

The priests fill brass and copper-pots, made in the shape of short necked bottles, with the water of the Ganges, which they seal up, and send all over India to their benefactors, who make them good returns; for whoever are washed with that water just before they expire, are believed to be cleared from all their sins.

Daun, which is situated on the east branch of the Ganges, is the largest city in Bengal, and its manufactures of cotton and silk are both good and cheap. The plenty of provisions of all sorts is almost incredible, and the inhabitants are numerous. Here, and in the country adjoining, are vast numbers of elephants, very tame; but if they are disturbed, they will push at people with their tusks. There are many small islands in this branch of the Ganges, but most of them are so much infested with tygers and other wild beasts, that it is not safe to land on them. The religion established by law in the kingdom of Bengal, is Mahometism, but for one Mahometan there are above a hundred Pagans.

The Pagans are better contented to live under the government of the Great Mogul, than under that of their own princes, for the Mogul taxes them moderately; and every one knows what he must pay, but the Pagan princes tax at discretion, making their own will the rule of their conduct.

Arackan is the next maritime country to the south of Bengal, and in former times made considerable figure in trade. It was into this country that the unfortunate Sultan Sujah came a supplicant for protection,

when Emirjemal cheated him out of Bengal. He carried his wives and children along with him, and about two hundred of his subjects, who were destined to follow his example; and he had in his possession six or eight load of gold and jewels, which proved his ruin, and in the end the ruin of the kingdom of Arackan.

When Sultan Sujah first visited the king of Arackan, he made him presents suitable to the quality of the donor and receiver; the king of Arackan promising the sultan all the civilities due to one of his rank, with a safe asylum for himself and family, when Emirjemal knew where Sultan Sujah had taken sanctuary, he sent a letter to the king of Arackan, wherein he demanded the poor distressed prince to be delivered up to him, otherwise he threatened to bring his army into his country and take him by force. This threatening letter wrought so far on the base Arackaner, king of Arackan, that he contrived ways and means to pick a quarrel with his guest, and at last found a fair pretext to put his scheme in execution.

Sultan Sujah had a most beautiful daughter, and the king of Arackan desired her in marriage, but knew at the same time that Sultan Sujah would never consent to the match, he being a Pagan, and she a Mahometan. Her father used all reasonable means to dissuade the king from his purpose, but in vain; for he grew daily more and more pressing, and Sultan Sujah gave him at last a flat denial. Upon this the base king gave him peremptory orders to depart out of his dominions in three days, and forbid his subjects to furnish him with any more provisions, even for his money. Sultan Sujah knowing that it would be death for him to go to Bengal, resolved to pass over some mountains overgrown with woods, into the king of Pegus's dominions, which were not above one hundred miles off. Accordingly next day, he set off with his family and treasure; but the barbarous king sent a strong party after him, who overtook him before he had got far into the woods, and killed most of his attendants. He seized on his treasure, and brought it back in inglorious triumph; but what became of Sultan Sujah, and his beautiful daughter, was never known. Probably they were either killed in the skirmish, or devoured by wild beasts in the woods. So rich a treasure had never been seen in Arackan before; but to whom it should belong, caused some disturbance. The king insisted that the whole belonged to him: those that fought for it, claimed a share; and the princes of the blood wanted some fine large diamonds for their ladies; but the priests found out a way to accommodate the difference, by persuading the king and the other plunderers to dedicate it to their titular god or idol, whose name was Dagon, and was of the same shape and figure as the Dagon in scripture.

This they consented to; and soon after the perfidious king died, leaving his dominions between his two sons, who quarrelled concerning the distribution of the treasure which had been given to the temple. They raised separate armies, and attacked each other, but both were cut off. The kingdom was left in a state of confusion, the people divided, and the treasure among themselves; and it was not till a long time afterwards that they were reduced to order.

Arackan has a spacious river, with an exceeding good harbour at the mouth where it falls into the sea, deep enough to accommodate the largest ships, and spacious enough to contain above a thousand.

The sea-coast of Arackan reaches from Xatigam to lake Negrals, above four hundred miles in length, but in few places inhabited; because there are such vast numbers of wild elephants and buffaloes that would destroy the productions of the ground, as the tygers destroy the tame animals. There are abundance of islands on the coast of Arackan, but they lie close to the shore, only the Buffalo island lies about four miles off; and there is a rock that shews its head above water in the middle of the channel, between the Buffalo island and the continent.

The

the various Amusements of the Oriental Ladies.

concourse of people, making a most disagreeable and confused noise with their drums, and such other instruments as they had. The ambassador was nobly received, and all the ships in the harbour fired in token of respect to him.

On the eleventh we went into the Venetian inn, and took leave of the sea for some time. The natives, from our dress, thought we were merchants, but they treated us very civilly, and gave us all the indulgence and assistance they could. We had brought several bills of exchange; and when we had got money for them, we laid it out in pork; for all the Mahometans abominate swine's flesh, so as not to touch it on any condition whatever.

Alexandria, the largest city in Egypt, was built by Alexander the Great, about three hundred and thirty years before Christ, on the coast of the Egyptian sea, and in that part of Africa which lies nearest the mouth of the Nile. The Ptolemies, the successors of Alexander, enlarged and beautified it, and for some time it was considered as the greatest mercantile city in the world. Here are many pillars and obelisks; and there might still have been many more; but the Roman emperors removed the most magnificent of them to Rome. It was here that Ptolemy Philadelphus ordered the seventy learned interpreters to translate the scriptures out of Hebrew into Greek; and here was one of the most valuable libraries in the world.

Without the walls of the city is to be seen Pompey's pillar, sixty cubits high, and underneath it they tell us his head is deposited. The city is still in a flourishing condition, and not only visited by merchants from Persia and Armenia, but likewise by the Venetians and Genoese. There are many fine buildings in Alexandria, and although most of the walls are demolished, yet there are many fine gardens, which makes it agreeable in the hot weather for the people to solace themselves under the trees and shady bowers. They have two high towers in the suburbs; and I was assured that from these they sent pigeons to Cairo, with letters tied to their feet.

As for the harbour, it is so contrived, that even in time of peace it is not easy to get into it; for the entrance into it is not only spiral, but also crooked, by reason of several rocks and stones that lie hid under the water. The left side is inclosed by artificial moats; and on the right is the island of Pharos, upon which there is a tower. This tower was formerly considered as one of the wonders of the world, it being so prodigiously high, that sailors could see the light on the top of it at the distance of forty miles, and by it steer their course to land. The harbour within is very safe, and about three miles and a half in compass, into which all sorts of merchandize that the country wants are brought from other parts of the world.

While we were one day at a feast with the merchants, a certain Venetian told us, among other things, that in one year he could gain ten thousand crowns by one ship's loading of silberd-nuts from Apulia; and that by sending one ship every year to Tripoli in Syria, he could make twelve thousand crowns; and the reason he gave was, that all the Mahometans use that fruit very much; for although they have excellent fruits of their own, and great variety of them, yet they soon spoil. For this reason they export their own fruits, as soon as they have pulled them, into other countries, and buy nuts from the merchants at Alexandria.

In the mean time we provided ourselves with all things necessary for our journey, and being recommended to the sultan's ambassador who had sailed along with us, we made him a present of fifty gold pieces, that under the favour of a guide appointed by him, we might travel the more securely. The money was what he had long cast his eye on; for he was always very accessible and affable; assuring us, that he would do any thing to serve us that lay in his power. But no sooner had he got our gold in his pocket, the hopes of which had made him so courteous, than he

began to flight and look down upon us, which we in the mean time, considering ourselves as strangers, seemed to take in very good part.

On September 22, we mounted our mules, accompanied by several Italian merchants, having with us a Mamluc for our guide, and arrived at Rosetto; but before we were permitted to enter the gates, the officers obliged us to pay a small piece of silver each. Here we lodged all that night, and in the morning continued our journey through a wood of date-trees, and others, which emitted a most fragrant smell. We sat ourselves down under a date-tree, deeply laden with fruit; and having eaten of what provisions we had, we drank of a cooling stream adjoining, and took so much water in as we thought would be sufficient to serve us through the dry country we were just going to enter upon.

From thence travelling through fens which the Nile had filled at its last overflowing, we came to the sea, having rode the most part of that day. Afterwards we came to other seas, where we found a crew of Arabians fishing, who by downright threatenings and violence forced each of us to pay them a small contribution. After that we turned away from the sea, and towards sunset came to a little solitary cottage, where we tied our mules, being forced to lie on the sand all night.

It happened then to be moonlight; by reason of which, we, who were not accustomed to such beds, were afraid of robbers; and therefore before we had rested four hours, thought it best to decamp, the night being pretty clear. After this we came into a desert covered with salt, and yielding sands. There blew a small gale from the sea, which raised little hillocks of sand behind and before us, so that we could not know where the road was; for it frequently happened that when we saw the road plainly before us, a vast number of these hillocks would in an instant rise up, and again dissipate, and then gather in another place. This contributed so much towards obscuring the way, that we knew not how to proceed. While we were in this doubtful condition, not knowing what to do, we came to a wood of date trees, and there we took shelter for a few minutes, when, to our surprise, we heard a cock crow. We bent our journey that way, and soon after arrived at Rosetto, where having rested ourselves, and having taken a little refreshment, went to rest.

Rosetto is a town in Lower Egypt, lying south and north on the banks of the Nile. It has no walls round it, but there are so many lofty towers and other magnificent structures, that one at first sight is apt to consider it as a very great place.

The river Nile will be taken notice of afterwards; and therefore at present we shall content ourselves with describing in what manner it causes so much fertility in Egypt.

The country of Egypt is plain, so that it has few or no rivers; but the want of this is made up by the overflowing of the Nile. The waters falling under the Equinoxial Line, once in the year, are, for some time, drunk up by the sand; but a continual supply of water creates this famous river, which runs northward till it falls into the Mediterranean Sea. At Cairo it overflows Egypt; and when the dry season approaches, it leaves such a slime on the ground, that they have no occasion for any other manure. This is the reason why Egypt is so fertile; but even that, although one of the greatest blessings of Providence, if properly improved, is much neglected by the people. It is true, some of them cultivate their grounds, but the far greater part spend their time in idleness; whereas were they to apply themselves to labour, they might have vast quantities of valuable goods to sell to strangers.

September the 25th we began to sail up the river, and the same evening we found several fine gardens, with pomegranates and other trees growing in them, and in them were many delicious fruits. Among the trees were many small cottages, belonging to the poorer

poorer sort of the Egyptians, and here were a vast number of beautiful monuments. The Egyptians, induced thereto by an antient tradition, pay little regard to their houses, but bestow much expence on their funeral monuments.

The 26th we continued sailing up the river, and what we had been informed of when at Alexandria, we now found to be true, that Tongobardine, ambassador from that sultan, overtook us with a great number of Mamlucs. As we had not given him any offence, so we did not trouble ourselves about him, especially as we believed he came from the same motives of curiosity as we ourselves did.

As we sailed along, we saw on the banks of the river a vast number of cottages, and often went on shore; where we made the verdant grass our table when we wanted to refresh ourselves. At that time we saw a little boy, a Moor, receive twenty lashes on his back and on his belly, because he had drank a glass of wine. Every night Tongobardine caused to be lighted up a great number of lamps, in the form of a pyramid, and several little bells were tied to the sails, into which the wind blowing with a little swell, made a certain agreeable melody in them, and very pleasing to the ear. But the Mamlucs that were in the other boat, when it was dark, shot up fiery arrows into the air, which, in some measure, resembled falling stars.

We, who followed in the third boat, were not behind the rest in our sports; for we had with us an Egyptian trumpeter, who, although he knew nothing of music, yet made such a sound, that none could have heard it without bursting into immoderate fits of laughter. In this manner we spent the night; and in the day we were agreeably entertained with beholding some of the most charming scenes in the world.

All along the banks of the river were fine cultivated grounds, small woods, and pleasant villages. We saw many crocodiles, some of whom were above forty feet long, and their eggs the shape of a goose's, but larger. They lay vast numbers of these eggs in the sand; but lest they should increase too fast, there is a creature called the ichneumon, which destroys them as soon as they are laid.

One day, while we were sailing up the river, and sometimes having our boats drawn with ropes, we saw on each side great numbers of Arabian boys, with famine painted in their faces, begging some victuals; they ran with such swiftness, that they kept pace with our boats, and as they ran they struck their buttocks with the soles of their feet.

Near one of the villages we saw a great number of Egyptians making merry; it happened to be one of their festivals. They were all on foot, dancing, except one, who sat on horseback in the midst of them, and looked over their heads; and when we asked what was the meaning, they told us, that he who sat on horseback had been that day circumcised, and the rest were met to celebrate the solemnity; for the Egyptians never circumcise their sons till they are thirteen years of age.

September the 23d we came within sight of the lofty pyramids of Memphis, and by that knew that we were not far from Cairo. In the morning we arrived at Bulaco, which is the next port to Cairo for those who are coming up the Nile; on the 26th we landed our mules, and drove them before us to Cairo. By the way one of our company happening to be fatigued, got up on one of the mules, when a company of Mamlucs coming along threw him to the ground; for the Mamlucs pretend, that whoever meets them on horseback, and does not alight till they pass by, ought to be thrown down. Not long after we entered the city of Cairo, and took up our lodgings in a place where we were to remain till we were joined by Tongobardine, who had staid behind. This Tongobardine was a Spaniard by birth, and had been a deacon in a church; but leaving his own country, he renounced Christianity, and became a Mahometan. At last, on the 30th of September, Tongobardine arrived, dressed

in a rich garment that had been presented to him by the state of Venice, attended by a great number of Mamlucs. He had thirty-five wives, who all resided in an upper part of his house, waiting for his arrival; as soon as they were told that he was come, they all joined together in such a roar of joy as was sufficient to frighten a score of wild beasts. In the middle of his palace was a court, and windows around it, and we being placed within these windows on one side, could see every thing that was transacted. The whole court was spread over with large carpets, and upon these carpets were set two hundred and sixty large dishes filled with great variety of sweetmeats; when every one present had tasted a little, they hastily rose up, and having asked leave to be gone, returned thanks, and all went home in a real state of sobriety. As soon as they were gone, the remains of the entertainment were swallowed up by some poor people who waited at the door for it.

In the mean time we having, by the advice of a certain Greek, procured Egyptian habits, girdles, and ornaments for our heads, went through every part of the city, viewing every thing worthy of notice; having one of Tongobardine's slaves for our guide. This was the more necessary, lest we should either have lost our way in the streets, or inadvertently gone into places forbidden to strangers by the laws of the country.

Memphis, now called Cairo, was once the capital of Egypt, and was built about a thousand years before Alexandria. It stands in the most commodious place in the whole country, namely, where the Nile divides itself into several branches. On one side it is fortified with strong ramparts to defend it, both from the Nile and from an enemy; on the other, it is rendered almost impregnable by a deep artificial ditch, which is filled with the superfluous water of the Nile. It is extremely populous, and there are a prodigious number of mosques in it. It is divided into two parts, one of which is called Cairo, and the other Babylon; and the reason why the name of Babylon was given to the last is, that several emigrants having left Mesopotamia, came and settled here, and built this part of the city, giving it the name of that famous city Babylon.

On the sixth of October Tongobardine sent for us, to come to him, that we might behold the splendor in which he lived. At night he called me and my company, with two Franciscan friars, to him, and took us into his women's apartments. He sat himself down in the midst of his thirty-five wives, all striving who should be first to please him. He ordered us to take our seats on silken carpets, with which the room was covered. Sometimes sporting with one, and sometimes with another of his wives, he began to argue, that no life in the world was so pleasant as that which he enjoyed; but the two friars and myself did not think proper to contradict him.

The ointments and perfumes that were about the women smelt so sweet, and the sweet-meats and liquors that were presented to us were so fine, that nothing could be imagined superior to them then. He promised to treat us next day, and in the mean time permitted us to return to our lodging. He kept his word, and we were entertained with a vast number of sports, such as racing, jumping, dancing, and tumbling. Here were two regiments of youths in this city, who entertained us with a mock fight; and when it was over, they all walked up to the Sultan of Egypt, to whom they delivered their shields and scymetars.

Although our relation of Africa will include a more particular account of Egypt, from the works of other travellers, than what is here given, yet we could not disjoin theirs from the part of the author's narrative, without spoiling the whole. And it is likewise necessary to observe, that, as he mentions two sultans several times, in this part of the narrative; it was not the Grand Seigneur, but only the Sultan of Egypt; for Constantinople was not taken by the Turks till

near

near forty years after Baumgarten wrote his narrative. Baumgarten's narrative begins in 1505, and Constantinople was not taken by the Turks till 1545; ever since which time the sultans of Egypt have been called Bashaws. But to go on with the narrative.

Early in the morning on the 15th of October, having loaded our mules and camels with panniers, equally poised on both sides, we seated ourselves above them; and departed from Cairo in company with the two Franciscans already mentioned. After we had been terribly shaken by the travelling of our camels, to which we had not been accustomed before, we arrived at Alcairo, where we lodged in the convent belonging to the Greek monks, who used to collect provisions, and send them from hence to the convent on Mount Sinai. Alcairo is a large populous city, a few miles from Cairo, in a sandy desert; but, like the rest of the cities in Egypt, it has no manner of fortifications. Here some wild Arabs came and assaulted us, demanding money; and we were obliged to comply with their request, otherwise, perhaps, we might have had our brains knocked out.

October the 7th we mounted our camels, and before we had travelled a mile overtook a caravan. They staid waiting till a sufficient number of travellers should come up, that they might the more securely travel through that country, which is pestered with bands of wild Arabs, who get their living by plunder. Having there unloaded our camels, and made a sort of entrenchment with our panniers, we sat down within them with our baggage. In the night, when the travellers who were with us went to sleep, we took a little refreshment, and each of us took our turn in watching our baggage; while, in the mean time, we were almost suffocated with the noisome smell of the camels. About the middle of the night we heard a most terrible cry at the further end of the caravan, for some Arabs, who had broke into our little camp, had run off with some carpets, a horse, and a sack of bread.

October the 8th we entered the Deserts of Arabia, through which the Israelites passed in their way from Egypt to the Promised Land; and being joined by a great many other travellers, the number of men and camels did so much increase, that we had an army consisting of several thousands. On the ninth we marched thro' a large and dreadful sandy desert, where nothing that was green appeared, not so much as briars and thorns, nor the least shrub, till towards night, when we came to a plain, where there were some shrubs with green leaves, which our camel-drivers pulled, and gave to the creatures to eat. On the tenth day we came to the bay of the Red Sea, where the antient Egyptian kings began a canal to join this with the Mediterranean. Not far from this place we were shewn a well hewn out of the rock, which they told us was the place where Moses struck the rock; and procured water for the children of Israel. We tasted the water, but it was too salt, although our camels drank plentifully of it. This is that bay never to be forgotten, which the children of Israel, under the command of Moses, passed over without wetting the soles of their feet. Here it was that Pharaoh, with his numerous army of horse, foot, and chariots, was overwhelmed by the violence of the waves; and the people shewed us what they called the print of the chariot-wheels upon the stone. This day one of our camels happening to die, some of the Egyptians, who accompanied, cut him in pieces, and eat his heart as a most delicious morsel. Next day we were attacked by a band of Arabs, but we had the good fortune to drive them away without any loss, except a few things they stole from us while we were in confusion.

On the eleventh day, taking a compass round the bay, but close by the shore, we saw another caravan coming from Althor with flocks; then looking from a rising ground, we could neither see the front or rear of the caravan, it was so large, consisting of a vast number of men and camels. In the evening of the

same day we came to Elim, where there were antiently twelve wells and seventy palm trees. [See Exodus xv.] The wells are there still, but no palm tree, only a few low shrubs. Here it was that the Israelites encamping eat of the fruit of these trees, and drank of the water of the wells. The year before we came there, fifteen men perished within a few miles of these wells for want of water, not knowing their way to them. Here we pitched our tents that night, when another of our camels died, to the no small pleasure of the Egyptians who accompanied us; for they ate every bit of the flesh off his bones raw. On the twelfth we travelled up the mountain that overlooks the Red Sea, and there we found that all the water we had brought with us was spent, and therefore we were under the necessity of taking up what water we could find with our hands, and put it into our vessels; it was not only muddy, but also very bitter. Within sight of this place they shewed us a well called Gondole, constantly vomiting up fresh water. At that time one of the Franciscans, not sitting right on his camel, but shifting from one side to the other, seemed to tire his beast, which so enraged his master, that he struck the Franciscan on the face, and wounded him.

On the thirteenth day, after crossing some high mountains, we came again in the evening to the Red Sea, where, because the roads were too narrow, we were obliged to alight, and walk on foot, getting small stones and shells along the shore. On the fourteenth day, as we were travelling over high mountains, our water again failed us, and we had nothing to eat besides old cheese and hard bread. An Arab, who was along with us, went for a small trifle, and brought us a large bottle of water; which, although it was full of little reddish worms, we strained through a cloth, and drank it with a great deal of pleasure. The poor Arab no sooner received his reward, which was a small piece of silver, than he bored a hole in his wife's ear, and hung it to it; upon which she immediately fell a skipping and dancing in a strange manner, and bowing to us, touched his knees who had given her the money, and kissed his hand. In this part of the country we saw a great many trees with thorns; here priests and people, both Mahometans and Greeks, have a tradition, that the crown our Saviour was crucified with, was made of those thorns.

In the evening we entered into a valley between two rocks, and lest we should have been robbed, we pitched our tents there for the night. In the mean time our camel-drivers took the beasts a considerable way to give them water; for those men are so well acquainted with the country, that they always know when they are in danger. We kept guard for our own safety during the night, and enjoyed some rest, which we had not had for some days before.

On the fifteenth we came to some steep horrible mountains, where we imagined human feet had never trod. A bitch belonging to one of our guards having whelped, rather than remain behind us in such a solitary desert, left her young ones and followed us. That day, about noon, we came to a date-tree garden, where we were used in a most barbarous manner by the people who lived in the neighbourhood; for, understanding that we were Christians, they came out of their holes with a design to rob us; and raising a most hideous cry, threatened with their bows and spears to kill us; some of them were so barbarous as to knock us off our camels; while others, more humane, endeavoured to protect us from their fury. Our interpreter neglected us for some time, but at last he returned, and did his duty. We suffered much, having been robbed of several useful articles; but at last we purchased their favour, by giving them a few small presents.

Having got clear of this garden, or rather wood, we were soon afterwards attacked by another body of wild Arabs, who extorted another tribute from us. This we were obliged to comply with, lest we should

have

THE ARAB of the DESERTS

have been treated in the most barbarous manner. This evening we laid down to rest, and rose about midnight; but our camel-drivers were so unruly and mutinous, that they would not proceed unless we gave them money, which we were obliged to comply with.

Next day, about morning, we came to the monastery of St. Catherine; and, being admitted, we delivered the letters we had brought from the Patriarch of the Greeks at Cairo. The Abbot of the convent assigned us a room; but just after we had undressed ourselves, and were going to rest, a body of wild Arabs broke in, and seized our things as if they had been their own. They called out for us in a language we did not understand, and we having satisfied them, they laid down our bundles, and went away peaceably. After this, we got a few hours rest; and in the morning, before day, we went up mount Horeb, so much and so justly celebrated in the Old Testament. There were in company with us two Greek monks, and three Arabians, who lived in the monastery of St. Catherine, whom our interpreter had designed to be our guides, himself being so fat and unwieldy, that he could not climb to such a height. We ascended the mountain by the light of the moon, and carried provisions along with us; but we were obliged to rest by the way, and encourage each other to bear the fatigue. The ascent of the hill is both steep and high, and, as the monks, who were our guides, told us, it has seven thousand steps of square stone, besides the greater part where the ascent is natural.

Having got about half way up, we came to a chapel dedicated to the Virgin Mary, and within it a pure stream of water, which is of great service to travellers.

At that chapel our three Arabs, who had been sent to be our guides grew very ill-natured, and with their drawn swords in their hands, would neither suffer us to go backwards or forwards, till we promised them some money, which we found ourselves obliged to do, rather than fall out with them.

From thence we went to the chapel erected in memory of the famous prophet Elijah, who resided here forty days, when he fled from the wrath of Ahab and Jezebel. See I Kings xix. 3. At last, after much trouble, we reached the top of mount Horeb, where, in the most humble manner, we offered up our hearty thanks to almighty God, who had preserved us hitherto, and brought us through many difficulties. From thence we went to another part of the mountain, where we found a church dedicated to our blessed Saviour; and, according to tradition, built upon the spot where Moses received the tables of the law from God. About fifteen miles from this church is a Turkish mosque, built upon the spot, according to tradition, where Moses fasted forty days and forty nights. In the church dedicated to our Saviour, we laid down on the bare ground, thinking to get a little rest; but our Arabs, who were sent to conduct us, took care to prevent us, for after their devotions at the Mosque, they made such a hideous noise all the rest of the night, that we were forced to get up.

About sun-rising we came down the east side of the mount Horeb, by a very steep and dangerous way, and came into a valley between Horeb and Sinai, in which we found a monastery dedicated to forty saints. Here we sat down to refresh ourselves a little, and left our baggage to the care of a Greek monk, and then began our journey; but had not proceeded far when our guides again demanded money, and, as we had none to give them, we were obliged to promise them some as soon as we returned.

For our greater security we took with us another companion, a monk of the monastery of St. Catherine, whom our guides swore they would kill, if we did not make good our promise upon their return. We began to take heart, and continued our journey with much more comfort than we had done when we ascended mount Horeb; for by this time the sun had got above the horizon, and the tops of the mountains, with which we were surrounded, intercepted the cool and

refreshing breezes. But we were so stupid, that we forgot to bring bread along with us; and our guides had made us believe, that we could find water enough without going out of our road. This, however, was an imposition put upon us; for these Arabs have no regard for truth; they take the utmost pleasure in stealing, and seem to consider honesty as no better than folly.

The mount was both slippery and steep, so that for the most part, we were obliged to crawl on our hands and feet. And besides, it frequently happened, that where we laid hold of stones, thinking thereby to advance in our journey, they gave way, fell down upon us, and almost choaked us with earth. But having ascended a little higher, we were somewhat refreshed in consequence of the cool breezes that began to blow, and were diverted with the sight of the wild goats running about the top of the mountain.

Having refreshed ourselves with a little sugar, we again renewed our toil with fresh vigour, and began to encounter fresh difficulties, sometimes climbing, and sometimes crawling on our hands and feet, till we had almost lost our breath. And besides, both the Monks and Arabs were so ill trained, that they hardly knew the mountain; for there were a great many tops of high mountains so like one another, that for a long time it was difficult to distinguish the one from the other, if there had not been some heaps of stones lying here and there, which had been gathered by others, to direct succeeding travellers in their way. By these means, our guides coming at last to know the top of Mount Sinai, got before, and called to us with a great deal of joy, which so inspired us with courage and vigour, that we followed them with alacrity. But, at last, the ascent grew so difficult, that all our former toil seemed but sport to this. However, we did not lose hopes, but, imploring the divine assistance, used our utmost endeavours.

At last, through untrodden ways, through steep and hanging rocks, as well as cliffs and horrible deserts, pulling and drawing one another, sometimes with our staves, sometimes with our belts, and sometimes with our hands, by the assistance of almighty God, we all arrived at the top of the mountain.

The top of mount Sinai is not above thirty paces in compass; and from it we had an unbounded prospect of the countries around us. Then we began to consider how much we had travelled by sea and land, and how many difficulties we had yet to undergo.

Mount Sinai raises its lofty head so far above those of other mountains, and affords such a prospect, that although the Red Sea be three days journey from it, yet it seemed to us not above a gun-shot. From hence we saw several desolate islands in that sea, and beyond it the deserts and mountains of Thebais. From thence also we discovered Athor, that famous port on the Red Sea, into which all the ships laden with spices from India came, and from whence they are carried on camels to Alexandria, where they are sold to the Europeans in general, and indeed to peasants of most nations.

Having satisfied our curiosity, and blessed the Divine Being for his protection, we prepared to descend the hill, which we found more easy than the ascent; and in a short space of time we found ourselves at the monastery of the Forty Saints, where we were refreshed with a cup of wine and a little bread and cheese.

This monastery had for some time been full of monks, but some bands of Arabs envying their happiness, rushed in, and killed every one of them; and there being forty of them, that circumstance gave name to the place. Now it lies almost desolate, except that two of the monks of St. Catherine are constantly sent there to perform divine service, after the manner of the Greek ritual. Near this little monastery, there is a most delightful garden of pomegranates, almonds, figs, olives, and other sorts of trees; and what renders it the more delightful, it is situated in the wilderness.

Leaving this place, and taking a compass about Mount Horeb, we came to the famous stone which

Moses struck with his rod, and brought out of it as much water as served the whole camp of Israelites to drink. And tho' it is said Moses struck the rock only twice, yet there are twelve marks upon it, according to the twelve tribes of the children of Israel; which miracle was the greater, because the stone, though separated from the rest of the rock, and is almost of a square figure, yet it is fixed in the body of the ground by only one pointed corner, and consequently not in so fit a posture to extract any moisture from the earth. And therefore its sending forth such abundance of water must have been the work of an almighty hand; and to this day there comes a sort of liquor out of one of these crevices, which we both saw and tasted.

Near this is the place where the earth opened her mouth and swallowed up Korah, Dathan, and Abiram, with their families, and all that belonged to them, for having rebelled against Moses, and consequently against God. A little further on is the well which Moses made the people drink of after they had worshipped the golden calf. And adjoining to this is the place where the Greek monks, who have convents there, are buried. About evening we arrived at the monastery of St. Catharine, and found ourselves so fatigued, that we would have gone to rest without any refreshment, had not the monks kindly persuaded us to it.

On the 19th, we went into the church of the convent of St. Catharine, which was once a very fine edifice, but is now fallen to decay; being supported by six small pillars, on the tops of which the Greeks deposit the reliques of their saints. We went to hear prayers with the monks, according to the Greek ritual; and after service was over, they went to visit the tomb of St. Catharine, singing litanies, one carrying a book, and the rest following him.

All these monks had poor ragged habits and hoods, with wax candles in their hands; and having burnt some frankincense on the Virgin's tomb, they retired. They considered it as a great honour conferred upon us, to let us see the reliques; and they gave us a small shred of the silk in which the body was wrapped.

This monastery is said to have been built by the emperor Justinian, which is not at all improbable, for that prince was a very superstitious man, and a great favourer of the monastics. The rooms are low and mean, for the poor monks live in continual fear of the wild Arabs.

An aged monk told us, that above fifty Arabs were fed at the convent every day, nor dared they to dispute with them. The monks acknowledge no superior but their own prior; so, that although they use the Greek litany, yet, properly speaking, they are neither of the Greek nor Latin church, having many customs peculiar only to themselves, and unknown to all others.

Having seen every thing worth notice about the convent, we packed up our baggage, and set out in the morning by moon-light. As soon as day-light appeared, we were shewn the graves of the three thousand men, children of Israel, whom Moses commanded to be slain, for having worshipped the golden calf. Here we saw the image of the calf cut in stone, in memory of the golden one that was burnt; the ditch in which the idol was made, the adjoining water into which Moses threw the ashes, and the stone on which it was broken in pieces. Having viewed all those things, we travelled on, and overtook our camels, which had by this time got a considerable way before us.

An Arabian thief had stolen a coat from one of our camel-drivers, and would not restore it until we had given him six pieces of silver; we were obliged to stop the mouths of others of the same gang, by giving them money, for they came to take their farewell of us, flocking about us as vultures do about a carcase; After this we mounted our camels, and continued our journey over more ragged paths than many we had yet seen; but it was not long, so that we got to the end of it before night, and pitched our tents.

On the 20th, we got up at sun-rising, and went

on our journey through the date-tree wood mentioned before, and here we were obliged to give money to another band of Arabs, two of whom stole from us a couple of pullets, and walked up the hill without saying a word. In the evening we were robbed by another band of robbers, who took from us some biscuit, with other things.

Here the Arabs are under no law or government; they are all alike, only that every father is master of his own family, but his power extends no further. Sometimes five or six families, with their wives and children, go out in the spring season, and do not return home till winter. During these excursions, they live wholly by robbery; for, although they take along with them the rich spices of their country, yet they make the people purchase them at what price they please.

Some of them travel as far south as Egypt, and even into Ethiopia, where they lay in hords in the fields like so many beasts; others travel northward, through Syria, as far as Jerusalem; and they not only plunder European travellers, but even lay the Turks, who vainly boast they are their masters, under contribution. As for reducing them, it is in a manner impossible, for though like other barbarous nations they are very numerous, yet a thousand of them are seldom found together; so that before ten thousand of them could be brought into subjection, an army of double that number would dwindle away to nothing. I have often wondered, that though they live by plunder, yet I could not find that they murdered any person. It is true, they will threaten severely, but when they get a little, they go away without complaining, or doing any further injury. However, I am willing to ascribe all this to the wisdom and goodness of God, which will not suffer men to do all the mischief they otherwise would.

Not long after we had parted with these robbers, we alighted and laid ourselves down to sleep; for the uneasy pace of the camels had so tossed and shaken us, that we thought our flesh and bones would have parted from each other: and here it may not be improper to give some account of that extraordinary animal.

The camel is a four footed animal, having ill shapes and a very strong smell. His tail is like that of an ass, its feet are fleshy and soft, and cloven in the middle before, but the hinder part is intire. It has two knees on each fore-leg, and when it receives its burden, it kneels on both of them. It has no teeth in the upper jaw, and eats and drinks very little considering its bulk; for it can travel four days without water. It sucks its water cross-ways, and but very little of it. The least cooling breeze, which is so refreshing to animals in general, makes it lazy and slow; so that in such cases the driver is obliged to stimulate it by blowing a pipe, or tinkling a small bell; but heat has quite the contrary effect upon it. There are two sorts of them, namely, the Arabian and the Battavian; the former have two hunches on their backs, and are swifter than the others. These are called Dromedaries; but the latter have only one hunch, and are used in carrying burdens.

On the twenty-first day we got out of these horrid ragged mountains, into the plain that stretches itself all the way into the Red Sea. Here we met with the caravan we had parted with, and it was joined with another richly laden. All our fears fled away when we found ourselves fortified with such a multitude of men and beasts; but travelling all that day without eating or drinking, we frequently fell asleep. A thousand strange dreams came into our heads, while we sat nodding on our camels, and frequently imagined we saw somebody reaching us victuals and drink. We underwent the same hardships all the twenty-second and twenty-third days, mutually pitying one another, and exhorting each other to patience and resignation.

On the 24th, our camel driver, who was an abandoned rogue, led us away from the caravan into a sandy desert, where we alighted to rest ourselves, upon which the fellow came up, and told us, that unless we would give him money, he would leave us there

there to perish; we were obliged to comply with his insolent demand, and remounting our camels, got to Alcairo in the evening, spent with fatigue, hunger, and drought. Thus being five days on our return, we ended a journey that cost us eight in going.

Having refreshed ourselves, we returned to Cairo from whence we had set out, and were received with the utmost joy by the Venetian merchants, who had almost despaired of our return. They listened with the greatest attention to the accounts we gave them of the places we had seen; and then provided us with good beds, on which we were glad to repose our weary limbs.

On the 26th, in the morning, looking out of a window, we saw the creature called ziraphus, the tallest animal I had ever beheld. Its skin was all over white and brown, and its neck almost two fathoms long; its head was a cubit long, and its eyes were bright and lively; its breast was upright, and its back low; it could eat bread and fruits, with any thing else we threw to it. The same day we saw an Indian ox, which some sailors had brought down the Red Sea from the coast, on the east of Babelmandel. The body was shorter, but the head longer than any of ours, the horns were large, not sharp-pointed, but blunt and knotty. The whole of the 27th and 28th days we spent partly in sleep, and partly in reading the sacred scriptures.

On the 29th, as we were walking the streets, we saw a Turk crying bitterly, and thumping his breast and head; and having the curiosity to enquire what was the matter with him? we were told, that he had lately given a good sum of money for a house, and after he had been at a great expence to finish and furnish it, a certain Mamluck had violently dispossessed him of it; and beat him only because he begged to have his house restored. To understand what the author means by Mamlucks, it is necessary to observe, that these Mamlucks were the descendants of the first Arabians who embraced Mahometism, and for some time they had great power over the Turks, but that is now restrained, and they are become as one people. But to go on with our traveller's narrative.

These Mamlucks were such cruel enemies to the Christians, that when they laid hold of them, they made them suffer the greatest hardships, such as dragging their ploughs, carts, and such other drudgery, peculiar to beasts. These unfortunate Christian slaves were so numerous in Egypt, that a whole army was composed of them, and sent against the Turks; when one of them in a florid speech addressed his brethren, and told them, that now was the time to regain their liberty, and punish those who had treated them so cruelly. Having with these words inflamed their passions, they returned directly to Alcairo, and were admitted into the king's castle, which they made themselves masters of, and put the king to death, by cutting off his head. They likewise massacred all his servants, and threw their bodies into the river. At last, after they had satisfied their revenge on these, they gave quarter to the rest, and chose a king of their own; but in time they dwindled away. Those who bear the name of Mamlucks in Egypt, are all Christian renegadoes, who having committed some crimes, and being afraid to return home to their own country, embrace Mahometism.

On the 13th day, having a Moor for our guide, we crossed the Nile, and went to view those stupendous buildings the pyramids, so much celebrated both in antient and modern history. They are most surprising structures, built of hewn stones, and were originally designed as burying places for the kings of Egypt. It is the general opinion that they were built by the children of Israel while they were in bondage, but of that we have no certain account.

As this author does not give a proper description of the pyramids, probably owing to his want of knowledge in architecture, we shall speak of them more at large when we come to treat of Egypt and Lybia.

Baumgarten having seen every thing worthy of notice at Mount Sinai, and at Cairo, he and his companions resolved to visit Syria and Palestine, and accordingly made preparations for their journey.

“ On the 6th of December (says he) we left Cairo, and lodged the first night in a small house in Alcairo. We saw there an oven shut up on all sides, with lime and clay, into which they put the eggs of several sorts of fowls, such as geese, ducks, hens, pigeons, &c. which, by the influence of the fire and lime, brought forth living ones, according to their several birds, in a very short time. This is the reason that they have such a vast number of fowls in Egypt, which are of great service to the people in general.

On the 7th, we came to a place called Bebbes, where we joined a caravan going to Damascus, and there we saw a Mahometan saint, sitting among the hillocks of sand, as naked as when he came out of his mother's womb. Upon enquiry, we found he was an idiot; and, to our great surprize, learned that all those who are any way deprived of their reason, are by the Mahometans considered as saints. The only reason that could be assigned for this strange notion, is, Mahomet himself was frequently subject to the falling sickness, and while he continued in a state of insensibility, he made them believe that he was conversing with the angel Gabriel. On the evening of that day we pitched our tents in a most beautiful plain, having a sycamore wood on the one hand, and a stream of fresh water on the other. The prospect over the neighbouring country was the most delightful that could be imagined, especially as every thing was at that time advancing to a state of ripeness.

In this delightful spot we rested the whole of the eighth day, waiting for more people to come up to increase the number in our caravan; which being completed, we set out, there being no less than four hundred armed men, besides our servants and guides. We had likewise a hired guard from Cairo, who arranged our waggons in such a manner, that we might be ready at all times to oppose the Arabs, of whom there were swarms in every part of the country. In the evening we came to a slimy, muddy pool, of which both we and our beasts were obliged to drink; for we could get no other. Here we met with another Mahometan saint; but so far from being an idiot, we found him a cunning, designing cheat. He danced about like a merry-andrew, and sung obscene songs in order to extort money from us; and as there were a great number of Mahometans in the caravan, we thought it best to give him a small trifle.

On the 9th, we came to a village called Salheyo, where the people brought us some excellent fruits, such as melons, cucumbers, and dates, with bread and pullets, which we bought of them at a small expence, and having filled our bottles with a muddy sort of water, we laid down for the night to rest on a rising ground, for we found it dangerous to lay in the plains, lest the Arabs should have come and robbed us; for our guides sometimes fell asleep.

On the 10th, after we had travelled some time through hills and sands, we came to a small town called Cassia, near to which was a wood of date trees, where we lodged that night; for although there were many wild Arabs hovering around for their prey, yet they were afraid to meddle with us when they found how we were armed, and prepared to meet them. Next day, being the eleventh, we entered into a wild sandy desert, and so loose, that it yielded and gave way under our feet; while, in the mean time, we could see nothing but the heavens above, and sand below; for nothing green, no tree, nor the least herb, was within the reach of our sight. In this dismal place we were obliged to rest during the night; and on the twelfth came to a desolate decayed college, where we stopped about two hours, and then went on in a strait course towards the sea. Not far from this college we saw above ten thousand carcases of sheep, goats, asses, and other creatures, lying on the ground, rotten and half consumed; the noisome smell

of which was so insufferable, that we were obliged to make all the haste we could to get out of the reach of it. The occasion of their lying there was this: Amurald, one of the sultan's chief ministers, having been sent into Judea to raise a poll-tax, and finding it hard to collect the money, had driven away the poor people's cattle, with a design to carry them to Cairo, and present them to the Sultan; but as he was travelling through that desert, where there was neither water nor pasture, he lost them all. The sultan having heard of this, and finding what vast influence Amurald had over many of his subjects, began to suspect, that if he should come safe to Cairo, he might at once deprive him of his crown and life. Accordingly he set out to meet him, and before he came near the camp, sent one of his officers to present him with a rich embroidered garment, as a mark of his esteem for his services; and after that he sent him another present of what he called the most delicious liquor, of which Amurald drank, and immediately died, for it was poison; by which means the sultan not only freed himself from a dangerous enemy, but also became possessed of all his treasures.

After we had got clear of the smell of the dead carcases, we lay along the coast, where we found people engaged in making salt; for when the sea at spring tides overflowed the neighbouring country, it filled the ditches with salt water, which, when it ebbed, was turned into salt by the violent heat of the sun. Having travelled all that day and till midnight, we laid ourselves down to rest about two hours, and then continued our journey to another bay, where our guard commanded us to alight from our horses, and pay them a small matter each. Having gained this from all the persons in the caravan except us, they came up and made the same demand; we refused to pay it, telling them, that we had agreed with the mule driver, and paid him for all these expences, at the same time shewing them his hand writing as a proof of it. The guard seeing us in confusion, had compassion on us, but it was like to have gone hard with the mule driver; for they went up to him, and would certainly have massacred him, had he not given them back the money which we had paid him. This did not grieve us much, for we had been so often cheated by these drivers and guards, that we knew not where it would end.

On the 14th, about sun-set, we drew near to Gaza, where our mule driver had a house, and there we staid two days; we hired one David, a Jew, to be our interpreter, and he advised us, for our own safety, to purchase such dresses as are worn by the natives of the country. He added, that the cheapest and coarsest would be the best, and then we would be freely permitted to go in and come out in any place without having questions asked us. Had we attended to this before, we should have avoided many dangers we ran into; but how was it possible for us to know?

Gaza is so well known in the history of the Old Testament, that we need not say any thing concerning what it was in those times. At present it is a large place, containing a vast number of inhabitants, being more extensive than Jerusalem, but it is not fortified. It is called by the Turks Gazazel, which signifies a treasury, because when Cambyfes, King of Persia, went into Egypt, he made this the storehouse of all his riches and warlike preparations. It is finely situated, and encircled by the most delightful gardens, producing almost all sorts of delicious fruits. Here is still to be seen the Temple of Dagon in ruins, there being only some part of it left standing. The remains consist of a few pillars, which are kept standing, in order to perpetuate the memory of Sampson's having pulled it down, and destroyed both himself and the Philistines.

About a mile from this city, towards Hebron, stands the hill where (as the people told us) Sampson carried the gates of Gaza during the night. Here we rested one night, and in the morning continuing our journey towards Jerusalem, we soon came to a small village,

where we refreshed ourselves and our mules, because the road we had to travel over was very bad and rugged. Departing from thence, we travelled all night for fear of robbers; and because the road was steep, rugged, full of wood and dens, we were obliged to rest in a valley between two rocks to refresh ourselves and our horses, being almost fatigued to death.

On the 18th, travelling between the rugged and broken tops of the hills, we saw some refreshing herbs, which we pulled and eat, and after much fatigue we got into a good road. Here we filled our bottles with water, and the people who lived in the villages sold us bread, for what we had was as hard as a stone. At last we came to Hebron, where we were used very scurvily by the Turks, who refused at first to furnish us with any necessaries, but partly by persuasions, and partly by gifts, we prevailed upon them, and were permitted to lodge in the house and garden of a poor old widow.

On the 19th, we went under the conduct of our interpreter, the Jew, with a Turk for our guard, to see those places mentioned in scripture. The first that presented themselves to our view, were the three fountains of the patriarchs, Abraham, Isaac, and Jacob. A little further we came to a field, where we were told, Adam was made; but that does not in the least agree with the account laid down in the Book of Genesis, or the description there given us of the Garden of Eden.

This field lies about a mile to the west of Hebron, and the earth of it is reddish, and feels almost like wax. The Turks make little balls of it, which they sell to the Christians to make their prayer beads of. The Turks export great quantities of this earth every year into foreign countries, pretending that no noxious animal will come near where it is. It was near this place, where the people shewed us the cave of Machpelah, where Abraham buried his wife Sarah; where Isaac and Rebecca were buried; where Jacob and Leah were buried; and where at last the bones of Joseph were deposited, after he had been dead above two hundred years.

During the time of the Greek Emperors a stately church was built over this cave, but the Turks have now turned it into a mosque; however, these Turks have still a veneration for the place, for when any of their people are not able to visit Mecca, where their prophet is buried, they are permitted to visit this cave at Jerusalem; but no Christian is permitted to enter within the walls of the mosque. About a mile from modern Hebron, stands ancient Hebron, or rather the ruins or rubbish of it, for there is not one building left. Here David reigned seven years before he made himself master of Jerusalem, and here the tomb of his father Jesse is still shewn. About half a mile from old Hebron is the valley of Mamre, where God appeared to his servant Abraham when he was sitting at the door of his tent, where he saw three; but worshipped only one. Just as we intended to have left Hebron, a Turkish magistrate came and by force took away our mules to carry his baggage to Damascus.

After this, we fought up and down, and at last found two, on which we laid our things, and walked behind them on foot. We had only travelled a little way when a Turk came up and took an afs from one of our company. A poor aged Jew who had been taken ill on the road was riding upon a horse; and the Turk having ordered him to dismount, the poor creature begged hard and offered the wretch money, but all to no purpose; for although the Jew was in all appearance in a dying condition, yet he threw him off from his horse. At last our mule drivers interceded for him with the Turk by giving him money, and the Jew had his horse again; but was so much wounded that he could not mount the horse again till two helped him up. Continuing our journey, we came to Bethlehem, famous for the birth of our Saviour, and were kindly entertained by the poor people of the town. Having had a good night's rest, we got

up in the morning and went to the church dedicated to our Saviour, which, while it was in its glory, was reckoned the grandest in the world. It was built of white marble, finely adorned; and supported by twenty-two lofty pillars, which made a grand and solemn appearance.

Although in ruins, yet there was enough remaining to point out something of its ancient grandeur. We saw between the chapters of the pillars many pieces of scripture history, curiously carved in marble, and set off with such a becoming gracefulness, as even exceeds description. In Bethlehem we were shewed the stable where our Lord was born, which was converted into a chapel, so that none of the old building could be supposed to be standing. There is no manner of doubt but this chapel is built on or near the place where Christ was born; for although the primitive Christians took no notice of one place being more sacred than another, till after the time of Constantine the Great, yet we may naturally suppose that as there were many Christians in Palestine, so the memory of the event; and the spot where it happened, would be equally transmitted down by tradition. They shewed us the place where the manger stood; the table on which the circumcision was performed; and the place where the wise men stood, when they made their offerings. Having viewed all these things, we proposed to go forwards to Jerusalem, and the two friars were so obliging as to favour us with their company.

We passed by the sepulchre of Rahab, of which there are now scarce any remains; and soon after we came in sight of Jerusalem. No sooner did we see it, than we fell down on our knees to return our thanks to that gracious Being who had protected us in the midst of so many dangers, and conducted us safe in body and mind.

All that is recorded in scripture concerning that once celebrated city, came fresh into our memories; and we could not help lamenting the fatal effects of civil discord, which has now laid it in ruins.

We went up to Jerusalem by the valley of Hinnom, where the idolatrous Jews offered their children in sacrifice to the pagan idols; and where, after the captivity, all the filth of the city was thrown, and since kept constantly burning to consume it; so that it was considered as a lively emblem of hell. Our two friars took us into the monastery that stands on Mount Zion, where we were kindly treated, and presented with every necessary refreshment. The same day, towards the evening, the keeper of the holy sepulchre, whose name was Abraham, finding that strangers had come to Jerusalem, waited on us, and told us what were the fees we must pay in order to see all things remarkable in the tomb where our Lord was buried. As we had letters from the sultan of Egypt, and likewise from Tongobardine, we thought to have been excused paying the fees; but we found ourselves mistaken, for nothing but paying would open the gate. However, the poor monks who receive this money, are not to be blamed on the score of avarice, for the Turks extort the greatest part of it from them; and if they could not, or refused to satisfy their rapacious demands, they would be in danger of losing their lives.

Next morning, about sun-rising, we went into the holy sepulchre, accompanied by all the monks of Mount Zion; and at the door we found Abraham the keeper, accompanied by a great number of Turks, who waited for us. Abraham having written down all our names, set open the door; and as soon as we had entered, he shut the door on the outside. All the monks were dressed in their robes, each having a taper burning in his hand; and when they had done singing their litanies, they proceeded to shew us all the curiosities of the place.

As there is a church built on this spot, it takes up a considerable space of ground, but it is impossible that all the events recorded in the gospel concerning our Saviour's crucifixion could have happened

within so narrow a compass; but the monks endeavour to make people believe so.

The first thing they shewed us was the marks of the earthquake in the rock which happened at the time of Christ's crucifixion, and a part of the pillar to which he was bound, when they scourged him, inclosed within rails. Here were several small chapels, but none of them contained any thing worthy of notice. At last we came to the chapel of the Holy Sepulchre, into which we entered by a little, low door, not above two cubits high. It was lighted with thirty-eight lamps, which served to inspire our minds with something of a solemn awe, leading to a contempt of worldly things. The figure of the sepulchre is square without, and at each of the corners are six pillars, so high, that they support a cover above the roof of the chapel. Above this room there is a little room supported by six pillars; and above these pillars is a little gilded arch in the shape of a globe. The church, in the middle of which the chapel stands, is open above as wide as the chapel is large; so that the Holy Sepulchre may be said to be in the open air.

We continued all night in the Holy Sepulchre, adoring our God; and in the morning the door-keeper came to call us out; we obeyed his orders, and returned to the convent on Mount Zion, where we reposed ourselves. The rest of the day was spent in viewing every thing worthy of notice in the city and its environs. Under the wall of the city, and near where the temple stood, we came to the brook Cedron, which runs through the middle of the valley of Jehosaphat. It is dry in summer; but in the spring the waters are level with the banks. Over this brook there is an arched stone-bridge, built by Helena, the mother of Constantine the Great; and at the further end of it is the sepulchre of Jehosaphat, king of Judah, which gives name to the valley. The sepulchre is hewn out of a solid rock, with a spire on the top; and adjoining to it is the tomb of the prophet Zacharias, hewn out of the same rock. Near these they shewed us the tomb of Absalom, well known for rebelling against his father David; but the Turks have thrown so many stones into it, that it appears like a heap of rubbish. From thence we entered into the valley of Gethsemane, where our Saviour's passion begun, and where he was apprehended by the officers at the command of the high priest.

In the middle of the valley of Jehosaphat we were shewed the church of the blessed Virgin; which is so low, that we descended to it by thirty-eight steps. In the middle of the church stands her sepulchre, made of white marble, and is much larger than that of our Lord's, having two doors to it, opposite to each other; and here they told us her body was deposited. From thence we went to Mount Olive, which is directly opposite to the east of the spot where the temple stood; from the top of it is an extensive prospect over the Dead Sea, and part of the desert of Arabia. Coming down that side leading to the Dead Sea, we passed the village of Bethphage, from whence the monks make a procession every Palm Sunday, in memory of Christ's entry into Jerusalem. These poor monks are used but in an indifferent manner by the Turks, who laugh at them during the whole of the procession; but they are obliged to arm themselves with poniards. Bethan, where they shewed us the tomb of Lazarus, raised from the dead, is now a poor contemptible village, although it was formerly a place of considerable strength, if we may believe Josephus. The Turks pay great veneration to the tomb of Lazarus; and there is a flag constantly displayed on it; otherwise it contains nothing worthy of notice.

Near this place they shewed us the house where Simon the leper resided; but it consisted only of a pile of ruins. It seemed to have been built of hewn stone, and surrounded by a ditch, which was the ancient form of building private houses in that part of the country. The reason is obvious; they were in continual danger of being robbed, and therefore it

was necessary that they should secure themselves as well as possible. Returning to Jerusalem, they shewed us the trunk of the tree upon which Judas hanged himself; and near it is the burying place of the Jews, fenced in with a stone wall. The Jews have such a respect for Judas's tree, that they almost adore it; which may serve to shew what bitter enemies they are to the Christian religion. In the evening we returned to the monument, where we refreshed ourselves, and had a good night's rest.

Next morning we began a second perambulation round the city; and the first place we came to was the pool of Siloam, where Christ restored the blind man to sight. Near to this is the well of the same name, where clear water is incessantly boiling up. Acedama, the field bought with the thirty pieces of silver, is near this place; but the empress Helena caused it to be inclosed with a stone wall, ordering that the dead bodies should be let down into it by ropes.

A little to the eastward of this we came to several caves cut out of the rocks, but for what purpose does not appear; probably they were cut out in antient times, for the people to conceal their goods in during a siege. They told us, that it was here the apostles concealed themselves during the time of our Saviour's passion; which is not in the least improbable, although there is nothing in support of it but oral tradition. Here we saw a way of catching birds, different from any thing we had seen before. They poured water on a rock, and this being a dry, hot country, the poor birds while flying in the air, ready to drop down with thirst, seeing the water shine so clear by the bright beams of the sun, fly straight down to it, and, before they are aware, are caught in the gins. By the time we had seen this sport, we found ourselves hungry, and therefore proposed returning to mount Zion; and after dinner went to view the place where the temple stood. Indeed all we could see, was the place where it stood; for, as our Saviour had foretold, not one stone has been left upon another. The Turks hold this place in great veneration, having walled it all round; and they will not suffer any Christian to enter without giving them money.

If any Jews or Christians go into it without permission, they are immediately put to death; of which the following may serve as an instance: some few years before we visited the place, a Greek christian dressed himself in the habit of a Turk, and went within the inclosure; but being detected, was obliged to turn Mahometan in order to save his life. However, his conscience checked him, and he recanted; for which he was brought before the gate of the Holy Sepulchre, and cut in two in the middle. Near the temple is a church covered with lead; and while the Christians were masters of Jerusalem, it was dedicated to the Virgin Mary. At present it has a mean appearance, but lamps are kept continually burning in it. We were credibly informed by one who had accompanied us to Damascus, that within the precincts of the temple there were magnificent and costly buildings, so large, that several thousands of men could have lodged in them. We were next shewn the houses of Pilate and Herod; but although the buildings we saw may have been erected on the same spot where those persons lived, yet as the city of Jerusalem was totally destroyed, consequently we look for the antient ones in vain. There are some of all Christian sects to be met with here, besides Mahometans, but they never quarrel concerning the principles of their faith.

The whole country around the once luxurious city of Jerusalem is now extremely barren, but it was not so formerly; for we are well assured, that it was once extremely fertile."

What this author says, concerning the ancient fertility of Judea, shall be taken notice of afterwards, from the accounts of those gentlemen who have visited it within these few years; for our design is, to represent nations what they were, and what they are. For

without this no knowledge can be had of the antient and modern state of the world. But to go on with the narrative: "On the 28th in the morning we walked round mount Zion; and the monks, our guides, conducted us to see the desert of John the Baptist, where we went into a cave, and drank of a cooling stream. This cave is in the hollow of a rock, and it is difficult to determine whether it is natural or artificial. Here we were presented with one of the finest prospects in the world towards the hills and the vallies around us. From this place we went southward, where we encountered with very high and steep mountains, and having got to the top of one of them, we marched down on the other side, where Philip baptized the eunuch. At this place, on the top of a hill, we saw the ruins of Ziklag, which the king of the Philistines gave to David to reside in.

It being now towards evening, we made the best of our way towards Bethlehem, where we arrived just as it began to grow dark, and staid there all night along with our guides. This was antiently called the City of David, but now it is only a poor village, about six miles south of Jerusalem, on the road leading to Hebron. It is situated on a high narrow hill, running from east to west, but has nothing in it remarkable except what we have already mentioned. Next day we returned to Jerusalem, where, having refreshed ourselves, we set out for Jordan, accompanied by a Turkish guide, and our interpreter. We passed by the well of Elisha, and having taken some small refreshment, tied our mules to trees, and went on to visit Jericho. Jericho is situated in the middle of a valley, near the Dead Sea. It was famous of old for its gardens; and, at the same time, infamous on account of the abominable crimes committed by the people. It was taken and destroyed by Joshua, but afterwards rebuilt, and seems to have continued till the time of the Romans, when it was totally destroyed by Vespasian. At present it is no more than a contemptible village, inhabited by a few Turks; and, instead of fine gardens, which it had formerly, there is nothing to be seen besides barren deserts.

On the third day, having followed our guide, we arrived at the Dead Sea; and in our journey thither had a view of that horrible place where God inflicted his judgments on the Sodomites for their unnatural abominations. The land round about this place is filled with pits, covered over with ashes that seem quite soft. It seldom produces any thing green, but looks black, as if it had been scorched with lightning. It is full of pits and holes, into which our mules stumbling, and throwing us upon the ground, gave us occasion sometimes to laugh, and sometimes to pity the poor creatures. It had rained for several days before we came there, so that the ground was soft and spongy. When we approached the shore of the Dead Sea, we tied our mules to shrubs, and attempted to get near the water; but the poisonous smell was such, that we could not bear it; and it brought to our remembrance the great judgments of an offended God. On the right hand of the Dead Sea lies the city Segor, a place desolate and melancholy like the rest; and here it was that Lot retired with his daughters, after Sodom and Gomorrah were destroyed. It was then called Zoar, but the Turks have given it its present name. Near this place are the ruins of a convent, which goes by the name of St. Jerom; and it is reported that that great man lived and died there.

We came next to the streams of Jordan, and to the place where it is said our Saviour was baptized; and not far from this is the place where the children of Israel passed over on dry ground. After many windings and turnings it falls into the Dead Sea near Jericho, and there it is swallowed up. From Jordan we returned to Jerusalem, to visit the Holy Sepulchre once more; for in consequence of the money we had paid at first, we had a right to visit it a second time. But Abraham the keeper refused to admit us, unless we would give him a fresh sum. This we complied with,

with, and having satisfied our curiosity, we hired mules to carry us to Damascus; but the driver not having them ready so soon as we expected, we were obliged to wait some days longer.

December the 20th, the governor of Jerusalem having apprehended twenty-eight robbers, caused their heads to be cut off, and carried on poles before him in triumph, when he entered the city. Our mules not being yet ready, we went to Emmaus, which is only a small village; and on Christmas-eve we went to Bethlehem, and were present at vespers. Here we met with all sects of Christians from almost every part of the known world; and many of their ceremonies were ridiculous enough.

December the 28th, the mules we had looked for so long, came at last, and about noon we began our journey towards Damascus. We continued travelling towards the banks of the River Jordan till evening, when we took up our lodging at a village called Galgala, where we met with a great number of travellers. We rested well that night, and in the morning prepared to set out on our journey; but our mule drivers falling out, some insisted on going one way, and some the other. At last we contrived to pacify them, and continued our journey over horrid rugged mountains, where we expected every moment to be dashed in pieces. After this, we arrived at a large valley, through the middle of which Jordan runs; and there we rested and refreshed ourselves and our mules till sunset, being much afraid of robbers.

As soon as it was dark, we left that place, and proceeded on our journey in the quietest manner possible, till we got to the north side of the valley; but here we had new difficulties to encounter. Both sides of the river Jordan were lined with robbers, which we could easily discover by the number of fires we saw; we were reduced to such straits, that we knew not what to do; for whether we went forward, or returned backward, the danger was the same.

While we continued in this state of suspense, we committed ourselves to the care of Divine Providence; and in the mean time took hold of some boys, whom the robbers had appointed to watch. But no sooner had we apprehended them, than they set up such a shout, that we gave ourselves up for lost; and so leaving off our intended journey, we turned aside to a hill with all the speed we could, intending to sell our lives as dear as possible.

In the mean time, while the robbers were drawing together into a body, we got to the top of the hill, being favoured by the darkness of the night, and from thence descended down into a valley, leaving scouts behind us, to give us an account of the approach of the enemy.

In the morning, our scouts returned, and brought us word, that they could not see any of the robbers, and they brought along with them an Arab, whom we hired to conduct us to the river Jordan. When we came to the shore, we found it guarded by a vast number of Arabs, who had the insolence to demand a toll before they would suffer us to pass. The river was at that time very shallow, so that we waded over it and came to a Greek convent, where, although the monks were poor, yet they treated us with the utmost hospitality.

We rested on New-year's-day, and were next morning joined by some more persons who were travelling the same way with ourselves. We travelled together all the second of January, and in the evening came to a small village, where the houses were like cottages. There we lodged that night, but were so straitened for want of room, that we were glad to take up our abode among the camels and mules. January the 3d, we left these mountains, and entered a large plain, where were no trees; but the ground was extremely fertile. At the end of the plain we came to another small village, where we rested ourselves two days, for our company was yet too small to venture further. The houses in this part of the country are miserably low and mean, built in ditches, the outside being of stones without any mortar.

On the 6th of January, a caravan of seventy camels came up loaded with corn, which they were carrying from Galilee to Damascus. We joined ourselves to this caravan, and the next inn we came to we met another full as strong as the former; so that we pursued our journey with cheerfulness.

On the 7th, we passed the Lake Maron, which is formed by the streams which flow down from Mount Libanus, about the beginning of the spring, when the warm west winds thaw it; and yet that same mountain is scorched up with heat in summer. Because of the overflowings of the water, there grow here abundance of reeds, trees, and thorns, which make a sort of an echoing wood, where the bears, lions, and other beasts of prey, find both food and shelter. Next day we travelled over a fine country to Damascus, and arrived in that celebrated city late in the evening. We went directly to the factory belonging to the Venetians, who received us with all manner of civilities, and entertained us nobly, so that we wanted for nothing. We had soft feather-beds to lie on, all sorts of meat in very good order, our feet and heads washed, and our linen shifted. In a word, we were treated in such a manner, that we almost forgot all the hardships we had suffered. Next day we waited on the consul, who treated us in the same manner as at the factory.

On the 10th, we were conducted out of the city to see the place where Saul, whom we call Paul, was converted. There was formerly a church built on the spot, but it is now thrown down, and the ground is used as a burying place for the Christians of Damascus. Returning through the gardens, with which the city and country abounds in great variety, we came under the walls of the town, and directly under the window where Paul was let down in a basket by the disciples.

Having entered the city, we were shewn the house where Judas dwelt, who entertained Paul while he was travelling; and the house of Ananias, in which some Christians dwell, and near it is a pretty chapel. Whilst we were viewing the city, a noble Venetian, who, accompanied us with some Turkish gentlemen of Damascus, entertained us with the following narrative.

A Florentine merchant, having resided many years at Damascus, acquired great riches, and became intimately acquainted with the prince of the country, before it was subdued by the Turks. The prince told him, that if he would renounce his religion, he would give him his daughter in marriage. The young princess was extremely beautiful; and the Florentine, blinded by love, consented to the bargain, renounced Christianity, and married the princess. This marriage brought him into great esteem, and he was much respected by all the courtiers. After the prince his father-in-law's death, the Florentine succeeded him, and reigned many years in much honour among the people, who, after his death built a mosque to perpetuate his memory.

This city, for wholesomeness of air, plenty of water, fruitfulness of the soil, variety of most delicious fruits, pleasant orchards and gardens, flourishing trade, and lastly for its antiquity, far excels all other cities in Syria. It is situated at the foot of the Mountain Antilibanus, in a plain watered by the Rivers Pharphar and Albana; insomuch, that it may be justly stiled, a Terrestrial Paradise. Among other fruits that grow here in great abundance, are the Damascene prunes, so called because they were first brought from Damascus to Europe. In one part of the city we saw a house, in which no creature resided but cats, and they were suffered to breed as they pleased, from time to time, in memory of a cat whom Mahomet left there, when he visited Damascus.

We intended to have seen many stone monuments of antiquity at Damascus, but fortune was unfavourable to us; for as we had been conducted from one place to another by our countrymen, the prince was informed that we were persons of rank, and that we ought to have waited

waited on him, as he would have treated us with the utmost respect; we learned, however, that this prince was of an avaricious disposition; and that all he wanted, was to extort money from us. Our consul was no stranger to his temper, and therefore went and told him that we were only poor merchants, who had come there to buy goods; and he being acquainted with us in Italy, could do no less than treat us in the manner he did. The prince seemed to be satisfied; but the consul let us know that we had best get out of the place as soon as possible, lest some evil should happen to us. This was too good advice to be slighted, and accordingly we packed up our goods, and left Damascus about three o'clock in the morning, while the moon shone bright, and at day break arrived at a small village, where we found a caravan going to Baruthum.

To this caravan we gladly joined ourselves, and travelled over mountains covered with snow the greatest part of the day. Towards the evening we came into a spacious plain, watered by two branches of the river Jordan, which we passed over. This plain is called Bakar, and is surrounded with hills, on which are several antient castles, probably built during the time the children of Israel were at war with the Syrians. The natives have a prediction, that it was here Noah built the Ark, but that is neither more nor less than conjecture.

In every part of this valley we met with vast numbers of monuments of antiquity, such as the ruins of temples, tombs, stones set up like some of those Druidical ruins found in Germany and other parts of Europe, and several prospects of antient castles. At the end of the valley we came to a village inhabited by Mahometans, where we rested two days; and on the morning of the 16th, renewed our journey over dreadful mountains and steep precipices. Here the cold wind drove the snow in our faces, that it was with much difficulty we could sit on our mules. There had been a great fall of snow which had covered the roads; so that it was extremely difficult for us to find our way.

In this wretched condition we arrived at the summit of a very high hill, and then descended by a steep way; but it blew so hard, and rained so fast, that we were almost wet to the skin. Here we were glad to betake ourselves to a small cottage, where we made a little smoky fire, and dried our cloaths in the best manner we could.

The Turks, who resided here, treated us with great hospitality, so that we had no reason to complain; and, indeed, in most respects, we were better entertained than we expected.

January 17th, we intended to leave our cottage, but there came such a terrible storm of hail, thunder, and lightning, that we could not possibly stir from the place we were in. Thus we were obliged to spend the whole day in disputing with some Jews in our company concerning religion; and, having made a fire of green wood, were nearly blinded by the smoke, till our mule driver got some dried wood, which made a fire more agreeable.

On the 15th we left this place, and continued our journey through the snow, and over mountains of ice, till we came to Baruthum, where we were very kindly received into a Venetian house; here we refreshed ourselves, changed our cloaths, and dried them by a good fire.

The whole face of this country in the plains is so beautiful, that one is apt to consider it as a real terrestrial paradise; and what makes it the more agreeable, is the sudden transitions from the severity of frost and snow, to the beauties of summer. Here are whole fields of almond and olive trees, with a thousand other delicious fruits, which do not grow in Europe. To see such agreeable objects after so much fatigue, afforded us a great deal of pleasure, and filled us with admiration. The beauty of the scene, or rather the novelty, was heightened by the contrast; for, looking to the hills, we saw them all covered over with snow.

The musa or plantane tree grows here, and if we believe the inhabitants, this is the tree that bore the forbidden fruit, of which our first parents eat. The fruit of this tree is of the figure of a bean, but much larger; having a sweet smell, and tastes like honey. They grow in clusters like grapes; and when it is cut, a cross appears in it."

Thus far we have followed this ingenious traveller, and shall now proceed to enlarge our account of those parts of Asia, from the writings of several learned gentlemen of our own country; and by that the reader will know both its antient and modern state:

The first, and indeed the most important object that presents itself to our view, is Palmyra, situated in the descent between the Mediterranean and the Euphrates; and famous, not only on account of its stupendious mines, but likewise for many very important events which have taken place in it. But whatever the antients knew of this celebrated place, shall be taken notice of afterwards; and, in the mean time, we shall go on with the account of it as written by the late learned and ingenious Mr. Wood, under the auspices and encouragement of his late majesty, George the II. and supported by that great statesman, Mr. Pitt, afterwards Earl of Chatham.

Our company of travellers consisted of Mr. Dawkers, Mr. Wood, Mr. Bouviere, and an Italian gentleman, well acquainted with antient and modern history, with the liberal sciences and fine arts.

These learned gentlemen spent the winter at Rome; and in the spring, as soon as the season would permit, they found a vessel waiting for them at Naples, in which they embarked, and were conducted as far as the Hellespont, which they went on here, and travelled over the lesser Asia, taking notice of every thing curious.

There is no part of a tour to the east, (says Mr. Wood) so difficult as a journey to Palmyra, because it lies in the desert, far out of the common road, and beyond the protection of the Grand Siegnior. However, we were determined to encounter all the difficulties that presented themselves, and to set out either for Aleppo or Damascus.

Having in vain endeavoured to get to Aleppo, we landed at Byroat, on the coast of Syria, where disembarking, we travelled to Damascus by the way of mount Libanus, which we crossed over. Here we learned that neither the name nor the power of the Bashaw of Damascus could be of any service to us, Palmyra being out of his jurisdiction, and under that of an Aga, who resided at Hassaia, a small village seven days journey north of Palmyra.

Hassaia lies on the great common road from Damascus to Aleppo, and near it is the Orontes. Here we met with a hospitable reception from the Aga, who expressed himself much surprised at our journey, but furnished us with all sorts of necessaries. He ordered a body of Arabian horsemen to conduct us, and these men were armed with guns and long pikes. In four hours they brought us to Sudud, over a desert plain, where we saw no sort of animals but antelopes.

Sudud is a poor village made up of cabbins, with mud walls, hardened in the sun, and the inhabitants are chiefly Muscovite christians, who cultivate no more of the land than is necessary for their subsistence; but they make tolerable good wines.

Here we dined along with a Muscovite priest, from whom we purchased some Greek manuscripts, and then proceeded to Howareen, a poor Turkish village, although by its ruins it appeared to have been formerly a place of considerable repute. Besides the ruined walls, there were the remains of several churches, which, from the architecture, seemed to have been built about the time of the Greek emperors; but not so long ago as the age of Justinian. It is true, the architecture does not appear regular, but this must have been owing to some parts of the buildings having been patched up from time to time, for we saw both antient and modern art joined together. So far as we could judge, these churches had been erected with more profusion of

idle fancy than genuine taste; for there were so many unnecessary decorations, that the architect could have no knowledge of the beautiful and sublime.

From hence to Carieteen the distance is about two hours journey, keeping upon a southern direction. This village is rather larger than the last; and here we saw broken columns of Corinthian pillars, with Greek inscriptions upon them; we rested here the greatest part of the second day of our journey, in order that we might collect together as many travellers as possibly we could. By this delay so many people joined us, that we were able to make up a complete caravan; so that we were not much afraid of robbers. Next day we set out from this place, across the desert, but were obliged to travel two days without either rest or water; and, to make our circumstances the worse, though it was so early in the season, the heat of the sun reflected from the sand, and there was not a fresh breeze of wind to comfort us; so that we really imagined we should have perished. Our company consisted of about two hundred persons, besides a vast number of camels, asses, and mules; our guides told us, that this was the most dangerous part of the road; and therefore we were obliged to send out scouts before us, to spread the alarm, in case any of the Arabs should be coming.

The road here was nearly north-east, through flat, sandy plains, about ten miles broad, bounded on the right and left by barren mountains, that seemed to run within two miles of Palmyra. Nor are there in the whole of this plain either trees or water; but the gloominess of the prospect was, in some measure, compensated by our Arabian horsemen, who, in order to divert us, often engaged in mock fights, wherein they shewed themselves great masters of horsemanship. All night we sat ourselves down in a circle; after having regaled ourselves with coffee and a pipe of tobacco: one of the horsemen diverted the others with a song in their own language, but we did not understand whether it alluded to war or love. There are several broken pillars in this desert; but they are so scattered from place to place, that we could not distinguish to what temples they had formerly belonged; only this much is certain, that there must have been once a magnificent structure here, probably built about the time the Romans carried their conquests into this part of the world.

At midnight the caravans rested, in order to take a little refreshment; and on the 14th of March, about noon, we reached the end of the plain, where the hills seemed to meet. Here we found a vale, through which runs a ruined aqueduct, that formerly conveyed water to Palmyra. The sepulchres of the antient inhabitants were on each side of the vale, being square stones of a considerable height.

Having passed those antient monuments, a sudden opening among the hills discovered to our astonished eyes, a most amazing quantity of magnificent ruins of white marble, and beyond them a flat waste, stretching all the way to the Euphrates. No prospect can be imagined more striking and romantic, or more grand and melancholy, than such innumerable piles of Corinthian pillars, without any intervening wall or building of the least solidity. There cannot be a greater contrast than that which subsists between these stupendous ruins of grandeur and the mean huts where the Arabs live, and where we were lodged. Both men and women here are well shaped; their complexions are swarthy, but they have something in their features very agreeable.

They wear in their noses and ears, rings of gold or brass, according to the nature of their circumstances; the colour of their lips is blue, their eyes and eyebrows black, and the tips of their fingers red. The female sex, though veiled, are not so reserved as most other eastern women, being easily prevailed upon to throw aside the covering. Both sexes are very healthy, being so accustomed to regularity in their way of living, that they are almost, in all respects, strangers to sickness or disease. They have seldom any rains

but at the time of the equinox; and the sky, during our stay there, was beautifully serene; except once, when it was much darkened by a whirlwind of sand from the desert, which preceded a shower of rain, and gave us a small idea of those dreadful hurricanes that have been often known to overwhelm not only caravans, but even towns and villages. We remained in this place fifteen days; and, during that time, the Arabs supplied us with mutton and goats flesh; but had we staid much longer, those articles would have been scarce.

Geographers differ in their accounts of the situation of Palmyra; which is owing to their taking all their materials from old authors. It is situated at an equal distance between Aleppo and Damascus, being about six days journey from either; reckoning twenty-four miles for each day. The walls, which surround this city, were flanked with square towers in many parts, particularly on the south-east; but nothing of them now remains; and from the best computations we could make, the circuit could not be less than three English miles, including the great temple. But as the city of Palmyra must, when in its flourishing state, have been more than three miles round, it is probable the old city covered a large spot of ground in the neighbourhood, the circumference of which is ten miles; and the Arabs told us, that many ruins were frequently dug up there. This is a very reasonable supposition, for the buildings stood here formerly; nor can it be supposed, that ruins would have been removed. Perhaps, then, the walls, of which we have just now spoken, inclose only that part of Palmyra which its public buildings occupied in its more flourishing state; and were either erected or fortified by the emperor Justinian, to stem the furious ravages of the Saracens: so that, from a rich trading city, which it once was, we shall find that it was reduced to a frontier garrison.

By clearly inspecting the wall, it appeared, that three of the flanking towers on the north-east had been formerly sepulchral monuments. And this is some proof that the walls were built during the reigns of the Christian emperors; for the Greeks and Romans always buried their dead without the walls of their cities; and the same custom was observed by the Heathens in all parts of the east. A little to the north-west of Palmyra is a rock, the ascent to which is steep and rugged, and on the top is an old castle. This is a neat structure, of no great antiquity; and round it is a ditch, which is very difficult to cross, the draw-bridge having been broken down. In this rock there is a deep hole, which seems to have been cut out for a well, but it is now dry. We have several accounts of the time when this castle was erected, all differing from each other; so that no regard can be paid to them. The most probable conjecture we can form is, that it was built by the Arabians long after the time of Mahomet, for there is no sort of elegance in the architecture; and it is well known, that neither the Arabians nor the Turks have any taste for building.

From this castle we had an extensive view of the deserts, which, at a distance, looks like the sea; to the south, and on the west, we could distinguish the top of mount Libanus. There is one building here, the remains of which are very magnificent; and this, we believe, was the Temple of the Sun, which the Roman soldiers damaged in the reign of the emperor Aurelian. That emperor seized on all the treasures of queen Zenobia, which amounted to eight hundred pounds weight of silver, besides the jewels of the crown; and three hundred pounds weight of that silver he ordered to be given to repair the city and temple. The solidity and height of its walls induced the Turks to convert it into a place of strength; having demolished part of the wall and the temple, and built some towers on the ruins. The centre is paved with broad stones; but they are sunk so deep, that it is difficult to perceive them. To the east of the temple are several olive-gardens and corn-fields, inclosed

inclosed by mud walls; for it is very remarkable, that the wild Arabs seldom come into this part of the country; otherwise there is no doubt but they would destroy what has been still left, as the venerable remains of antiquity.

Near the city are two streams of fresh water, which by the inhabitants are considered as medicinal; but we could not find any of that quality in them. The most considerable of these streams rises a little west of the ruins, in a grotto, almost high enough to admit of a man standing upright. The whole bottom is a basin of clear water, about two feet deep, and that place is used as a bath. From it there runs a small current, through a channel three feet wide, and one foot deep; but after a short course it is lost in the sand. By an old inscription found here, was another stream sacred to Jupiter; we learned that this stream was much esteemed while Palmyra flourished; it being under the care of certain persons appointed for that purpose.

The other stream not only contains the same quantity of water, but after running for some time through the ruins in an antient aqueduct, joins the first stream, and loses itself in the sand. As we have no reason to imagine that these streams of water at Palmyra have undergone any material alteration in their course, we are surprized to find that none of the English merchants, who were formerly here, ever made any mention of them.

The town, as appears from history and tradition, was, however, well supplied with water, conveyed to it through an aqueduct; and some are of opinion, that it was from the mountains of Damascus. It was built wholly under-ground, and had openings in several places to keep it clean. Here are still several inscriptions upon it, in the language of Palmyra, but none of them are legible. The valley of Salt, whence Damascus, and the neighbouring towns, are supplied with that commodity, lies in the desert, three or four miles south-east of the ruins of Palmyra.

In this place David is supposed to have smote the Syrians, as mentioned 2. Sam. chap. viii. ver. 13. The earth is impregnated with salt to a considerable depth; and here they have a way of making hollow places in the earth, of about a foot deep; and from the rain-water, which lodges here, a fine white salt is extracted.

The present grand magnificent ruins of Palmyra naturally lead us to consider what was its state in antient times; and we shall endeavour to throw some light on that part of history which has been too much neglected. It is not a little strange, that history scarcely furnishes us with any information concerning this celebrated place, except such as is merely conjectural; and yet we no-where find such noble monuments of antiquity, of which we have little knowledge, except what we are supplied with from inscriptions. Does not this event convey instruction, and convince us of the emptiness, the vanity, and the instability, of human grandeur? Balbec and Palmyra come under this description; for we have little left concerning them, besides inscriptions and their stupendous ruins; while though a single stone does not constitute the ruins of Babylon, Nineveh, or Troy, yet we read their histories every day. This chasm in history may be owing to the loss of books; or, perhaps, these grand buildings were not much regarded, as there were thousands at that time in the world more elegant and more stupendous than they. If the latter be a true state of the case, is not our admiration of their defect very excusable? May not their silence concerning Balbec, justify what they have said concerning Babylon? and their not mentioning Palmyra be a sort of proof of the magnificence of Greece?

We read in 1 Kings, ix. and in 2 Chron. viii. that Solomon erected a city in the wilderness, and called it Tadmor; and we are told by Josephus, in his Jewish Antiquities, that the Greeks and Romans distinguished it by the name of Palmyra, even whilst its first name was retained by the Syrians. And this

is confirmed by St. Jerome, who says, that Tadmor and Palmyra are the Syrian and Greek names of the same place; and the Arabs still call it Tadmor. In this circumstance they are remarkably particular; preserving the antient names of places through various revolutions, and in spite of those given by the Greeks and others. But those structures which were erected here by Solomon, there is reason to believe were destroyed by Nebuchadnezzar, king of Babylon, when he took Jerusalem. For it is almost impossible that there could be such elegant buildings here, before the Greeks took possession of Syria; and this, perhaps, is the reason why Xenophon takes no notice of it in his retreat; though he is, in all other respects, very exact in describing the deserts. Neither need we be surprized that it is not mentioned in any of the accounts we have received of Alexander, who passed through this place in his way to the Euphrates. From its situation between Antioch and Seleucia, and its being an important barrier against the Parthians, one would imagine it to have been built by one of the Seleucidæ, though we can find nothing of it in history; and yet no time is so proper to enquire about it, as from the death of Alexander to the reduction of Syria to a Roman province. There is great reason to believe that Palmyra submitted to Alexander the Great, and was for some time governed by his successors; but this evidence would not amount to a positive proof, unless supported by collateral circumstances. Let us go further, and we shall not find this city so much as taken notice of when Pompey reduced Syria to a Roman province. Had these statues been erected there at that time, they could not have escaped the notice of Pompey, who was a man of merit, and would, undoubtedly, have gloried in telling the Roman senate, that he had conquered one of the most magnificent cities in the world. We are told, indeed, that Marc Anthony attempted to plunder it; but the people retired with their most valuable effects over the Euphrates; and this is the first time Palmyra is mentioned in history. At that time most of the inhabitants of Palmyra were merchants, and supplied the Romans with most of the commodities of Arabia and the Indies; and the sole motive that induced Marc Anthony to attack them, was, to enrich his army, in order to keep them attached to his party. From all this it appears, that they were a wealthy free people in the time of Marc Anthony; but how long they had been so, we are, as it were, left to guess. Their riches and trade must have been of some standing; for we find, that within forty years afterwards they fell into all manner of luxuries.

From every circumstance we have here recited, it appears, that this city had existed long before the times of the Romans; but that its grand stupendous buildings are not older than the times of Alexander's successors, and, probably, some of them much later. Of this we shall have occasion to take notice afterwards; but, in the mean time, must lament, that the depredations made by tyrants have thrown a darkness over history, which nothing less than unwearied industry can clear up.

During the disgraceful and indolent reign of the emperor Galienus, the Roman glory in the east was gradually more and more obscured; and when Odenathus joined the Ephesian party, and collected the poor remains of the discomfited Romans in Syria, he routed the Persian troops, and took possession of the capital of that empire.

On his return from this expedition, he was in a manner adored by the Romans as their deliverer, and declared Augustus, co-partner in the empire with Galienus.

This Odenathus was a native of Palmyra, but we have no account of his family. He was brave, courageous, patient under fatigues; and such an admirable politician, that he knew how to balance power between Rome and all her contending adversaries. But all the accounts of this Odenathus serve rather to sharpen than satisfy curiosity.

The fortune of his queen Zenobia, who survived him, was various and surprizing. Her character was great and extraordinary. Her complexion was dark brown, owing more to the hardy manner in which she lived, than to her constitution. Her eyes were black, sparkling with uncommon lustre. Her teeth exceedingly white. Her countenance sprightly. Her voice strong and clear. Her air noble. And her person graceful and genteel. She inured herself much to fatigue, was fond of riding, never used any carriage, and often marched on foot at the head of her soldiers. She was generous, but not profuse; and so chaste, that the only end she had in view when she married, was propagation. We have no genuine account of her religion, for although there can remain no doubt but she was brought up a Pagan, yet some have asserted that she embraced christianity. After the death of her husband, she assumed the reins of government in the name of her children; and having renounced all alliance with the Romans, and declared war against them, she attacked and defeated the Roman general Heraclianus, who had been sent against her, and he himself narrowly escaped falling into her hands. This victory in some measure gratified her ambition, for she took possession of Syria and Mesopotamia.

Aurelian, the Roman emperor, marched against her, and besieged the city of Palmyra, but was gallantly resisted by the garrison. However, Aurelian finding himself reduced to great straits, resolved to make one general attack, which he did, with much violence, and took the city. Longinus, the famous orator, was taken prisoner and beheaded; and Zenobia was carried to Rome, where she had lands assigned her; and afterwards married, and had several children.

Palmyra being thus subdued, became a Roman province; and about the beginning of the fifth century, we find the Illyrian legion quartered here. After this we find little mention made of it, till the latter end of the twentieth century. At that time several European gentlemen, who travelled into Asia, visited those stupendous ruins, and now they are well known.

The country round this celebrated place resembles a desert; but there is great reason to believe that it was not always so. That the country was once fertile, will appear evident to every one, who considers that no prince of common sense would ever have erected such structures, had not all the necessaries of life been in the utmost plenty. A reason, however, may easily be assigned for the present barrenness of the place. The devastations made in the country by the wild Arabs, though they never approached the city; the vast shoals of land, which nothing but industry could reap, contributed to render that once beautiful spot a desert. It is true, it was called a desert, when Solomon first built a city here; but then it should be remembered, that by the word Desert, in the Old Testament, is always meant some part of Arabia, or some province bordering upon it.

And, indeed, notwithstanding it is a desert in which the remains of this once celebrated city stand at present, yet even that desert could be cultivated by industry. Nothing more is required, than to remove the sands which annually overflow the grounds. This was undoubtedly done formerly, and why should not it be so at present? One thing indeed is wanting, and that is, a regular form of government; nay, there is no form of government at all, for sometimes the poor people who reside in the place are subject to the Turks, sometimes to the Saracens or Arabs; and at other times they live in so forlorn a manner, that virtue goes unrewarded, and vice unpunished. In such cases, we cannot expect the best information, but the best we can procure is here presented to the reader.

The pillars of the temple are all in the Corinthian order, and as finely executed as any in the world.

It is indeed amazing to think how the antients made such progress in the knowledge of architecture, which of all sciences is perhaps the most difficult. It requires a perfect knowledge of geometry; and the person who professes it, should be well acquainted with painting.

That the antients were so, cannot be doubted; and yet it is taken for granted, as an absolute truth, that they were far inferior to the moderns. This is the more surprizing, because we cannot find that any of the moderns, notwithstanding their knowledge of geometry, have ever been able to erect such grand, such elegant, such magnificent structures as the antients. Is this owing to a vitiated taste, or rather is it not owing to too much refinement in learning?

There is a possibility of carrying ingenuity too far, and this is always done, when men lose sight of nature.

To build, to plant whatever you intend;
To rear the column, or the arch to bend;
To spread the terrace, or to swell the grot;
In all, let nature never be forgot.

POPE.

But leaving Palmyra, we shall now proceed to describe such other places in the east as have not hitherto come under our observation, and these in the words of the best modern travellers.

Mr. Henry Maundrell, who was many years consul to the English factory at Aleppo, has given us the best account of some parts of Palestine that ever yet were committed to writing. Next to him is Dr. Shaw and Dr. Russell, gentlemen well known in the literary world, and from their accounts we shall give a description of Palestine, Syria, and all the provinces adjoining thereto.

We set out (says Mr. Maundrell) from Aleppo to visit Jerusalem, on the 2d day of February, accompanied by fourteen gentlemen belonging to the English factory, and lay that night at Honey Kane, a village four miles west of that city; we found no market-towns here, as in England, being obliged to lodge often in tents, or in public buildings, called caravancies. Buildings of this sort are to be found in most parts of the Turkish dominions, at convenient distances from each other; and, for a small consideration, travellers are permitted to lodge under a roof, and within fine walls. But if the traveller does not bring along with him his own bedding, and all other necessaries that he may happen to want, he has but a poor chance of being supplied with any. These places are built like cloisters, being generally about forty yards square, and the Turks call them kanes.

Next day we travelled about sixteen miles, passing by a village called Oo-rem, where we saw the ruins of a church which had formerly belonged to the Greek Christians; and in the evening we encamped at the village of Kusteen. Here we saw above twenty small villages, with ground around them well cultivated, and the whole had a most beautiful appearance. The soil to the southward is of a reddish colour, loose, and quite free from stones: whereas to the westward there rises a high ridge of rocky hills, whereon there is not the least appearance of earth or mould. Kusteen is a pleasant village on the west of the plain, surrounded with corn fields; and there is such plenty of pigeons, that one may reckon more dove-cotes than dwelling-houses. Here are many ruins of old buildings, supposed to have been monasteries among the mountains, and from the impression of a cross and a Greek inscription on a marble stone that is over the door of a bagnio, there is reason to believe that it once belonged to a Christian church, about the time the Mahometans were in this part of Asia.

On the 28th of February, we rose early in the morning, having a long journey to make, and in less than an hour came to a small village, which terminates this delightful plain. Here we crossed a small, gentle ascent, and steered our course through another delightful valley, called Rooge, which runs east and west, being bordered on each side by very high mountains.

Travelling about twelve miles further, we came to a lake, over which we had much trouble to ferry our mules and baggage; yet at our return, we found

The

the ground so dry, that we could scarcely believe it to be the same spot. About three miles further, we came to a lake called Te-ne-ree, where we were obliged to pay a toll, which is demanded by the Turks, under pretence of keeping up a standing army to repel the incursions of the wild Arabs, who constantly infest the country. These duties were first set on foot by the Christians while they were in possession of this country, and the Turks have taken care to continue them. Indeed it is a great imposition, for although they pretend that the money is to maintain a standing army to repel the Arabs, yet travellers are always in the same danger from those barbarians as if they had paid no money at all, which we found afterwards in the course of our journey.

Our stage this day was thirty miles, in which we passed over steep mountains west of Rooge, and halted that night at Shoggle, a very disagreeable town, lying on the banks of the Orontes, over which there is a bridge of thirteen arches. The water here is extremely rapid, very unwholesome, and the fish that it nourishes is such bad food, that those of our company who chanced to eat of it, found themselves very much indisposed the ensuing morning. We lodged here in one of the best kanes that could be met with on the road, and we were supplied with meat and broth at a very reasonable expence. The place was filled with Turkish pilgrims who were going to Mecca, and they behaved in the most peaceable manner.

The next day's journey was pleasantly variegated with hills, dales, and open plains, adorned with myrtles, tulips, roses, aromatic herbs, and indeed every thing that was either pleasing to the smell, or refreshing to the sight. Delightful however as this scene was, it did not continue long, for we soon came to some wild, stony places, which were in a manner impassable; for the torrents washed down upon us from the adjacent mountains with so much fury, that we frequently considered ourselves in danger of being swallowed up.

In a valley through which we rode this day, we saw a remarkable crack in the earth, the depth of which was about thirty yards, and the breadth four, with a small stone arch, over which we passed. A stream of water pours into this breach of the earth, and the noise made by it is extremely horrible. This narrow channel is called the Sheak's Wife, in memory of a woman of quality, who fell into it and perished.

March the 2d, after travelling six miles, we arrived at the foot of a mountain, called Occaby, which we climbed up with great difficulty, the way being steep and slippery, because of the rainy season. Having reached the top of this hill, we found ourselves in a well cultivated country, abounding with mulberries, and multitudes of silk worms. Here we came to a village where the kane or caravancy was very bad, being exposed to the inclemency of the weather. This induced us to visit the aga, who had a house adjoining; and though we carried a very valuable present to him, yet it was with much difficulty we obtained permission to sleep in a dry corner during that night, after we had suffered so much fatigue.

This village is called Bellulia, and has a few Christian inhabitants, whose church is so poor and mean, that it puts us in mind of the humiliation of our Redeemer when he was laid in a manger. It is only a dirty room, about four or five yards square, the ground floor uneven, without any pavement, and the ceiling a few straws or branches of trees covered with mud and turf. The altar is built of earth, and on it are some few slates and potsherds, which gives it the air of a table. There is a small cross, composed of two laths nailed together in the middle, and on each side two or three old prints, representing the blessed virgin and her son. These we were told had been the gifts of some travelling friars who had visited the Holy Land. - Near a plank, which was supported by a post and served for a desk, was a hole broke through the wall to give light to the reader. Yet mean as this building was, the people approached it

with reverence, making it the repository of their most valuable effects, and laying their silk-worms round it, in order to obtain a benediction.

March the 4th, we travelled twelve miles through very bad roads, it raining all the while very heavily, after which we arrived at a poor village called Shalfatia. Here runs a small river, which was considerably increased by the rainy weather. The houses in this place were so extremely dirty, the people and their cattle living promiscuously together, that the stench was intolerable. There being no intermission of the rain, it was impossible to encamp in the open country, and there was no such thing as going back. The river was not fordable; the rain rather increased than diminished, while the lightning flashed from every quarter, and it thundered incessantly. We therefore betook ourselves to a rising ground, where we proposed to pitch our tents, but were prevented by the inclemency of the weather; nor was our uneasiness for our horses and servants less than for ourselves. At last we perceived a small Sheak's house, or burying ground, at a short distance, and entertained some hopes of finding shelter there; but in this we were disappointed, for the Turks absolutely refused to suffer us to come near the spot, swearing at the same time that they would sooner lose their lives than suffer unbelievers to come near the tombs of their ancestors. However, with good words and a present, we prevailed upon them to let us secure our baggage here, and at night taking advantage of the darkness we stole in, and spent some hours among the tombs. Indeed we were glad to get any shelter, for it rained during the whole of the night. Next morning we were informed that at a place a little further below the river was fordable, and thither we removed with our baggage, glad of an opportunity of getting out of this inhospitable place. Having crossed the river, we ascended a very steep hill, from the top of which we had a view of the ocean, and of the city Latcike, which is very antient, and was formerly a place of great magnificence, but shared in the general calamities of this part of the world.

This city is situated near the sea, in a plentiful flat country, and has every advantage for commerce. Descending from this hill, we kept the sea on our right hand, and a ridge of mountains on our left; and not far from the road we discovered two stone cavities, each thirty feet long, and the outsides were adorned with carved work of heads of oxen and inscriptions, but the words were not legible.

They appeared to have been funeral monuments, but the stones with which they had been covered were probably removed by some persons who searched for treasure. There appeared to be several foundations of buildings in the neighbourhood; but whether this had ever been a place of any note, we could not determine. About three miles from these tombs, we came to another river, which being swelled, again stopped our progress. It is very dangerous crossing these streams, which take their rise in the mountains, unless a man be well acquainted with the country, and knows in which particular places they are most shallow. However, at length we found a ford, and made the best of our way to Jubilee, leaving our baggage behind, because it rained and hailed most terribly; and here we rested ourselves most of the next day, in a new kane that had been built by Ostan, basha of Tripoli.

This town called Jubilee is a poor place, lying close by the sea-side, situated in a fine country, and was formerly of great repute, for in the time of the Greek Emperors it was a bishop's see. Here it was that Severion, the Greek Arian Bishop resided, who was such an inveterate enemy to Chrylostom; and at last by his intrigues had that great man banished from Constantinople. One Ibrahim, a Turkish prince, lies buried here in a mosque built by himself, and close to it are several alms houses for the poor. Tho' the Turks hold the memory of this prince in great veneration, yet they permitted us to visit both the

mosque and the tomb. Over the grave there is a great wooden chest, covered with painted callico, reaching every way to the ground, and round it are hung large beads on ropes, which give it the appearance of a button-maker's shop. It is a common practice among the Turks, to hang such things round the tombs of the deceased; and such was the practice of the antient Greek pagans. In the mosque are several pieces of curious church furniture, brought hither from Cyprus, when that place was taken by the Turks. These are kept as trophies of their victory over the Greeks in the Levant, for the Mahometans make no manner of use of them in their religious worship.

It is very remarkable of this Sultan Ibrahim, that there is no mention of him in history, and yet the Turks are fully persuaded of his existence, although they cannot tell the time, nor indeed any thing at all worth mentioning. They shewed us a grotto near the sea, cut out of the solid rock, in the midst of several sepulchres, and here they told us he frequently resided; but this is no more than oral tradition, handed down from one generation to another. They likewise shewed us an oratory, where, they say, he performed his devotions; the front of this oratory looks towards Mecca, for all the Mahometans are obliged to look that way when they pray. This was intended to divert them from image worship, and to impress upon their minds a lively idea of the invisibility and spirituality of the Divine presence.

About two furlongs from this place, the Greek Christians celebrate divine service, in a grotto, open towards the sea, and the altar is only a pile of stones. All along from hence to Jubilee, are fragments of pillars, and other ruins, which serve to shew that it was once a great place, and no doubt celebrated for its splendor while the Greek Emperors resided at Constantinople.

At the south gate are the ruins of a theatre, on one side of which the seats of the spectators still remain entire, but the Turks have blown up part of it, and built houses on the rest. The outward wall, built of large stone, is near four feet thick, to which strength we may attribute its having been so long preserved from the destruction carried through this part of the world by Turkish barbarity. In the mountains above Jubilee, there are a sort of people called Neures, who have no particular religion, but always profess the same principles with the people who travel among them; with Jews, they are Jews; with Christians, they are Christians; and with the Turks, they are Turks. They are extremely ignorant, but at the same time they are cunning enough to steal privately from strangers, when they can find an opportunity.

On the 6th of March we left Jubilee, in hopes of better weather, of which there was some prospect, and in about four hours we arrived at the Balanea of Strabo, called by the Turks Baneas; and here we were obliged to pay tribute. This town lies upon a clear, swift stream, about a furlong from the sea, and has at present a few inhabitants. Near it are many square towers, and ruined buildings, which serve to shew that it was once a very considerable place. Travelling about three miles further, we saw a castle on the top of a hill, which the Turks told us, was once a place of great strength, having sustained several sieges during the crusades. This is probably the place to which the bishops of Balanea removed, to avoid the insults of the Saracens, during those long, destructive, unnecessary, and ruinous wars.

Next day we arrived at Tortosa, the antient Orthocra, formerly a bishop's see, and frequently mentioned in the histories of the crusades. On one side it is washed by the sea, and on the other it is fortified by a double wall of coarse marble, built in the rustic fashion. Between the walls is a ditch, and on the outside is another, dividing the outer wall from the country. The entry to the fortress is on the north side over a draw-bridge, which leads to a spacious apartment, but the roof has been partly blown down,

although it was arched over with stone formerly, and was for many centuries a Christian church. It has still the appearance of a church, and on several parts of the walls are fine carved images, alluding to the Gospel History.

Part of this church has been converted into a castle some years ago, for there are still some port holes for guns to be seen on the north wall. On the south and east sides the city formerly stood, and was a place of great strength, but now there is little left besides a church, which stands about a furlong east of the castle. The walls and pillars are of a sort of rough marble, and still so well preserved, that a small expence would restore the whole again to a beautiful state; but it is melancholy for Christian travellers to see such a fine edifice turned into a stable.

Travelling about three miles further, we came to Arandus, where we pitched our tents upon an eminence not far from the sea. Here we observed an earthen wall, stretching east and west farther than a furlong, with parallel stairs cut all along its sides. It is situated above two furlongs from the sea, in a flat marley ground. It is difficult to say for what purpose it was intended, and still more difficult to believe that ever the water flowed so high. Here is a court upwards of fifty yards square, hewn out of a solid rock; and in the middle of it is a throne composed of four square stones, one on each side, one behind, and the fourth laid over the others, to serve for a canopy.

It is possible this might have been formerly a temple dedicated to Hercules, it being the constant practice to worship that deity in the open air; and if so, then the throne, which is three yards high, must have been the place for the idol, who sat there to receive divine adoration.

About half a mile to the south we made our way into two towers, through weeds, rubbish, and briars; and we found these buildings divided into vaults, for the interment of the dead. Some of them were upwards of eight feet long; though we could not infer from that circumstance that the bodies they were designed for were of such gigantic size. At the same time we could not help being surprised that men should dig into these solid rocks any further than was necessary for the purpose they had in view.

From the vast number of ruins we saw here, we concluded that this must have been once a very famous place, perhaps the Ximyra of Strabo, or the same with the country of the Zemarites mentioned in Genesis x; but this, however, is rather conjecture, though not at all improbable.

Leaving this part of the country, and these remains of antiquities, we travelled over a spacious plain of about twenty miles in length, and finely watered with the most delightful streams. Each of these streams had stone bridges over them, which is not very common in many parts of Tartary.

As we drew near to Tripoli, our mule drivers were afraid to advance, lest their beasts should be pressed for the public service; which was afterwards the case, notwithstanding our using every caution to prevent it. We staid in Tripoli a week, and met with very generous treatment from Mr. Hastings, the English consul, and a merchant of the name of Fisher. One day we dined along with Mr. Fisher by the side of a river, in a neat delightful valley, about a mile east of the city. Across this valley, from one hill to another, is a magnificent aqueduct, which conveys as much water as serves all the inhabitants of Tripoli. It is not a Turkish work; and as it is called the Prince's Bridge, it is the opinion of most travellers, that it was first erected by Godfrey of Boulogne, while he was king of Jerusalem, during the crusades.

Tripoli stands a little above a mile from the sea, having two hills, one to the east, upon which is a castle, commanding the town; and another on the west, standing between it and the sea. The latter is said to have been at first raised from the sand of the shore blown together in a heap, and daily increasing in

in such a manner, that if some of their old prophecies are to be believed, it will one day prove the grave of the whole city; but of this the inhabitants seem not to be much afraid.

On the eleventh of March we dined with Mr. Hastings the consul, who in the evening introduced us to the basha, having first secured a welcome reception by a present which we sent him. No person of rank who is a native, can be visited here without a present; which custom is not only universal in the east, but likewise of great antiquity. Nay, such deep root has this practice taken in the minds of the people, that even the poor who have nothing valuable to give, will present a horse, or any thing growing in their gardens; for they must by no means come empty-handed, otherwise they would be considered as dishonouring the person whom they address.

In the afternoon of the 12th we visited a great convent called Belnocant, founded on a very high rock, scarcely accessible. From the top there is a fine prospect of the sea, and all the country round. The chapel is large, but dark, and no person must approach the altar but the priests; a custom that takes place in all the Greek churches. As the Turks will not permit the use of bells, these monks summon their people together to divine service by beating one wooden mallet against another, at the door of the church.

Their service consists of a few prayers and hymns, to Christ and the Virgin Mary; but they repeat them in a very irreverent, indecent manner. The priest walks round the altar three times, and perfumes it with incense, repeating at the same time several prayers. Five small cakes, each having a lighted taper stuck in the middle, are brought into the body of the church, and placed upon a small table, covered with a clean linen cloth; and then the priest preaches that part of the gospel where it is recorded our Saviour fed the multitude with five loaves. After this, the deacon comes and breaks these cakes into small bits, and presents them in a basket to the congregation.

Each of the people present eat a bit, after which the priest pronounces the benediction, and then dismisses the people. This is their evening service, and the same which the Roman Catholics call Vespers. Around the inside of the church are stalls, such as are used in the chapels of the colleges in our universities; and from each stall hangs a crutch, on which they lean while they sing their litanies; it being contrary to their rules to sit during any part of the service, although it is extremely long. The young monks use these as well as the old ones, although it should only be for ostentation. There were forty monks in this convent, whom we found to be good-natured industrious men; but so very ignorant, that they could not account for the meaning of the ceremonies used in their religious worship. The chief of the convent was so very simple, as to tell the Consul, that we did them as much honour by our visit, as if the Messiah had honoured them with a visit from Heaven. But neither their ignorance nor simplicity will be much wondered at, when he who officiates at the altar, is obliged to cultivate the ground, to prune the vines, and take care of the sheep, and other cattle.

These labours the poor creatures are obliged to undergo, in order to procure themselves a subsistence, and likewise to satisfy the exorbitant demands of the Turks, who are continually squeezing out of them all the fruits of their labour. It is certain, that there are not more miserable creatures in the world, than these Greek monks, and yet they are so courteous to strangers, that even compassion will shed a tear where there is not a power to relieve.

On the 13th of March, we visited the basha a second time, and were received in a very courteous manner; for the Turks are neither strangers to the arts of civility, nor of endearments, which leads us to mention something concerning their ceremonies on these occasions.

The first thing to be done, is to send a present, that being absolutely necessary, and then a time is fixed for the person to attend. He is met by a servant at the outer gate, who conducts him to another servant, and thus he passes from one to another, till he comes to the master, who receives him leaning on a couch, for they use no chairs. This couch is called the Divan, and is about eighteen inches high from the floor, spread over with carpets, and pillows to lean on.

They are such a lazy, indolent people, that they spend great part of their time in reposing themselves on these couches, which they have decorated in the most costly manner. As soon as the person approaches the side of the Divan, he puts off his shoes, and stepping up, leans down beside the master of the house, if he is a man of high rank, such as the basha was whom we visited. In this manner were we conducted into the basha's apartment, who discoursed with us very familiarly, and with great good-nature. He entertained us with sweetmeats, coffee, and sherbet. It was natural for us to consider many of these ceremonies as ridiculous; but when custom has established any thing, it becomes, as it were, a second nature; and passes among the inhabitants as a thing so sacred, as not to be dispensed with.

Having finished this visit, we rode out to take a view of the port, which is half a mile distant from the city, laying open to the sea, and defended from the force of the waves by two small islands, one of which abounds with birds, and the other with rabbits; and therefore the one is called Bird Island, and the other Rabbet Island. At convenient distances from each other along the shore, are six square towers, to secure the place from pirates, but they have neither arms nor ammunition in them. In the fields, near the sea, are some grand ruins; for here were formerly three cities standing near each other, from whence the name Tripoli is derived. On the 15th our company were impatient to continue their journey, but we were prevented, because the muleteers were not to be found; they having fled in fear from the servants of the Basha of Sidon, who were abroad pressing mules for their master. However, about three o'clock, we furnished ourselves with fresh beasts, and travelled forwards, keeping close to the sea, which brought us to a high promontory, which was both steep and rugged. On the other side of it we had an open view of the sea; and passed into a narrow valley, the entrance of which is defended by a castle, called Temfeida.

About half an hour after we passed by Patrona; but there are very few remaining marks of its ever having been a place of any considerable note. Three hours more brought us to Gibyle, called by the Greeks Bibulus, famous for the Temple of Apollo, who is supposed to have been born here. It is encompassed with a wall, a dry ditch, and has several square towers, forty yards distant from each other, and was formerly a place of great extent, and very handsome; though at present there is nothing in it remarkable, except some pieces of antient pillars. Thence we passed over a fine stone bridge, and lay that night in our tents by the water-side, during a most dreadful storm of wind and rain. In the morning we found the river of a bloody colour, proceeding, doubtless, from some mineral that had been washed into it by the tempest. Here we found to be true what is asserted by Lucian, that at certain seasons of the year this river is the colour of blood. The poets tell us, that it weeps blood for the death of Adonis, who was the favourite of Venus, and was here torn to pieces by a wild boar; so that the river was, from him, called Adonis; but the Turks call it Ibrahim.

Having crossed this river, we came into a road, lying between the steep mountains of Cartravan, famous for its excellent wines; and near it is a part of the sea, called the Bay of Juria. At the further side of this bay there is an old tower, square built, and there are several of them along the coast, all of which are

are said to have been erected by the empress Helena, as a defence against the pirates, who, in her time, were frequent in these parts. All this neighbourhood is inhabited by Maronites, who are, in a manner, infinitely more insolent than the Turks. They demanded a tribute of us, which we were obliged to pay; and their pretence was, that it was for the support of their bishop, who claims a jurisdiction over this part of the country as far as Aleppo. Here we refreshed ourselves in the open air; and, in about an hour after we arrived at the river Lions, called by the Turks Mahor-Kelys. There we saw an image in the form of a dog, which, in antient times, was worshipped by the inhabitants. At present its body is pointed out to strangers, laying with its heels uppermost, in the water; but the people told us, the head was preserved as a great curiosity at Venice. Some of our antient geographers have confounded this river with Adonis, already mentioned; but real experience convinced us to the contrary.

Over this river is a good bridge of four arches, and close to the foot of it is an inscription in Arabic characters; setting forth, that it was the work of Emir Facardine, a person of great eminence, and who erected several structures, of a public nature, for the benefit of his countrymen. Having crossed this bridge, we ascended a rocky mountain, by means of a passage cut through it at the expence of the Emperor Antoninus, otherwise there could have been no possibility of passing between it and the sea. The memory of the Emperor Antoninus is preserved in an inscription cut on the rock; and here are some remains of a rock that had been cut before, with several characters and figures, but they are so defaced, that we could not make any thing of them. We were sorry to be hurried away before we had an opportunity of making some further enquiries into the nature of these antiquities, which, if properly attended to, would have thrown some light upon many passages, both in sacred and profane history.

Near this place we saw a chapel, dedicated to St. George, who, according to the legend, slew the dragon; but it is now turned into a mosque. We thought to have learned something from the traditional accounts of the Greeks, concerning this person called St. George; but, so far as we could learn, they knew nothing of him.

The day following we spent at Beroote, being informed that the river Damers, which lay before us in our next stage, was so increased by the late rains, that it would be impassable. This place was in old times called Bereytus, from which the idol Baal-Berith is supposed to have its name. The Emperor Augustus conferred many privileges upon it, and gave it the name of Julia Felix. At present it retains nothing of its antient grandeur, except the situation, which is the most delightful that can be imagined. It is situated near the sea, in a soil fertile and delightful, raised only so high above the water as to be secure from its overflowings, and from all the dangerous effects of that element. The adjacent hills supply it with fresh water, which is dispersed all over the city in very convenient fountains, cut out with great art, which shews it to be of great antiquity; but otherwise it has nothing extraordinary to boast of.

We have already mentioned the Emir Facardine, and here we shall add something concerning him by way of digression. In the reign of the Sultan Morat he was the fourth Emir, or Prince of the Drunces, a people supposed to have been descended from some remains of those Christians who were destroyed by the Saracens, after the crusades. These people for some time betook themselves for shelter to the mountains; but Facardine, their prince, not chusing to be cooped up in a corner, enlarged his dominions down into the plain, all along the sea-coast, as far as Acra. The Grand Seignor at last growing jealous of such a swelling power, attacked him, and drove him back to the mountains, from whence he had broke loose; and there his posterity maintain

their sovereignty to this day. We went to view the palace of this prince, which stands on the north-east part of the city; and at the entrance to it is a marble fountain, more beautiful than what is commonly to be met with in most parts of Turkey. The palace within consists of several courts, most of which are falling to ruins, and some of them appear never to have been finished. The stable yards are curious; and there are several apartments for wild beasts.

The most pleasing sight this place afforded; was a fine orange garden, of a square form, and divided into four lesser squares, with walks between them; delightfully shaded with orange trees, of a large spreading size, and all of so fine a growth, that nothing could give more pleasure to the senses. We saw great quantities of fruit hanging over us; and the delightful streams of fresh water that runs through the little canals, added such a fragrance, as exceeds the power of description. But delightful as this place was, such was the stupidity of the inhabitants, that they made it a fold for sheep and other cattle. Indeed; the Turks are the most indolent people in the world; for they have no taste for any thing of politeness. Their notions of moral and civil justice are not to be despised; but they seem to take little pleasure in beholding the works of creation, and much less in cultivating the arts and sciences. All their pleasure seems to be of a sensual nature; so that, in many parts, they are but little distinguished from the brutes that perish; and this is, probably, owing to the carnal notions taught them in the Alcoran.

On the east side of this garden were two terrace walks, rising one above another, each of them having an ascent to it of twelve stones. They had several fine dispersed shades of orange trees; and at the north end were lofty summer-houses, and other apartments, being designed by Facardine as the chief seat of his pleasures.

It may, perhaps, be wondered how this emir should be able to contrive any thing so elegant and regular, seeing the Turkish gardens are usually nothing more than a confused parcel of trees, jumbled together without art or design; so that they seem like a natural thicket, rather than cultivated gardens. But Facardine had been in Italy, where he had seen things of another nature, and knew well how to imitate them in another country. Indeed, it appears by these remains, that he must have been a man of taste and abilities, far above the common cast of the Turks. In another garden are to be seen several pedestals for statues, from whence it may be inferred, that this emir was not a Mahometan; because the religion of that people absolutely prohibits the setting up of images of any creature whatsoever; and this sentiment was introduced into the Alcoran in consequence of the idolatry of the Heathens, and the image-worshippers of the antient Jews.

At one corner of the same garden stands a tower sixty feet high, designed, as appears, to have been carried to a much higher elevation, to serve as a watch-tower, and for that end built with extraordinary strength; its walls being twelve feet high. From this tower there is a fine view of the whole city, and a large Christian church, said to have been consecrated by St. John the Evangelist; but the Turks have converted it into a mosque, so that we were not permitted to enter it. There is another church in the town, which seems to be antient, but, being a mean fabrick, is suffered to remain in the hands of the poor oppressed Greeks. It is adorned with abundance of old pictures; and amongst the rest is that of Nestorius, the Heretic, who, indeed, generally makes one among all those we find in the Greek churches; though they neither profess his heresy, nor do they seem to know any thing at all what he was; for they are so ignorant, that all their knowledge is confined to tradition. But the most remarkable thing in this church, is an old figure of a saint, drawn at full length, with a long beard reaching down to his feet. The priest told us it was Nicephorus, and observed, that he was

a person of the most eminent virtue and piety in his time; but his great misfortune was, that the endowments of his body were not equal to those of his mind; this threw him into a deep melancholy, of which the devil taking advantage, promised to grant him any thing he wanted, if he would fall down and worship him. The saint, though very willing to obtain what was promised, but unwilling to obtain it at that rate, rejected it with indignation, declaring that he would bear any indignity rather than comply with terms proposed by the devil. At the same time he took his beard in his hand, to witness the stability of his resolutions, and behold, as a reward of his piety, he found the hair stretch; so that without giving him the least pain, they tell us it stretched down to his feet.

Here is an old ruined castle, and the remains of some other buildings, which seem to have been built by the Romans; but we have no regular accounts of them that can be depended on.

March 19th we left this place, and in our way to the banks of the Damer passed over a plain, on which was a grove of pines, yielding a most delightful shade. We supposed it to have been one of Facardine's plantations, and to the left we saw a small village called Suckfoal. It belongs to the Drunces, who still inhabit those mountains, and the present prince is the grandson of Facardine, and, like his ancestors, never sleeps in the night, being always afraid of assassination.

The river Damer frequently swells with sudden rains, and many unwary travellers are frequently drowned. At this time it was very mild, and far from being dangerous, and here we found some Turks stripped naked ready to help us over, but we did not chuse to accept of their assistance; having been previously advised of an easier ford a little higher up, where we passed without any difficulty. These guides are sure to impose upon travellers, and if they are not satisfied with what is given them, they do not scruple to drown them, which they give out was accidental.

Travelling two hours further along a very disagreeable road, we came to another river called Awle, which issues from the springs in Mount Libanus. The channel is deep, and over it is good stone bridge; and here we met with several French merchants who belonged to the factory at Sidon. These gentlemen conducted us to that city, and we pitched our tents without the walls, by the side of a small stream of pure water. The French consul, and all the merchants belonging to the factory, inhabit a large house near the sea side, at the foot of which there is an old mote, which Facardine caused to be pulled up, to prevent the unwelcome approach of the Turkish galleys; so that at present ships are obliged to ride for safety under a ridge of small rocks, about a mile distant from the city to the northward.

Sidon was formerly much larger, and more inhabited than at present; but however, it is still well inhabited, and probably many remains of antiquities lie buried under the Turkish buildings.

The French consul here is obliged to visit Jerusalem every year, to see that the poor citizens have justice done them by the Turks.

We had written to this gentleman from Aleppo, with a view to secure him as a partner in our journey, but he had set out a day before we arrived.

March the 20th, we left Sidon, and marched fast, in hopes to be able to overtake him, and passed by a ruined village, supposed to be the antient Sarepta, famous for having been the residence of the prophet Elijah. It consists of a few houses lying scattered on the top of a mountain, about half a mile from the sea. Three hours more brought us to the banks of Casimeer, a broad deep river, over which was formerly a stone bridge, the piers of which are still standing, but the arches are broken down, their places being supplied with beams and planks, very carelessly laid over. Here, notwithstanding we passed with great precaution, one of our horses dropped into a hole, but was so strong, that he swam to shore without any assistance.

From this river we travelled over ruinous grounds,

till we came within sight of Tyre, so much celebrated both in sacred and profane history. But alas! how fallen from that magnificence for which it was once renowned! How different from that Tyre mentioned by the prophets!

And here we saw a divine prophecy fulfilled, which said, that Tyre should be as the top of a rock, yea as a place for fishermen to dry their nets on; for the inhabitants are few, nor have they any other way of procuring a subsistence, but that of fishing. There is not an intire house in the place, but the whole exhibits such a pile of ruins, as may serve to humble the pride of men. In one place we saw the remains of a church, probably built here soon after the time of Constantine the Great. And here we may observe, that of all the ruins of christian churches which we saw between Aleppo and Jerusalem, we generally found the east end intire. We often wondered why this should have happened, but we could not neither receive the least information, nor form a rational conjecture about it. Perhaps the Infidels paid more regard to that part of the structure than to any other, or that the building in that part was more strong than the rest; but, what is still more probable, perhaps the Christians redeemed their chancel with money. From the top of a staircase in this Tyrian church, we had an unbounded prospect of the sea, which filled us with admiration.

The island upon which Tyre stands is now covered with sand, and was formerly surrounded by a wall, standing upon the utmost boundaries of the sea; in its natural state, it seems to have been of a circular figure, with an area of about forty acres, and the foundation of the wall is still plain to be seen.

From Tyre we went to Roselayn, celebrated for its cisterns, supposed to have been built by king Solomon, as a recompence for the materials furnished by Hiram towards building the temple. But upon examining more minutely into the workmanship, we were convinced that they were not of so great antiquity. However, this being ascribed to Solomon, is a strong proof of that prince's munificence, his public spirit, his love of whatever was of utility; and although few of his works are now left, yet they must have been numerous.

One of these cisterns is near a quarter of a mile from the sea; of an octagonal figure, twenty-two yards in diameter, nine yards above the ground on the south side, and six on the north.

The walls are only gravel and small pebbles, but so strongly cemented, that one might be apt to mistake them for the solid rock. On the brink there is a wall stretching round this cistern eight feet broad. This structure, though of such a breadth at the top, is nevertheless hollow; and the water, which is exceeding good, flows in underneath. There is a vast quantity of water here, the cistern being well supplied from the fountain head; and though the stream that issues from it seems four miles within a furlong and a half, yet it is always full. It is impossible to say with certainty by whom these works were constructed, but they are exceeding good workmanship.

From this place we travelled over a white promontory, through which there is a road two yards broad, supposed to be the work of Alexander the Great. It is cut quite through the mountains which overlook the sea; and the steepness and depth, added to the raging of the waves below, render the prospect dreadful, and fill the mind of the traveller with horror.

From hence to the plains of Arca, the road is dismal and rocky, but these plains are well watered and fertile, though for want of cultivation, they are overgrown with weeds, which in many places reached up to the bellies of our mules and horses.

Travelling four hours more, we came to the city of Acra, lying in the neighbourhood of Mount Carmel, being washed on the west by the Mediterranean sea, and bounded on the east and north by the plain. This is one of those places out of which the children of Israel could never drive the antient inhabitants. Its original name was Accho, but when Ptolemy enlarged it, he gave it the name of Ptolemais.

In the wars between the Christians and the Saracens this city sustained many a long siege, but was totally subdued by the latter, who revenged themselves upon it for all the trouble it cost them, by laying it in ruins; and from this destruction it has never been able to recover. From the remains of its walls, ramparts, and ditches, it appears to have been a place of great strength. Here, among other ruins, are the remains of a large church, which formerly belonged to a nunnery.

On May 19th, 1291, when the Saracens took this city by storm, the abbess of the nunnery summoned her sisters together, and represented to them what they were likely to suffer from the invaders, who undoubtedly would ravish them. She added, that the only way to preserve their chastity, was to summon up all their courage, and imitate her example. This they promised faithfully to do; when taking up a knife, she mangled her features in such an extraordinary manner, that it was horrible to behold. None of her flock were backward in using the same methods, for the preservation of their chastity; and thus they transformed themselves from perfect beauties into spectacles of horror and detestation. The enemy soon after broke into the convent; and, being disappointed of the hopes they had entertained of gratifying their lust, put every one of them to the sword. At Acra we had the pleasure to find, that the French consul had halted for us two days; and with him we set forwards the next day, conducted by a band of Turkish soldiers. We took the middle way over the plain Esdraelon, in order to avoid, as much as possible, falling in with the Arabs, who were at great variance with the Turks. The Turks do all they can to foment divisions among those wild people, by setting up several chiefs over their tribes, deposing the old ones, and placing new ones in their room; by which they create contrary interests and parties amongst them; preventing them from ever uniting under one prince; which should they ever have ability to do, they would become formidable to the Turks, who could never yet subdue them. But however useful this Turkish policy may be to themselves, yet a traveller is sure to suffer by it, being made the prey of each party of Arabs, according as he happens to come in their way.

Having travelled along the coast of the Bay of Acra, we came to a river, which we supposed to be Belus, from the sands of which it is said glass was first made. That night we took up our lodging in a kane, called Legune, where we were well accommodated, and had a fine prospect of the fertile, but uncultivated plain of Esdraelon, which serves the Arabs for pasturage.

Here we found our tents extremely moist from the dew, which had fallen heavily in the night; which pointed out to us in the clearest manner what the Psalmist meant by the dew of Hermon; for mount Hermon and mount Tabor were but at a little distance from the spot on which we encamped, and Nazareth was just in sight.

Our situation was far from being agreeable; for on each side of us were pitched the tents of two tribes of Arabs, enemies to each other. To the emir, or chief, of one of them we paid a tribute in the morning, and he received us very civilly at the door of his tent; but he conceived a fancy for some of our cloaths, which we were obliged to part with without murmuring. The next day we arrived at Samaria, the capital city of the ten tribes, after they had revolted under king Rehoboam. Herod the Great changed its name from Samaria to Sebastia, in honour of the emperor Augustus. It stands on an oval mount, overlooking a fruitful valley, and a circle of hills at a distance, but little of its ancient grandeur remains. On the north side there is a large square piazza, surrounded by pillars, supposed to have been part of a church built by Helena, in honour of John the Baptist, who was here imprisoned and beheaded, to gratify the revenge of an adulteress.

The Turks have built a little mosque over the dungeon, in which the blood of that saint was shed; and they shew it to Christians for a trifling piece of money.

About four miles west of Samaria is Naplosa, called in scripture Sychar and Sychem; it stands in a low valley; having mount Abel on the north, and mount Gerizim on the south. It was from mount Gerizim God commanded the blessings to be pronounced on the people of Israel; and the curses were uttered from mount Abel.

On the former of them the Samaritans had a temple when our Saviour was on earth; but it was demolished by the Romans. At present there is a small chapel; but we did not see their worship. The Jews, who hate them more than they do Christians, tell us, that they worship a calf, in the same manner as the ten tribes did of old; but this seems to be false. While we were here, we visited the chief priest of the Samaritans at Napolosa, and had a long conversation with him. One question we asked him, among many others, was, relating to the mandrakes which Leah gave to Rachel for the purchase of her husband's embraces.

The priest told us, it was an unwholesome, disagreeable fruit, as large as an apple, having a broad leaf, and ripe in harvest time. This we found to be true, for we met with several of these plants in our way to Jerusalem. This priest was a man of some taste, and had several good books in his library; among which, to our great surprise, we found the first volume of the English Polyglot bible, and a copy of the Samaritan Pentateuch, which we would have purchased, but he would by no means part with it. This town is well peopled, but meanly built, consisting of two streets, running parallel to each other, under mount Gerizim; and it is the seat of a Turkish basha, where we were obliged to pay tribute.

We then set forwards for Jacob's well, mentioned in the fourth chapter of John; where the empress Helena erected a church, of which nothing remains except some parts of the foundation. There is an old stone vault over the well, on the mouth of which is a broad flat stone, and while we were there it was full of water; which contradicts the superstitious story, that it is dry all the year round, except on that day when our Saviour conversed with the woman of Samaria.

Here ends the narrow valley of Sichem, and presents a spacious, open field, watered with a most delightful stream. This night we lay at Kane Laban, and the next day pursued our journey; but not without some fatigue, over a rocky mountain, from which we descended into a narrow valley, lying between two stony hills. Here is said to be the place where Jacob saw the angels ascending and descending in vision; and this is very practicable. We passed on through some plantations of olives, and in less than three hours arrived at the small village called Beer. Helena the empress erected a church here, on the spot where it is said the Virgin Mary sat down to lament for her son, when she was returning to seek him in Jerusalem, and where she found him, sitting among the doctors. All the way from Kane Laban to Beer, there is nothing to be seen but rocks and precipices; so that pilgrims are greatly deceived in finding the country so different from what they had expected, and nothing but barren hills in a country where Joab once marched one hundred and thirty thousand fighting men, besides women and children. Yet these rocks and hills are certainly covered with earth, and by industry made to produce a sufficient subsistence for the inhabitants, no less than if it been a place in a flat country. Nay, there is reason to believe that it produced much more than was necessary; so that they had enough to sell to their neighbours.

In the cultivation of these mountains, their manner was, to pull up the stones, and place them in lines along the sides of the hills, in the form of walls. By these means they supported the mould from tumbling down, or being washed away by the rain. These formed several beds of excellent soil, rising gradually one above another, from the bottom to the top.

The plain country was well adapted for corn and pasture land; and the hills, though improper for the sustenance of cattle, being disposed into such beds as

we have already described, served well for melons, gourds, cucumbers, and all sorts of garden stuff, in which consists the principal food of the inhabitants for several months in the year. The most rocky parts of the country, cultivated in this manner, served for plantations of vines and olive trees; and the great plain adjoining to the Dead Sea, where Sodom stood, was of great service in nourishing bees, for even at present it smells of honey.

The principal food of the people in the east being corn, wine, milk, oil, and honey; this country, as abounding with all these things, might certainly be able to maintain a vast number of inhabitants, and the rather so, when it is considered that the constitutions of their bodies, and the nature of the climate, inclines them to be more abstemious than in colder countries. From Beer we travelled through a wild, stony country, where we saw many ruined villages, and within two hours came within sight of Jerusalem, from the top of a hill, having the mountains of Gilcad on the left hand, and the plains of Jericho, with Ramoth the Gibeah of Saul, on the right. In an hour more, we came up to the wall of the Holy City, and entered by the Bethlehem gate, after having been detained above an hour before we could obtain permission; for without leave from the governor, no Frank, as they call European Christians, can be admitted, except such as come along with a public ambassador. However, as we were in the retinue of the French consul, we were treated with great respect, and suffered to ride in at the gate, which favour could not otherwise have been granted us. At the consul's house we lodged every night we tarried in Jerusalem, and boarded with the guardian and friars of the Latin convent, who, to do them justice, treated us with great hospitality, good nature, simplicity, and indeed every token of respect that could adorn their characters.

We arrived at Jerusalem the Thursday in Passion week; and on Good Friday we accompanied the consul to the church of the holy sepulchre, the doors of which we found guarded by a large body of Janizaries, or Turkish soldiers, who obliged every layman who was a Christian to pay fourteen dollars, and every ecclesiastic seven. The money being paid down, we were permitted to go out and into the church at common hours, during the whole festival; but those who want to go at extraordinary hours, must pay it again. The doors are locked up on the evening of Good Friday, and not opened till Easter-day, the pilgrims being all first admitted. Here we spent all that time, and had an opportunity of viewing every thing in that sacred place, and making ourselves acquainted with their ceremonies. The church is built on Mount Calvary, which is an eminence upon the greater Mount Moriah, which formerly stood without the city, and was reckoned infamous as being appropriated to the execution of malefactors. But since the Saviour of mankind suffered here for the sins of his people, it has been much revered, and so much resorted to, that it is encompassed within the walls of the city, while, to make room for it, Mount Zion has been shut out of the walls.

In order to the fitting of this hill for the foundation of the church, those who designed it were obliged to reduce it to a plain area, which they did by cutting down several parts of the rock, and elevating others; but in this part of the work, care was taken, that none of those parts of the hill which were reckoned to be more immediately concerned in, or connected with our lord's passion, should be diminished. Thus that part of Mount Calvary, where it is said Christ was fastened to the cross, is left entire, being about twelve yards square, and standing at this day, so high above the common floor of the church, that there are twenty-one steps to get up to it.

The holy sepulchre itself, which was at first a cave hewn out of the rock under ground, is now as it were a grotto above ground.

The church is one hundred paces in length, and

sixty broad, yet it is so contrived, that it is supposed to contain under its roof twelve or thirteen sanctuaries, or places, represented to have had some particular actions done in them, relating to the death and resurrection of Christ. These are in order as follows, for we did not see any more:

1. The place where he was derided by the soldiers.
2. The place where the soldiers divided his garments.
3. Where he was shut up while preparations were made for his crucifixion.
4. Where he was nailed to the cross.
5. Where the cross was erected.
6. Where the soldier stood when he pierced his side.
7. Where his body was appointed in order to his burial.
8. Where his body was laid in the sepulchre.
9. Where the angel appeared to the women after the resurrection.
10. Where Christ appeared to Mary Magdalene.

The places where these and many other things relating to our Saviour were done, are all supposed to be contained within the narrow precincts of this church, and are all distinguished and adorned with funeral altars.

In the galleries round the church, and also in little buildings adjoining to it on the outside, are separate apartments for the reception of friars and pilgrims, and in these places almost every Christian nation maintained a small society of monks, each society having its proper quarter assigned it by the appointment of the Turks; but they have all, except four, forsaken the place, not being able to support themselves under the severity of the Turkish extortions. The Latins, Greeks, Armenians, and Coptics, keep their footing still; but the Coptics have only two or three poor monks; and the Armenians have run so much in debt to the Turks, that probably in a short time they will likewise dwindle away to nothing.

Besides these several apartments, each fraternity has its altars and sanctuaries, where they are permitted to perform divine service, according to the forms laid down in their own liturgies, and to exclude all other nations being present, according to the will of the monks. But the great prize contended for by the several sects, is the privilege of being considered as the chief who have a right to enter first into the holy sepulchre; a privilege contested with so much animosity, especially between the Greeks and Latins, that in disputing which party should go first into it to celebrate their mass, they sometimes proceed to blows, and the guardian of the Latins shewed us a great scar upon his arm, which he told us was the mark of a wound given him by a sturdy Greek priest in one of these unchristian skirmishes. These practices were carried to such a height, that the French king interposed, and sent a letter to the Grand Signor, requesting him to order the Holy Sepulchre to be put into the hands of the Latins, and they only are permitted to say mass at present in it, all other Christians being only suffered to go in to view the curiosities.

The daily employment of these monks who reside here, is to trim the lamps, and visit the sanctuaries from time to time, accordingly as prescribed by their superiors. Thus they spend their time, sometimes for four or five years together; and so far are they transported by the pleasing contemplations they entertain with themselves, that they never come out till they are either commanded by their superiors, or taken away by death. There are always ten or twelve Latin Monks belonging to this church, who reside constantly here, with a president over them, and make every day a solemn procession to all the sanctuaries and altars, every one singing a Latin hymn, the subject of which relates to each place. As they are much more polite, and more exact in their devotions than the rest, so we shall confine our account of the ceremonies to what is practised by them.

At the setting in of the evening, all the friars and pilgrims assembled together in the chapel of the Apparition, a small oratory on the north side of the holy grave, in order to go in procession round the church; but before they set out, one of the friars preached a sermon in Latin in the chapel. The moment he began his sermon, all the candles were put out; so that we were kept above half an hour in the dark. Sermon being ended, every person present had a lighted taper put into his hand, as if it were to make amends for the former darkness; and the crucifixes and other utensils were dispersed in order for bringing on the procession.

Amongst the other crucifixes was one of a very large size, which bore upon it the image of our Lord, as big as the life. This image was fastened to the cross with great nails covered with thorns, and besmeared with blood; and it was such a piece of workmanship, that we could not view it without a sensible emotion. This was carried at the head of the procession, and the company followed after it to all the sanctuaries of the church, singing a Latin hymn at each.

The first place they visited was the pillar where our Lord was scourged, a large piece of which is kept in a cell, just beside the chapel of the Apparition. Here another friar preached a sermon in Spanish, the subject of which was our Lord's sufferings. From thence they proceeded to the sanctuary, where another friar preached in French. And from the prison they went to the altar, where the soldiers divided our Saviour's garments, where they only sung a Latin hymn. From this place they advanced to the chapel of Derision, where a fourth sermon was preached in French.

From thence they went up to Mount Calvary, leaving their shoes at the bottom of the stairs; and here we saw two altars which the monks visited, one where our Lord is supposed to have been nailed to the cross, and the other where the cross was erected. At the former of these they laid down the large crucifix upon the floor, and performed some ceremonies resembling the procession of the crucifixion; after which a hymn was sung in Latin, and a sermon preached in French. Adjoining to this is an altar where it is supposed the cross was erected; and there is a hole in the rock which they confidently affirm to be the place where the foot of the cross was fixed.

Here they set up the crucified image; and the prior of the convent preached a sermon in Italian. At about a yard and a half from the place where the foot of the cross was fixed, is shewn that cleft in the rock occasioned by the earthquake, which happened when the God of Nature, Providence, and Grace was crucified; when the rocks rent, and the graves were opened. This cleft appears to be about a span in breadth at its upper part, and it closes at about the depth of two spans; but it opens again below, and runs to an unknown depth in the earth. There is only a tradition to prove that this breach in the rock was made by the earthquake that happened at our Lord's passion; but that it is a natural breach, and not made by any art, the sense and reason of every thinking man who sees it may convince him; for the sides of it tally with each other. Nature and art are easily distinguished from each other; and had this rent been counterfeited by art, we should have seen some marks of the chissel; but here there are none, the whole being natural and simple.

As soon as the ceremony of the passion was over, two venerable friars approached; one of whom personated Joseph of Arimathea, and with a solemn air of concern pulled out the nails, and looked down on the feigned body from the cross. It was so well contrived, that its limbs were as flexible as if it had been real flesh; and nothing could be more surprising than to see the two pretended mourners bend down the arms which were before extended, and dispose them upon the trunk in such a manner as is usual with dead corpses. The body was now received in a fair, large winding-sheet, and carried down from Mount Cal-

vary, the whole company attending as before to the stone of unction. This is taken for the very place where the body of our Lord was anointed, and prepared for the burial. Here they laid it down; and casting over it several sweet powders and spices, wrapped it up in the winding-sheet. Whilst this was doing, they sung a proper hymn, and afterwards preached a funeral sermon in Arabic.

These ceremonies being over, they laid the supposed corpse in the Holy Sepulchre, there to remain till Easter-day in the morning. After attending so many services, and such a number of ceremonies, we found ourselves so much fatigued, that we were glad to get a little rest.

The next morning we found the monks employed in making the insignia of the cross, and the name of Jesus upon the arms of the pilgrims.

The artists, or monks, who conducted this operation, do it in the following manner: They have stamps of wood, containing a variety of figures, and these are of different sizes. These stamps are dipped in powder of charcoal, so as to mark the arms. Then they take two fine needles tied together, the points of which they dip into a certain composition of gall, gum, powder, and some other articles, and with the points make gentle punctures along the lines of the figure, and then washing that part in wine, the whole work is concluded.

Here we continued till Easter-Sunday in the morning, when we found the sepulchre again set open, and the friars appeared as chearful as if there had been a real resurrection. Nor was their joy feigned, whatever their mourning might have been before; for as their Lents are kept very strict, so when they are over, the poor priests are glad to be again permitted to partake of good cheer.

Mass was celebrated in the morning before the Holy Sepulchre, being the most eminent place in the church. Here we found a throne erected for the father-guardian, who was dressed like a bishop; and in the sight of the Turks he gave the host to all that were disposed to receive it, not refusing it to children of seven or eight years of age.

This being ended, we left the church, and returned to the French church, where we dined in a most plentiful manner.

Dinner being over, we went to visit the most remarkable places in and about the city. Going first to a large grotto, where there is a college of Dervise; and the place is held in great reverence by the Turks, Jews, and Christians, as having been formerly the residence of the great prophet Jeremiah, who here wrote his Lamentations, and whose bed they shewed us on the shelf of a rock about eight feet from the ground. From thence we went to the sepulchres of the kings, which were certainly receptacles for the dead, formed at vast expence and amazing labour; but why termed the Sepulchre of the Kings, is a question hard to be resolved, no kings either of Judah or Israel, mentioned in scripture, being buried here, unless this was the burial-place of King Hezekiah, and that here were the sepulchres of the sons of David, mentioned in the second book of Chronicles.

We approached them at the east end through an entrance cut out of the natural rock, which admitted us into an open court of about forty paces square, cut down into the rock, with which it is encompassed instead of walls. On the south side of the court is a portico, nine paces long, and four broad, hewn likewise out of the natural rock. This has a kind of architrave running along it in front, adorned with sculptures of fruits and flowers, still discernible, though much mutilated and defaced by age, and perhaps by men's hands. At the end of the portico, on the left hand, we descended into the passage leading to the sepulchres. The door is now so obstructed with stones and rubbish, that it is somewhat difficult to creep through it. But within there is a room about eight yards square, cut out of the natural rock. The sides

The sides and ceiling, with the angles, are so regularly executed, that the most ingenious artists could not have done them better.

From this room we passed into six other rooms, each beyond the other, and all cut in the same manner as the first. Of these, the two innermost are deeper than the rest, having a second descent of six or seven steps; and in each of them, except the first, we found coffins of stone placed in niches along the sides of the walls. They had been covered with curious stone birds, but most of them have been destroyed by sacrilegious hands. The sides and ceilings of the walls were continually dropping with wet, and in former times there had been passages here to drain off the water. There is only one door remaining to any of these subterraneous passages; it is cut out of one entire stone, and formed like wainscot; and, what is more remarkable, that the hinges of the door are also of stone.

In returning from these sepulchres to the city, we were shewn a filthy dungeon, in which it is said the prophet Jeremiah was kept prisoner, by order of king Zedekiah. The following day the pilgrims, to the number of two thousand, were conducted to Jordan by the governor of the city; and several bands of soldiers for their protection; every layman pays twelve franks, and every priest pays six; for without such a guard none could travel, because the country is extremely infested by the Arabs.

Crossing the valley of Jehoshaphat, and part of mount Olivet, we arrived in half an hour at Bethany, the first house in which village is supposed to have belonged to Lazarus and his sisters; and near it is shewn the sepulchre, where it is said he was raised from the dead. We descended to it by twenty-five steps, and arrived first in a small square room, through which we passed into one something less, and here the body is said to have been laid; we were obliged to pay a small tribute to be admitted into it, and the Turks, who use it for an oratory, hold it in great veneration.

At the bottom of a steep hill we came to the Apostles Fountain; so called because, it is said, the apostles refreshed themselves here when they went to or returned from Jerusalem. Nor is this in the least improbable, because it stands near the road leading from Jerusalem to Jericho, and bubbles out a clear stream, which in that country is very refreshing. The mountain, where it is said our Saviour was tempted of the devil, lies through an intricate road, variegated with hills and dales; and, though at present extremely barren, wears the aspect of a place that had been formerly cultivated. The whole prospect is most dismal; presenting nothing but rocky mountains and frightful chasms, that appear to have been the effect of some striking convulsions in nature. In a deep valley to the east are some ruined cottages, which were formerly the habitations of devout pilgrims, who certainly never could have pitched upon a spot more rueful and melancholy than this, it being enough to fill the mind with horror to view it at a distance. From the top of one of the rocks there is a beautiful prospect of the mountains of Arabia, the Dead Sea, and the plains of Jericho. Quarantani is the name of the hill where it is said our Saviour conversed with the devil; and on it is a small chapel, but we found it would be difficult to visit it, because there were a great many Arabs there at the time.

These Arabs had the insolence to demand two hundred dollars from us, but the governor of Jerusalem drove them off with disgrace, but would not take any of them prisoners.

From hence we turned towards the plain of Jericho, and arrived at the fountains of Elisha, which that prophet purged of its bitterness at the request of the neighbouring inhabitants. These waters falling into a neighbouring basin, diffuse themselves over the adjacent fields, which they render extremely fertile. Just besides the fountain is an umbrageous tree, under which we dined, being accompanied and conducted to

it by forty friars. From hence, about the distance of two miles lies Jericho, so often mentioned in scripture, but at present only a mean contemptible village, inhabited by Arabs.

The next day we proceeded on to Jordan through a plain, that produced nothing but samphire and other marine plants. Here in many places where the water has been dried up, several creeks of salt are still to be seen, for with this mineral the rock seemed to be every where impregnated.

Here we saw the ruins of an old convent, and a church dedicated to St. John the Baptist, lying about a furlong from the river, and near the place where that holy prophet baptized the son of God. On the banks of the river we were intimidated by the appearance of Arabs, who fired upon us from the opposite shore, but it was happily at too great a distance to do any mischief.

The intimidation wherewith this savage parade filled our friars, who were the most wretched of the whole company, is really surprising. The desperadoes having soon after retired, many of the pilgrims stripped, and washed themselves, but dared not venture to swim across the stream; first, on account of its violent rapidity; and secondly, because of the Arabs. The pilgrims having finished their devotions, and satisfied their curiosities, were ranged in the middle of the plain, that the governor being thereby the better able to number them, might not lose any of his tribute. Some of us having expressed a desire of viewing the Dead Sea, the governor not only permitted us, but likewise sent a guard for our protection, an instance of generosity which we returned with suitable marks of gratitude.

Within half a mile of the Dead Sea are several pits of salt, much resembling lime-kilns; and it is probable that in this place the kings of Sodom and Gomorrah were overthrown, as mentioned in Gen. xiv. In a coppice near the sea, our guide, who was an Arab, pointed to a fountain, the waters of which he told us were fresh, although we found them brackish and bitter.

To the east and west, the Dead Sea is bounded by mountains of a stupendous height; on the northward lies the plain of Jericho; and to the south it stretches farther than we thought it safe to proceed. The length of it, upon the best information we could procure, is little more than seventy miles, but the breadth does not exceed six or seven. It ought rather to be called a lake than a sea; and in the mountains around it, the stones dug up, when thrown into the fire, emit a most intolerable smell. It admits of a polish equal to black marble; and there are several pieces of it kept in the convent of St. John the Baptist, already mentioned.

It is well known that several travellers have asserted that birds cannot fly over this sea; but as soon as they are over it, fall down into the water, being sufficated with the smell of the sulphur. This, however, is absolutely false; for we tried the experiment several times, and the birds flew over it in the same manner as they would over any water whatever. Nay, we saw some oyster-shells on the shore, from which circumstance we concluded that there are other fish to be met with here. Over the surface of the water, near the shore, is a thick bitumen, which cannot be easily distinguished from pitch; and the waters are bitter and nauseous, being of such strength, that they will bear a body of considerable weight. We searched in vain for the remains of those cities so signally destroyed for their abominations (Gen. x. 9.) but the guardian of the Holy Sepulchre assured us, that something of that nature was frequently seen when the waters were low. Here we could not find any trees; which confutes what some travellers have said concerning the apples of Sodom.

A little to the westward is a promontory, where it is said Lot's wife was turned into a pillar of salt; but we had no time to visit, nor does it appear that there are at present any remains of that signal act of divine justice. We may not doubt the truth of the scripture account of this remarkable affair; but then it should be

considered that it is no where said in scripture that this pillar was to remain till the end of time. And it is not a little remarkable that our Saviour did not tell his disciples to go and look at it, but only said, Remember Lot's wife.

In our return from the Dead Sea, we passed by an old Greek church, where were several rude paintings, particularly one over the altar, representing the last supper.

All along as we travelled here, the smell of honey was so strong that there must be a great deal of it on the spot; but it is lost for want of proper cultivation. There were vast numbers of bees, so incessantly engaged in labour, that even the most indolent of the human species might, on viewing them, have been taught industry.

Having rested about six hours in our tents, we set out at half an hour after two in the morning. About ten in the forenoon we joined the rest of the pilgrims, and continued our march till we came to the walls of Jerusalem; but instead of entering that city, we turned off towards Bethlehem, passing a second time through the vale of Jehoshaphat. In this road we were shewn several very remarkable things, which we shall take notice of in the order they presented themselves to us.

The first of these was the house of good old Simeon, who took our Saviour in his arms in his temple, and blessed God for the appearance of the hope of Israel, so long expected, and so earnestly wished for.

The second was the famous turpentine tree, under which the Virgin is said to have rested herself, when she went to present the Redeemer of mankind in the temple.

Thirdly, here is a convent belonging to the Greek monks, who shewed us a hard, rough stone, with the impression of a man's body upon it, and this they told us was a bed on which the prophet Elijah often reposed himself.

Fourthly, we were here shewn the tomb of Rachel; but it had all the appearance of a modern structure, although it is not at all improbable but that it may have been built on the spot where the original one stood. Near it are picked up small stones in the shape of pease, and which, according to tradition, were once pease; but they were burnt, because the proprietor of the field refused to give some of them to the Virgin Mary when she was travelling this way, previous to her delivery.

About three miles to the south of Bethlehem, lie those beautiful gardens and celebrated pools which are still considered as the works of the wise king Solomon, and which he enumerated among the other pieces of his magnificence, as we read at large in the book of Ecclesiastes. In returning from these remains of grandeur and antiquity, we passed by an old aqueduct, which was certainly the work of king Solomon; and notwithstanding its prodigious strength, the Turks have demolished the greatest part of it. Here is the grotto wherein Joseph and Mary resided while they continued at Bethlehem, and where they concealed themselves to avoid the fury of Herod, when he ordered all the children to be murdered. The women here take the earth of the grotto, and, having infused a little of it in wine, drink it, in order to increase their milk, imagining that the whiteness of it proceeds from some drops of the Virgin's milk, which fell from her breasts while she was suckling the infant, and not from any natural cause. And such is the strength of prejudice upon weak minds, that when any of these women have milk more plentifully than others, they are sure to ascribe it to this earth.

Friday, April the 2d, we left the famous village of Bethlehem, intending to return to Jerusalem, after visiting the convent of St. John the Baptist, and the wilderness. In our first stage, we crossed the famous valley where the angel destroyed the whole Assyrian army, under the command of Sennacherib; and in an hour more we arrived at a small village, where it is said no Turk can live above a day.

It is very probable this story was invented by the

Greek Christians, in order to keep the place entirely to themselves; but whatever truth may be in that, certain it is, the Turks will not try the experiment.

A little further on is a fountain, where they told us Philip baptised the eunuch; but unless the face of the country has been much changed since that time, it must be false, because the road near it is so steep, that it will hardly admit a horseman, and much less a chariot. However, we are not to form a judgment of what the road once was, from its present appearance; for it is certain there was another not far from the fountain, which was both spacious, and in all respects convenient, but it has been destroyed by the Turks.

A little beyond this fountain lies a village called St. Philip's, where ascending a steep hill, we arrived at the wilderness of St. John, which although rocky and mountainous, yet is well cultivated, and produces plenty of corn, grapes, and olives. Here we were shewn the cave where it is said John the Baptist submitted to all those austerities which we find recorded in Matt. iii.

About three miles to the eastward lies the convent of St. John, towards which we directed our course, travelling through the valley of Elah, where David slew Goliath of Gath, the champion of the Philistines; and here we had a distant prospect of the burying-place of the Maccabees. Near the convent of St. John there formerly stood another convent dedicated to the memory of his mother Elizabeth, having been once her habitation. It is now in ruins, only that there is still a grotto, where it is said Mary saluted Elizabeth, and burst out into the divine Magnificate.

The convent of St. John, which is now inhabited, stands about three miles from the house of Elizabeth, and is supposed to have been built on the spot where John was born. We asked the Greek Christians how it happened that Elizabeth resided in one house when she was visited by her cousin Mary and in three months afterwards was delivered of St. John the Baptist in another house? They were ready enough to give us an answer; for they told us that she had two houses, one for the summer, and the other for the winter.

During the wars between the Christians and the Saracens, this convent of St. John suffered much, and was at last found to be in such a ruinous condition, that it was found necessary to rebuild it about four years before we visited this part of Asia. It is a large beautiful square; but that which most strikes our attention in it is, the church, which consists of three ailes, with a handsome dome on the middle of the roof, and a fine marble pavement below.

At the upper end of the north aisle we ascended by seven steps of polished marble to a splendid altar, where they told us St. John was born. We found several artificers employed in adorning this structure, and adding many embellishments to the convent; but the expence has become so great, that the poor friars are hardly able to go through with it.

Not far from it is a neat, little convent, dedicated to the Holy Ghost, and it is said to be built on the same spot where the tree grew upon which our Lord was crucified. The whole in which the stump of this tree grew, is under an altar, and with great respect and reverence shewn to strangers.

The evening of this day we returned to Jerusalem, having been five days absent, and were invited to the convent to have our tents washed along with the rest of the pilgrims. This ceremony was performed by the altar-guardian himself, with great solemnity; after which each of the friars kissed our feet in a very respectful manner, a ceremony designed to promote humility, and stir up charity.

During this night, being much fatigued, we took a little repose, and in the morning went to see the holy fire of the Greeks. This ceremony is kept up by these people, as well as by the Armenians, upon a persuasion that on every Easter-eve a miraculous flame descends from heaven into the Holy Sepulchre, where it kindles all the lamps and candles in the same manner as the sacrifice was burnt up by fire from heaven, when

the prophet Elijah prepared for that manifestation of the divine power, Kings xv. 3. We found the church of the Holy Sepulchre crowded with a tumultuous and distracted mob, making a hideous noise, more like brutes than Christians, and crying out, *Huia*, which signifies the coming of Christ; and to these they added many other ridiculous ceremonies.

Sometimes they dragged one another along the floor all round the sepulchre; and in this tumultuous, frantic manner, they continued from twelve at noon till four o'clock in the afternoon; the reason of which was, there was a suit depending between the Greeks and Armenians, concerning precedency, and this was to be determined by the Cadi, who is the same as one of our civil magistrates. The dispute cost them above five hundred dollars, and at last the cadi ordered that they should enter the Holy Sepulchre here together, without either claiming the precedency. Here was an instance of Turkish prudence, which ought to be imitated by all the Christian nations in Europe. For when bigots will contend about trifles, it is the duty of the civil magistrate to despise their ignorance, and laugh at their folly.

About four o'clock the Greeks began the procession, and were followed by the Armenians, both parties being magnificently habited, and bearing standards, streamers, crosses, and crucifixes, with a great many more signs of the most insignificant pageantry, with which true religion has no connection.

In this order they walked round the holy sepulchre three different times, and towards the end of the procession a pigeon came flying into the dome over the sepulchre; at sight of which there was a great shout. The Latin Monks found the bird had been purposely let fly by the Greeks, to deceive the people into an opinion, that it was the Holy Ghost.

These squabbles between the Greeks and Latins are so common, that travellers never concern themselves about them; and to the Turks they afford matter of laughter and ridicule. These Mahometans, who know but little of religion, and still less of religious disputes, often wonder why Christians should come to Jerusalem under the mask of piety, while at the same time they take pleasure in tormenting each other.

The procession being over, the suffragan of the Greek patriarchs, and the Armenian bishops approached the door of the sepulchre, and breaking the strings which was fastened and sealed, entered in, shutting the door after them; all the lamps and candles within having been before extinguished in presence of the Turks.

They had not been above a minute in the holy sepulchre, when the glimmering of the holy fire was seen through some chinks of the door, and out came the two disguised priests with blazing torches in their hands, which they held up at the door of the sepulchre, while the people thronged about with inexpressible ardour, every one striving to obtain a part of the first and purest flame.

The Turks, in the mean time, laid upon the populace with huge clubs without mercy, but to no purpose, they were not to be kept back; the excess of their enthusiasm made them forget, or rather not feel pain. Those that got the fire, applied it immediately to their beards, faces and bosoms; pretending it would not burn like an earthly flame, yet it appeared evident that few of them could bear the experiment. As all pressed to light their tapers, it was not long before the church was illuminated, and thus the ceremony ended.

It must be acknowledged that the Latin priests within the sepulchre performed their parts with dexterity; but there was no such thing as suffering the rabble without. All was riot and confusion, and had more the appearance of a puppet show, than any thing that related to religion.

The Latins take a great deal of pains to expose this ceremony as a shameful imposition, and a scandal to the Christian religion; but this we may suppose arises from motives of envy, because they are sorry to find, that

the Greeks and Armenians run away with so much of what they consider as their own emoluments. But the last-mentioned party are not to be baffled, for they make their pilgrimages under pretence, that unless they were to do so, the Latin priests, as arrant cheats, would run away with all the profits.

Going out of the church, we saw a vast number of people assembled together, melting their wax tapers upon pieces of linen, which were intended for shrouds; and these poor creatures imagine, that such sort of an embalming will protect them, when dead, from the pains of hell.

This is not at all inconsistent with the notions of the Roman Catholics in Europe; and with respect to the Greeks, they have believed and professed such ridiculous nonsense upwards of a thousand years. We looked upon them with pity, and left them with wishes for their reformation.

April the 4th, being Easter Tuesday, in the Old Style, as we keep it in England, we spent the whole day in our private devotions, except what was appropriated for meals and friendly conversation. On Monday we went to visit such places as we had not hitherto seen; and among these, the first we were introduced to, was the prison where the angel appeared to St. Peter, and delivered him when he was condemned to be put to death by Herod; and this place is still appropriated for the confinement of criminals.

About a furlong from thence we came to an old church, built by Helena, mother of Constantine the Great, in the place where stood the house of Zebedee. The Greeks have this in their possession, and they told us that Zebedee was a fisherman, who brought fish to a market in Jerusalem.

There is nothing at all doubtful in this, for we are assured that his children were fishermen; and why then should not the sons follow the same employment? No honest employment was disgraceful among the Jews; but it was scandalous for a man, let his rank be ever so high, not to have a visible way of procuring a subsistence.

Near this place they shewed us the gate, which, according to their tradition, opened to Peter of its own accord; but there appeared to us such weakness and inconsistency in this story, that we could not pay any regard to it. A few steps further, we came to a small church, which they told us was built on the spot where St. Mark's house stood, where Peter went after his miraculous delivery.

The Syrians, who have this place in their custody, pretended to shew us the very window out of which Rhoda looked while Peter knocked at the door. In the church they shewed us a Syrian manuscript of the New Testament in folio, pretended by them to be above eight hundred years old; and, to enhance the sacredness of the place, a font out of which the Apostles themselves baptized.

To these traditions we could not give any credit, for although it is very evident the events took place here; yet there have so many revolutions happened, that it is in a manner impossible to fix upon local situations. Wars and tumults overturn the monuments of antiquity, therefore we must look for them in the dark.

A little further on in the same street, is the house said to be that in which St. Thomas resided, where there was formerly a church, but it was converted into a mosque. Perhaps the Mahometans honour this place, because it was difficult to persuade St. Thomas of the belief of our Saviour's resurrection. Not many paces further is another street, crossing the former, which leads on the right hand to the place where they say our Saviour appeared to the women. The same street carried us into the Armenian convent, where they have a large and delightful spot of ground laid out into a garden; for their convent and garden takes up all that spot of Mount Sion which is within the walls of the city. And their church is built where they say St. James, the brother of St. John, was beheaded.

In a small chapel, on the north side of the church, is still shewn the spot where they say he was beheaded; and

and in this church are two altars decorated in the most splendid manner, being decked with mitres, embroidered caps, chalices, and other church utensils without number.

In the middle of the church is a pulpit made of tortoiseshell and mother-of-pearl; with a canopy over it of the same materials. The tortoiseshell and mother-of-pearl are nicely joined together; and in a kind of antique chapel in this church, are laid up on one side of an altar three large rough stones, esteemed very precious, one of them being considered as the stone upon which Moses cast the two tables of the law, when he broke them to pieces in consequence of that indignation which arose in his mind; when he found they had committed idolatry. With respect to the other two, one they say was brought from the place of our Lord's baptism in Jordan, and the other from the place of his transfiguration on the mount.

Seeing this convent; we went a little further, to a small church which was likewise in the hands of the Armenians; and this is supposed to be built on the place where the house of Ananias stood. Within the church, not far from the door, is hewn a hole in the wall, denoting the place where one of the servants of the high priest smote our Saviour; but this is likewise conjecture.

The Jews told us, that this officer by whom the impious buffet was given, was the same Matthias whose ear Peter cut off, and which was immediately healed by our Lord.

This may be true for any thing we know, so that we shall not insist on it. Near this chapel is an olive tree, to which they told us Christ was chained by order of Ananias, to prevent him from making his escape.

We were now conducted out of Zion gate, which is near adjoining to the place where they told us the house of Caiaphas stood; and where is another small chapel belonging also to the Armenians. Here, under the altar, is deposited, as they believe, the very stone which secured the door of our Lord's sepulchre. It was kept many years in the church of the sepulchre, but the Armenians stole it away many years ago, and lodged it in this place. This stone is two yards and a quarter long, and one yard broad, and plastered all over, except in some places where it is worn bare by the kisses of pilgrims.

There is likewise shewn a cell, said to be our Lord's prison during the night, till he was carried before Pilate the Roman governor in the morning.

A little without the gate is a small church, which, according to prediction, is built on the spot where our Saviour instituted the last supper; but it is now a mosque, and Christians are not permitted to come into it.

Near this is a well, where it is said the apostles took leave of each other when they went to propagate the gospel throughout the world; and near it are the ruins of a house, where it is said the Blessed Virgin breathed her last. Going a little eastward down the hill, we were shewn the place where a Jew arrested the corpse of the Blessed Virgin, as they were carrying her to the place of interment; for which impious presumption his right hand was withered ever after. In the midst of the hill they shewed us the place where Peter wept, in consequence of having, in the most ungrateful manner, betrayed his Lord and Saviour.

Having walked round the greatest part of the city, we returned again by the gate of Zion, where turning down by the right we came to a garden, situate at the foot of Mount Moriah, where we were shewn several large vaults, running at least fifty yards under ground. They were built in two ranges, arched at the top with hard stones, and sustained with tall pillars, consisting each of one large stone, two yards in diameter. This was probably some work made to enlarge the area of the temple; for in scripture we read of something like it; and indeed the situation of the ground does not in the least prejudice the sentiment.

From these vaults we returned towards the convent,

and in our way saw the beautiful gate of the temple; but we could only see it; for the Turks are so scrupulous, that they will not permit any person to come near it.

The next morning we began a new progress around the city, and came back to Bathsheba's pool; supposed to be the place where that beautiful woman washed herself when the Royal Psalmist first took notice of her from the terrace of his palace. It is true, others have placed this pool at a considerable distance from the palace here mentioned; but when we consider where David's palace was, and that there were bathing pools erected, we cannot hesitate one moment in declaring, that it was in this place that enamoured monarch first beheld this beautiful woman.

A little further we entered into the valley of Hinnom, that dreadful place where the idolatrous Jews offered their children in human sacrifices to Moloch. On the west side of this is the Potter's Field, which was of old called Aceldama, or the Field of Blood, from its being purchased with the thirty pieces of silver which were given by the Jewish Sanhedrim to Judas for betraying Christ. It is a small piece of ground, not above thirty yards long, and about half as much in breadth. One half of it is taken up by a square fabric, twelve yards high, built for a charnel-house. The dead bodies are let down into it from the top, there being five holes left open for that purpose; and looking down through these holes we saw several bodies not yet decayed. The Armenians have the chief property in this burying ground, but for that they are obliged to pay the Turks a considerable tribute. From this circumstance we learned, that although these men assume the name of Christians, yet they have no Christianity among them. Pride is their predominant passion; and by that all their actions are governed.

A little below the Field of Blood, now called the Campo Santo, is shewn a cave cut out of the solid rock, where it is said the Apostles hid themselves when they fled from Jesus. The entrance of this cave discovers signs of its having been formerly painted. The valley of Jehoshaphat runs along by the north of Hebron, and is watered in winter by the brook Cedron; but the stream was quite dried up while we were there. Here is to be seen the well of Nehemiah; and a little farther on the left hand we were shewn the place where, according to tradition, the evangelical prophet Isaiah was slain. About one hundred paces higher, on the same side, is the Pool of Siloam, where there was formerly a church; but now it is used by a tanner to work his hides.

About a furlong further is the fountain of the Blessed Virgin, so called because she was wont, as it is reported, to resort hither for water. Over-against the fountain, on the opposite side of the road, is a village called Siloe, where it is said Solomon built a house for the reception of his strange wives; and above this is a hill called the Mountain of Offence, because Solomon built here his idolatrous altars.

A little further, on the same side of the valley, are several Jewish monuments, and amongst them two of great antiquity. One of them is called the Sepulchre of Zachary, and the other the Pillar of Absalom; and close by the latter there is shewn the sepulchre of Jehoshaphat, from whence the whole valley takes its name. Upon the edge of the hill, on the opposite side of the valley, there runs along, in a direct line, the wall of the city, near the corner of which there is a short end of a pillar jutting out of the wall. Upon this pillar the Turks have a tradition that Mahomet will sit in judgment at the last day, and that all the world shall be gathered together in the valley below, to receive their doom from his mouth.

A little more to the northward is the gate of the temple; but it is walled up, because the Turks have a tradition that their destruction shall begin here; and it is curious to hear the reasons they assign for this very unaccountable notion; but more particularly those for preventing the dreadful catastrophe from taking place. Below this gate, at the bottom of the valley,

is a broad hard stone, discovering several impressions upon it, which have the appearance of footsteps; and these, the friars told us, were the prints made by our Saviour's feet, when after his apprehension he was hurried away to the tribunal of his bloody persecutors. A little further we came to the sepulchre of the Blessed Virgin, for they have a tradition that she was buried here; it has a magnificent descent of forty-seven steps. On the right hand going down is the sepulchre of St. Anne, the mother of the Virgin, and on the left that of Joseph. Going up the hill towards the city, we were shewn the stone where it is said St. Stephen suffered martyrdom; and not far from it is a grotto, where it is said the outrageous Jews threw the mangled body, after they had stoned it to death. From thence we returned to the city, and spent the night quietly in our lodgings.

Next day we visited several grottoes, called the Sepulchres of the prophets; and a little further we saw the remains of a church on the top of a hill, where it is said our Lord ascended into heaven; and this structure was built, in memory of so remarkable an event, by one of the Greek emperors.

At present all that remains of this church is the cupola, which is an octagon, and beneath it is shewn a stone, on which it is said the Son of God stood when he blessed his disciples, and was taken up into heaven. On this stone is the print of a man's foot still visible; and there were formerly two, but the other has been removed by the Turks, and placed in one of their mosques. The chapel of the ascension is likewise turned into a mosque; and the Turks have a very celebrated one on Mount Moriah. Here are several other places near Jerusalem, which the Turks have engrossed to themselves, under pretence of keeping them in the highest state of veneration; but their real design is to extort money from the Christians. About two miles to the northward is the highest part of Mount Olivet, and from it is a fair prospect of the city of Jerusalem. This is the place where the two angels appeared to the disciples after our Saviour's ascension; and here a tower was afterwards built, but some years ago a Turk having purchased the place, caused it to be totally destroyed; so that no remains of it are now left.

We descended by a road different from that by which we had gone up, and at the bottom of the hill is a stone, upon which the Virgin dropped her girdle, at the time of her assumption, in order to convince St. Thomas of that miracle, who, it seems, was incredulous more than once. There is an impression of a girdle upon the stone, but it seems to have been made in latter ages, and may be reckoned among the number of that sort of trumpery which constitute what we call pious frauds, alluding to the practice of the Roman Catholics. A little further, we came to the valley of Gethsemane, which is only a small place; but made famous by our Redeemer's sufferings. Here it was that his agonies began, here he looked backward upon all those crimes committed by the human race; he knew the ransom he was to pay for them, and so dreadful was the agony, that he sweated blood.

At present the valley of Gethsemane is well planted with olives, which are not only useful to the inhabitants, but are likewise a valuable article of commerce. They sell them to the Spanish merchants, and it is well known how fond these people are of that fruit.

At one corner of Gethsemane is a small rock, where it is said Peter, James, and John slept during the time of our Saviour's agony; and near it is a small piece of ground, where it is said Judas betrayed our divine Redeemer; and what is very remarkable, the Turks have caused this spot of ground to be separated from the rest of the garden; holding in detestation, even as much as Christians, such an infamous piece of treachery.

Near the gate still called St. Stephen's, we were shewn an old house, inhabited by a Turk of some rank; and although there was nothing in it remark-

able, yet we were told that it was the same place where Pontius Pilate resided at the time he pronounced sentence of death on our Saviour.

From the terrace adjoining to this house, we had a fine prospect of all that spot of ground upon which the temple was built: and this is the last prospect that can be seen here; for no Christian is allowed to go any farther without either renouncing his religion, or being impaled alive. The architecture of this building is extremely august, and there is something magnificent even in its first appearance. It lies on the top of Mount Moriah, overagainst, and near adjoining to Mount Olivet; and here we saw some remains of the ancient Jewish grandeur.

In the middle of the area at present stands a Turkish mosque, which seems to have been erected on the remains of a Christian church. And we were told that this place was the spot where the Holy of Holies was erected. In this pretended house of Pilate, (for we know nothing of its certainty) is shewn the room where Christ was confined, till Pilate had deliberated on his judgment; and this was the place, according to tradition, where the Roman soldiers treated our Saviour with all those indignities which have been reported to us consistent with truth in the sacred scriptures. On the other side of the street, where they say was part of the palace cut out by Herod, and where there are considerable shews. They still shew us the place where our Lord was scourged. This was once used as a stable for horses by some of the bashas of Jerusalem; but superstition gave a different turn to affairs; for a dreadful mortality took place, and many thousands died, merely because they were slaves to their own superstition.

Here we are naturally led to reflect on the fluctuating state of human affairs. There is, in the conducting of them, such a display of infinite wisdom as no man can fathom; and nothing less than a measure of the same infinite wisdom can teach men the true art of humility. All is right that is conducted on principles of equity, justice, and honour; and all is wrong where we find the reverse.

In our return from Pilate's palace, we passed along the dolorous way, and were shewn first the place where Pilate shewed to the Jews our Lord, endeavouring to prevail upon the people to acknowledge his innocence, making use of those emphatic words, **BEHOLD THE MAN!** Secondly, the place where Christ fainted under the weight of his cross. Thirdly, where they say the blessed Virgin fainted away, when she beheld the sufferings of her Son. Fourthly, where St. Jerome presented the handkerchief; and lastly, where the soldiers compelled Simon the Cyrenean to bear the cross.

Friday April 9th, we took a view of the pool of Bethesda, which is one hundred and twenty paces long, forty broad, and eight deep. There are still some old remains of arches over it; but while we were there the water was dried up. Near it is a small convent, dedicated to Anna the prophetess, mentioned in Luke, chap. ii. and who the Roman-catholics would have us believe was the mother of the Virgin Mary; but this is one of the most barefaced falsehoods that ever was advanced.

First, this woman Anna had been a widow eighty four years; and, had Mary been her daughter, she must have been a very old woman indeed when she bore our Saviour.

Secondly, As it is expressly said that Anna was a poor old widow, and Mary a chaste young virgin, how can it be supposed that they did not know each other when they went into the temple with the child?

Lastly, To put the matter beyond all manner of dispute, this woman Anna is said to have been of the tribe of Asher, whereas both Joseph and Mary were of the tribe of Judah, and of the family of David. Here they shewed us a grotto, where they said the blessed Virgin was born; and at a small distance from it the house of the pharisee, where Mary Magdalene

lene washed our Saviour's feet with her tears, and wiped them with the hairs of her head. In the afternoon of this day we visited mount Gibeon, and the pool of the same name, which is one hundred and six paces long, and sixty-seven in breadth, lined with a stone wall and plaister, being well stored with exceeding good fresh water.

April 10, being the last day the holy sepulchre was to remain open during the festival, we paid our last visit to it.

The Turks call this the Day of Charity, because they permit every person to go in without taxing them; so that the poorer sort of pilgrims had now an opportunity of indulging their devotions; but we were told that some abandoned wretches laid hold of this opportunity to commit all sorts of lewdness.

From the eleventh to the thirteenth, we kept close within doors, to avoid the insolence of the Turks, it being what they call the feast of Byram, which succeeds immediately after their great feast Ramadan, or Lent. During this time they indulge themselves in all manner of licentiousness; so that it is very dangerous for Christians to be seen among them.

April the fifteenth, all the pilgrims and travellers were called together, when the guardian of the convent gave each of them a certificate that they had seen all the Holy Sepulchre, in and about Jerusalem. For this favour, and such others as we had received, each of us presented fifty dollars to the convent, and set out with the governor, who was on his return to his master the basha of Tripoli. We obtained this permission by means of a small present to the governor; and we found it the more necessary, because the roads were at that time much infested by Arabs, who were at war with each other; and when travellers pass through, they are generally taxed or robbed by both parties.

The governor was not only well acquainted with the roads, but he was likewise a man of integrity and prudence; for finding that the common roads were infested by swarms of Tartars, he turned off from them at the end of the first stage, and conducted us by another way. The country people were at this season every where employed in plowing the ground to sow cotton; and they used goads of an extraordinary size; some of them at least being eight feet long, and six inches in circumference. At the larger end was fixed a strong, small iron spade, for cleaning the plough from the earth that might happen to encumber it; and to the lesser end was fixed a prick, wherewith they drive the oxen; which employment, as well as that of holding the plough, was managed by one and the same person.

April the eighteenth we arrived at a large old town, called Jeneen, situated near the skirts of Esdralian, and is the chief residence of the emir of Chibly. By order of this magistrate we were obliged to remain all day, that he might have an opportunity of examining us, in order to fix the value of his tribute.

These things being adjusted, we were permitted to depart about midnight; and early the next morning we came to Nazareth. It is at present a poor, mean village, laying in a cavity, on the top of a steep hill, where there is a convent; and the poor friars entertained us with friendship and hospitality. These fathers lead a truly mortified life, being in continual fear of the Arabs, who swarm in numerous bodies all over the country.

The church of Nazareth is built in the form of a cross, but part of the main pillars have been broken down by the Turks, who imagined they should find some treasure concealed under them. The house of Joseph, wherein Christ lived till he entered upon his public ministry, is still shewed to travellers; and near it are the remains of the synagogue where he preached, as mentioned in Luke, chap. iv. All these places were formerly embellished and adorned by Helena, the mother of Constantine the Great; but at present there are few remains of her magnificence to be found.

Monday, April the nineteenth, we visited Mount Tabor, wherein it is said our Saviour was transfigured. It is steep; and hard to be ascended. The top of it was antiently well fortified, and to this day are to be seen the ruins of the walls and trenches. Here is a fertile piece of ground in the form of an area, deliciously planted round with trees, being open only to the south; and here are also several cisterns of good water, with three grottoes, in memory of our Saviour, and Moses and Elijah, the two great prophets who ministered to him.

There is one thing we took notice of in passing through this country; which has been wholly overlooked by other travellers; and that is, that all the historical events, as related in the Old and New Testament, are said to have happened in grottoes, or at least that grottoes are now erected on the places where they formerly stood. Thus when we inquired where every event happened, whether in the valley, or on the hill, we were still directed to a grotto; from which circumstance we may infer that grottoes were formerly in great esteem, or else they could never have been considered, in spite of all probability, as the places where transactions happened that required a very different situation.

Upon the whole, the only rational notion we could form was, that it was the practice of the hermits, during the times of persecution, to live in caves; and these, in more peaceable times, were turned into grottoes. In that manner they continued till the times of the crusades; and ignorance has dignified them with a sort of locality which has no foundation in truth.

From the top of Mount Tabor there is a prospect of the Mediterranean sea, and of many of the places where our Saviour wrought his miracles. To the eastward we saw Mount Hermon, at the foot of which our Lord raised the widow's son; and Endor, where Saul held a conference with the witch. Directly to the eastward, lies the sea of Tiberias, over which hangs a steep mountain, where it is said the swine perished, as mentioned by the Evangelist in Matthew viii. A little more to the northward, we were shewn the mountain where our Saviour preached his justly celebrated sermon, as recorded in Matt. v. vi. vii.

After dinner, we visited the Mount of Precipitation, down which our Saviour's neighbours would have thrown him, had he not made his escape in a miraculous manner.

On the twentieth we took leave of the guardian, after presenting him with two dollars apiece for his civility, and proceeded towards Accra, where we were handsomely entertained by the French consul, who took every opportunity to make our time as agreeable as possible.

He took us to see several caverns, cut out of the solid rock, about a mile from the sea; and these, upon the nicest inspection, appeared to have been habitations for the living, and not sepulchres for the dead. Who these subterraneous inhabitants were, is not easy to determine, nor in what age they lived. It is probable that they were either robbers, or persecuted people who took shelter there in order to avoid the iron hand of tyranny.

April the twenty-fourth, we began to climb Mount Libanus, which we found both steep and difficult. This took up the greatest part of a day; and the next morning, having crossed the highest ridge of this mountain, where the snow lay close to the road, we began to descend, and in two hours came to a small village, where a plentiful stream issues out of the solid rock, which seems a fine brook in an adjacent valley, and at last loses itself in the river Letane. Here we were obliged to pay a new tax; and had we not been formidable in our numbers, and resolute in our behaviour, the collectors would have imposed upon us in a most exorbitant manner.

On the twenty-sixth, we came to Dames, where we were obliged to pay another tribute; and from thence we continued our journey, till night overtook

us in a most uncomfortable place, where we could find no grafs for our horses, nor water for ourselves. Leaving this disagreeable spot, we next morning passed the river Barrady; over a new bridge. This river falls with vast rapidity from the mountains, fertilizing Damascus and all the neighbouring plains, which are so ravishingly delightful, and so exquisitely calculated for the indulgence of pleasure, that Mahomet having viewed them from the top of a high hill, would not march forward, lest he should have been assaulted with temptation, but returned, making use of this reflection: "There is but one paradise designed for man; mine shall not be of this world."

About three days journey to the eastward of Sidon; lies the famous city of Damascus, being about two miles in length, broad at each end, but rather contracted in the middle. All around it, and even within the walls, are some of the finest gardens that ever were seen, abounding with fruits, and watered with delightful showers.

Descending from this eminence, where we had a view of a terrestrial paradise, we were met by a janisary, dispatched for that purpose by the father of the Latin convent, and by him we were conducted into the city by a round-about way in the most private manner possible; being thereby secured from the insults of the inhabitants, who are the most wretched of bigots.

The walls of the garden all around Damascus are built of square pieces of earth, in the form of large bricks, laid on the top of each other, some of them being two yards long and more; some, one and a half in breadth. They scour the channels in their gardens by means of a great bough fastened to a yoke of oxen, and dragged along, while a heavy peasant sits upon it and presses it down to the bottom.

At the east gate of the city we were received by Father Raphael, the superior of the Latin convent, by whom we were accommodated with great civility; and indeed the Monks, wherever we found them, treated us with hospitality.

The streets of Damascus are very narrow, and the houses are built of bricks dried in the sun; so that when there is a brisk shower of rain, every passenger is up to the knees in mud. It is hard to imagine what could induce people to build their houses with such wretched materials, when the mountains can supply them with the best sort of stones; perhaps it is owing to their natural indolence, which seems to be the effect of the softness of the climate; yet the gates and doors are beautifully adorned with polished marble, and surely no other part of the world can shew such a compound of marble and mud, grandeur and meanness.

We generally find a square court beautified with marble fountains, variety of trees, and encompassed round with splendid apartments. The pannels and cielings are after the Turkish manner, richly painted and gilded; and they have generally artificial fountains springing up before them, in marble basins; and they are furnished to the height of luxury with parapets and cushions.

The church of St. John the Baptist is now converted into a mosque, and esteemed too sacred for Christians to enter; but we, for a small present, were permitted to look into it over the gates. These gates are large, covered with brass, and from top to bottom engraved with characters in the Arabic language.

On some parts of the church are the figures of chalices, and on the north side is an open square one hundred and fifty yards in length, and upwards of eighty in breadth. It is paved all over, being flanked on the south side by the church, and on the three other sides by a cloister supported by Corinthian pillars, well executed. Here the Turks pretend to have the head of John the Baptist; and one of the Turks gravely told us, that Christ is at the last day to descend from heaven into this mosque in the same manner, and at the same time, as Mahomet descends into Jerusalem. But this being no more than a

tradition, many of the Turks pay no sort of regard to it.

From the church we went westward about two furlongs; to visit the castle, a strong and rustic building, three hundred and forty paces in length, and near as much in breadth. We were only permitted to enter the gate; and thence we saw a stone with arms engraved upon it, being part of the spoils taken by the Armenians from the Christians. Among the artillery, we saw several antient Roman arms; but the Turks were so jealous, that they would not permit us to touch any thing.

At the east end of the castle there hangs down the wall a short chain cut in stone; a specimen perhaps; and no more; of the ingenuity of the artificer.

Leaving this place, we came to Bazars, which we found crowded with people; so that it was with much difficulty that we could lodge all night. However; we did procure a lodging; and next morning set out to see the procession of the Hadgees setting out to visit the tomb of Mahomet at Mecca, the Basha of Tripoly being their conductor.

This cavalcade was one of the most diverting we had ever seen, and had something in it picturesque of a religion in the middle way, between Christianity and paganism. Forty-six deeces, or religious madmen; marched in front, carrying each a silk streamer of red and green, or yellow and green. After them came three troops of segmen, an order of soldiers among the Turks; and behind them some troops of Spahis, followed by eight companies of Mugarbers; who are a body of foot designed to be left in a garrison maintained by the Turks sometimes in the deserts of Arabia, and relieved every year with fresh men. They had six pieces of cannon along with them, and behind them marched the foot soldiers of the garrison of Damascus, armed in the most fantastic manner that can be imagined. They were followed by two troops of janisaries, and their Aga, all cloathed in armour. Next came the Basha's two horses tails guarded by the Aga of the court, and then six led horses, finely harnessed, and pompously accoutered, having over each of their saddles targets of silver gilt, which made a most splendid appearance.

After these horses, we were entertained with a sight of the Mahmal, which is a large pavilion made of black silk, borne by a huge camel; and on every side the trappings hung down to the ground. All the fringes are gold; and the camel is adorned with foxes tails, beads, fish shells, moco stones, sea-weeds, and many other articles. Under this pavilion the alcoran is placed with great solemnity, together with a new rich carpet, which the Grand Signior sends every year to Mecca, for a covering for the tomb of the Holy Prophet; and in return the old one is brought, which is esteemed of inestimable value.

The beast who carries this sacred treasure, is exempted from bearing any burden ever after. Behind the Mahmal followed another troop, headed by the Basha; and the procession closed with 20 loaded camels.

This show being ended, we went to visit the Ager Danusenns, a long beautiful meadow, just without the city. On the west side it is equally intersected by that branch of the river Barrady which supplies the city; and is taken notice of in consequence of a prediction here, that Adam was made of the earth of this field.

Adjoining to it is a large hospital, within which is a pleasant square court, inclosed on the south by a stately mosque; and on its other sides by cloisters and other buildings of no contemptible size or structure. Returning homewards to our lodgings, we were shewn by the way an elegant bagnio, and near it a coffee-house, capable of containing four or five hundred people, shaded over with trees, and divided into two apartments, for the reception of Greeks; one being designed for the summer, and the other for the winter. That designed for the summer was a small island, washed by a small stream, and well shaded from the heat.

In the afternoon we went to visit the house of Ananias, mentioned Acts ix. 17. remarkable at present

sent for having a Christian altar and a Turkish oratory, both adjoining each other.

About two furlongs from the place where it is said St. Paul was converted, is a tall timber structure, and within it an altar, constructed on the spot where Paul rested after he had seen the vision.

Upon our return to the city we waited upon the Greek patriarch, a man seemingly a little turned of forty, of a cheerful aspect; but it did not appear from any part of his conversation, that he had much acquaintance with human learning.

April 30th we went to visit some gardens about a mile out of the city, where we spent the afternoon in an agreeable summer-house, over a clear stream of water. Here were many fruit-trees disposed in the most irregular manner.

In visiting these gardens, all the Franks are obliged either to walk barefooted, or ride upon asses; the insolence of the Turks being so great, that they will not permit a Christian to ride on horseback. On these occasions there are always hackney asses ready to let for hire; and when the traveller is mounted, the master of the beast follows, goading him behind with a sharp pointed stick, which makes him move the more expeditiously.

May 2d we set out for Sydonica, leaving on the right hand a steep hill, where, according to tradition, Cain murdered his brother Abel, and probably that crime was committed near this place.

Sydonica has nothing in it remarkable, only that it is celebrated on account of the goodness of its wine. It was founded by the emperor Justinian, on a steep rock, through which a road has been cut, otherwise it would have been utterly inaccessible. But, upon the whole, it is a poor mean place, only that here is a Greek convent inclosed with a stone wall. It contains about twenty monks, and about double that number of nuns, who seemed to live together in the most promiscuous manner, having no division between their apartments. On this rock there are no less than sixteen churches, all now in ruins; so that there is no place of worship besides the chapel of the convent, where, according to the tradition of the monks, the following miracle was wrought.

In former times there was here an image sacred to the Virgin Mary, where many miracles were daily performed; but, as ill luck would have it, one night a thief broke in, and stole it away. No sooner had the thief carried it home than it was transformed into a real body of flesh and blood, which affected him so much, that he carried it back to the convent, and acknowledged his guilt. The monks deposited it in a rich vase, under which is a silver basin, to receive some drops of holy oil that fall from it, reckoned an infallible remedy in all disorders of the eyes. This thief was a most arrant fool to carry the image home after its transmutation; for he might have sold it as a slave, seeing it had all the appearance of a handsome young woman.

On the east side of the rock there is an antient sepulchre, the entrance of which is ornamented with six statues. In visiting this sepulchre, one of our company happening to drop a little wine on the clothes of a janissary, the latter was so much enraged, that he fired a loaded pistol at him, which however did not take effect, but it taught us to be more on our guard for the future. The next morning we visited the house of Judas; and at our departure each man presented the convent with ten dollars, as a reward for the great kindness they had, on all occasions, shewn us.

From this place we continued our journey to mount Libanus, which we found covered with snow; and in labouring to get through it we had much fatigue. However, through the ignorance of our guide, we lost our road, and were obliged to return to Tripoli, where we were kindly received by Mr. Hastings, the English consul, who took us to see the castle. It is pleasantly situated on a hill commanding the city; but has neither arms nor ammunition in it, so that it is rather a prison than a garrison. Here we found

a poor Maronite Christian shut up, whose name was Shek Eunice, and who had formerly renounced his faith, and lived many years in the profession of the Mahometan religion. However, in his advanced age he returned again to Christianity, and the basha had ordered him to be impaled; which dreadful sentence was put in execution just at the time we left the place. In vain did the Christians from Europe intercede for him; in vain were bribes offered; for the basha was inexorable; and, indeed, had he not put him to death in this horrid, cruel manner, he would have been in danger of losing his own life.

The punishment of impaling is inflicted in the following manner: They take a post as thick as a man's leg, and about ten feet long, which they make sharp at one end, and this they force the criminal to carry to the place of execution; imitating herein the old Roman custom of compelling malefactors to bear the cross upon which they were to be crucified. Being arrived at the place of execution, they thrust the sharp end of the stake through the fundament, and then force the body down till the point comes out at the shoulders. After this they fix it in a hole in the ground; and sometimes the wretched criminal remains in torture above twelve hours before he expires. Sometimes, when the basha is a man of humanity, he orders one of the guards to stab him through the heart, to put an end to his misery.

May 9th we attempted a second time to visit the mount Libanus, and after a laborious journey arrived among the celebrated trees. These trees are frequently called the cedars of Lebanon; and are remarkable not only for their size, but likewise for the many allusions made to them in scripture.

Many of these trees are extremely large, for we measured one which was twelve yards in circumference, and its branches ninety-seven yards round. About six yards from the ground this tree was divided into five limbs, each equal to a large tree.

After surveying this place about an hour, the clouds began to thicken, and to fly along the ground, which so obscured the road; that our guide found it difficult to conduct us along. Thus bewildered, we rambled about upwards of seven hours; but at last, after a long exercise of pains and patience, we hit upon the way to Canobine, where we arrived late in the evening; and found such a kind and hospitable reception as made amends for all the fatigues we had suffered.

Canobine is a convent of Maronites, under an abbot, who at that time was Father Stephanus Edefiaris, a person of great learning and humanity. The convent, indeed, is a mean structure, but its situation is admirably adapted to retirement, to melancholy, and to monkish devotion. It is situated on the north side of a huge chasm, on the top of the mountain, and the chasm runs a considerable length.

It stands at the mouth of a great cave, having a few small rooms fronting outward that enjoy the light of the sun, but all the rest are in darkness. It was founded by the emperor Theodosius; and although it has been several times rebuilt, yet the patriarch assured us, that the church was of the primitive foundation: but whoever built it, there is nothing in it that can reflect much honour on the architect. At the side of the wall were two small bells, to call the monks to divine service; a privilege allowed nowhere else in Turkey, nor would it be suffered here, but that the Turks are out of the hearing of them.

The valley of Canobine was antiently very much resorted to for religious retirement; and here are still to be seen cells and hermitages without number. Indeed almost every part is covered with those ruins; but few of them are at present inhabited. Having viewed every thing worthy of notice in Palestine, commonly called the Holy Land; some of our company proposed going towards the wilderness, but finding that vast numbers of Arabs were in the fields, we desisted from that resolution, and returned safe to Aleppo, where we were joyfully received.

TRAVELS FROM THE LEVANT, TO SEVERAL PARTS OF THE EAST,
AND SYRIA.

By RUSSELL, DRUMMOND, AND OTHERS.

WE shall now, according to the plan laid down, proceed to relate what has been said of some parts of the east by travellers, still more modern than any we have yet mentioned; and having related every thing worthy of notice in their writings, we shall finish our account of Asia with Prior's, Chardin's, and Herbert's travels through Persia and Turkey.

To begin therefore with Mr. Drummond, a gentleman of undoubted veracity and good information, who had many opportunities of making himself well enough acquainted with these parts, having been several years consul from the king of Great Britain to Aleppo. He traversed from Germany to Venice, where he embarked, and landed in the celebrated island of Cyprus, of which he gives us the following account.

Cyprus has been looked upon by some geographers, formerly as a peninsula, joined to Syria, and lies between Alexandria and Antioch; but this will appear improbable to those who will consider, that the nearest headland of these places to each other are at a distance of ninety miles, and between them a vast depth of water. Cyprus is about seventy miles in length, eighteen broad, and in circumference about one hundred and sixty leagues.

The soil is a most excellent fertile clay, producing almost spontaneously whatever is sown, where there happens to be the least moisture; so that were the natives so industrious as to make proper use of the means, they might make this place resemble a terrestrial paradise. Here are no rivers, but the want of them are sufficiently supplied by springs, rivulets, and winter rains; and although the people were always remarkably lazy and effeminate, yet certain it is, that they sometimes cultivated the soil, so as even to be benefited by its produce; and to promote this, little labour is necessary.

Cyprus was for a considerable time divided into nine districts, governed by as many princes, who were subdued by the Egyptians, from whom it was taken in the time of one of the Ptolemys by the Romans, under the command of Marcus Cato.

Cato found no great difficulty in reducing this island; and having plundered the inhabitants, who were lost in effeminacy, he returned to Rome loaded with treasure.

When the Roman empire came to be divided, it became subject to the Greek emperors, who kept possession of it till the time of the Crusades, when it was subdued by Richard II. king of England, about the year 1190, and by him was disposed of to Guy de Lusingham, when the latter was dispossessed of Jerusalem. It passed afterwards through the hands of variety of masters, and was for some time subject to the republic of Venice.

About the latter end of the sixteenth century, the Turks made themselves masters of it, meeting with but little resistance, except from the inhabitants of the town of Famagusta, which did not surrender till the year following, 1571.

On this occasion, the Turks gave loose to their barbarity in such a manner, as was disgraceful to human nature. Twenty thousand men, women, and children were cut to pieces in the town of Nivofia

after the taking of that town; and such of the women as did not appear agreeable to the Turks, were like so many victims led to a funeral pile, where they were burnt alive in the market-place.

Twenty-five thousand of the women, young and healthy, part of the inhabitants, were sold into slavery, and two very large vessels were laden with the spoils of the place. The principal nobility, with the most beautiful females, were to be taken to the grand seraglio; but one of the unhappy victims having privately provided a lighted match, went down to the powder room, and blew up the ship; and all on board perished, whether Mahometans or Christians.

Never was a place more gallantly defended than Famagusta, for the Greeks were reduced to the last extremity before they surrendered, and left not even a mouse living within their walls. But at length wearied out with fatigue, and reduced to death's door by famine, they capitulated, upon condition the inhabitants should not be plundered, that they should be allowed the free exercise of their religion, and the garrison to be transported with military honours to Crete.

Every thing was now prepared for their departure, when Bregandino, who had been governor of the place, waited on Mustapha, the Turkish commander, attended by a noble train of officers. At first they were treated with respectful ceremony, but being about to take their leaves, Mustapha, under pretence that he missed some Turkish prisoners, whom he accused them of having murdered, caused them to be suddenly surrounded, and cut in pieces; Bregandino only being reserved to undergo more cruel tortures. He was impaled, and bore the torture with such patience as amazed the wretch who inflicted it upon him. He was skinned after his death, and the skin was stuffed and sent to the Grand Signor at Constantinople. Such horrid actions as these are a disgrace even to barbarous governments. Princes, or their deputies, may trample on the rights of humanity; but in general, while they transmit their names as illustrious persons to posterity, they are marked with such a brand of infamy, as time itself cannot wear off.

At present the island of Cyprus is but poorly cultivated; for the natives manure no more of the land than they find necessary for their own subsistence. Indeed it is almost the same in all places under the Turkish dominions: slaves to arbitrary masters, or rather tyrants, their minds are depressed, and they are, as it were, rendered feeble and inactive; well knowing, that should they be at ever so much trouble to cultivate their ground, they would not enjoy the fruits of their labour.

If it should happen that any of the people heap up wealth, they are obliged to conceal it in the most secret manner possible; for as soon as the bashas know that they have any money; they seize upon every thing belonging to them; and were they to complain, they would be punished in the severest manner.

Almost all the Turks who have acquired riches bury them under-ground, and never so much as mention them to their nearest relations, till such times as they are at the point of death; and then, by an act of prudence,

Engraved for Messrs. Smith's Complete Collection of Voyages & Travels.

View of BAALBEK in SYRIA; including the magnificent RUINS of the Temple dedicated to the Sun, on the east side of the Town.

dence, it frequently happens, that the fruits of honest industry are conveyed from one generation to another. Mr. Vallaino tells us, that there is no arbitrary power in Turkey; but this superficial writer never went into the spirit of any thing; he knew nothing of the laws of nature and nations; and, as the late great and good Lord Lyttelton justly observed, he had a head turned for romance; he was a stranger, to the truth; he asserted things as such, without knowing their import; and ran over the history of Europe, of natural, civil, and municipal law, in such a manner as would procure a school-boy a severe chastisement.

Niconia is the capital of the Isle of Cyprus, and pleasantly situated. It stands about the middle of the island; and in our journey to it we were obliged to ride upon mules, with ragged saddles, and a goad pointed with iron instead of a whip, otherwise the beast would not have moved at all; and the journey was exceedingly troublesome, though not above twenty-four miles in length.

When we arrived at the gates of the town, we were obliged to alight, and walk over the bridge, for the Turks will not permit a Christian to ride into their towns or cities. In viewing the fortifications, we found that they had been formerly strong enough, consistent with the nature of war, in the middle; but when we were there, there were not above six guns mounted upon the walls; and indeed the whole seemed to be falling into a state of confusion.

It was here we found that in 1735 an earthquake had done the town considerable damage, and threw down a mosque, which had been formerly a Christian church, dedicated to St. Sophia, burying in its ruins above two hundred Turks, who were there at work. In the neighbourhood of this place are fine quarries of marble; and yet the people are so indolent, that they will not dig it up, but build their houses of a light spongy stone, which soon moulders away.

In viewing the governor's palace, we could not discover any thing that conveyed to our minds either elegance of taste, or justice in expression. A sort of rusticity distinguished the whole, which marks it to have been the work of barbarous ages. The arms of the State of Venice are still to be seen over the gate, with an inscription in Latin, which the Turks would certainly have erased, had they not been ignorant of its meaning. A little before the front of the gate, and altogether disjunctive from it, are two pillars of granite, with bars of white marble; and betwixt there is a tomb erected for some illustrious person, but history has not been so faithful as to transmit his name down to the present age.

There are several other curiosities near this place, which deserve a particular description: The bay is very good for shipping; but there is nothing worth seeing at Larnica, which is pleasantly situated about a mile distant from this place. The houses are built of mud, shaped like brick, and dried in the sun; and they are never higher than one story, because of the earthquakes, which are so frequent in this country.

At Larnica there are three mean churches belonging to the Greeks; a Franciscan convent, and another for Capuchins, together with the French factory, where we were treated with all the politeness imaginable by the consuls from the different nations in Europe.

About a mile distant from Larnica, is the port of Salines; so called from a cluster of lakes in the neighbourhood, where the Venetians were antiently accustomed to make great quantities of salt, which brought them in large sums of money; amounting, according to a moderate computation, to one thousand two hundred and fifty pounds sterling of our money. However, it is now fallen off, and at present is farmed for two hundred pounds a year. This difference in the profit must be ascribed intirely to the indolence of the people, the instability of private property, and the conduct of the bashas, who divide their time between indolence and overbearing extortions.

While the Venetians were in possession of this place, these lakes were carefully preserved by a wall of stone

and mud, the remains of which are still visible; whereas at present the salt, while in cakes, may even when fully chrystallized, is open to the tread of man and beast; and being by that means mixed with clay and dirt, the value of it naturally decreases. We endeavoured to make ourselves acquainted with the nature of these minerals, which made such abundance of salt, and on the closest inspection learned that they were of the same nature in many respects as our mineral springs in Cheshire.

A little distant from this place is a mosque, called Tokee, where the Turks say the grandmother of Mahomet, is interred; and at her grave they frequently offer up prayers; but how this good old lady should be brought from Arabia to Cyprus, is not easily to be accounted for, unless we suppose that it was conducted with the same facility as the house of the blessed Virgin was brought first from Asia to Dalmatia, and from thence to Loretto in Italy, in the province of Ancona.

At Salines there is a church belonging to the Greek Christians, dedicated to that Lazarus whom our Saviour raised from the grave, and who they say was buried here; but all this is no more than conjecture. It appeared to us to be an antient heathen monument; for the architecture had something in it no ways consistent with the nature of our orders.

In Cyprus the locusts are very prejudicial to the grain; and the Moors are obliged to wear bells fastened to their boots to frighten away the ants, the tarantula's, and other venomous creatures, with which the island abounds. The bite of an ant is said to kill in less than an hour, unless the part affected is cut off. One day we saw a serpent in the fields, above two yards long, of a blackish colour, with something like a natural coronet on his head; which he carried above half a yard above his body.

We spent many hours in the fields, in order to discover whether there were any remarkably curious trees to be met with in the island; but notwithstanding the situation of the place, and our unwearied assiduity, we could find none of an extraordinary nature.

The Grecian women, who differ little or nothing from those of Cyprus and the Archipelago, dress in a manner that is wantonly superb, though perhaps not so agreeable as those of Europe. The ornaments of their heads are, however, graceful and noble; and although they are not so beautiful as some of our travellers have represented, yet they are naturally inclined to love; but avarice is their ruling, destructive passion; and they pay so little regard to chastity, that money will, at any time, triumph over their virtue.

But what is most remarkable, here are so many men so indifferent about the chastity of their wives, that they will marry her who has the wealthiest galant, rather than the woman who has much virtue and little money. Yet this island is not without even a contrary extreme; for there are husbands so jealous of their wives, that they will not suffer them to go any where out of their sight but to church, where the fate of many abused husband is finally determined.

No body is ignorant of that jealous care with which the women all over Turkey are kept; nor are their tongues permitted to speak the dictates of their hearts. This practice is not consistent with the religion of nature, nor with the nature of things; but yet for all that, it seems to have taken place in the antient times in the east, and was again renewed by the Turks; after the Grecian solidity had put it out of countenance above eight hundred years.

The grand vizir lets the government of Cyprus for forty thousand pounds annually; and the governor remains in office only one year; so that we may naturally imagine the people are fleeced to a great degree.

In 1744, the governor of this island, what by extortion, and other illegal practices, cleared the enormous sum of thirty-one thousand pounds in money;

besides an amazing number of presents, with all his expences paid. This is horrid; but it is true. To what purpose are the people thus miserably harrassed by a man, who in six months after his return to Constantinople, may fall the victim of an unjust accusation, set on foot against him by an avaricious and designing master, who, by procuring his destruction, enjoys for some time his ill-gotten riches; till he himself falls under the displeasure of his sovereign, and partakes in the general ruin?

Bribery and corruption here have reached to such a height, that nothing is to be done without a present. Happy for us if this scandalous practice were confined to Turkey; but we find it dispersing its balefulness over Europe; being encouraged in Great Britain, the land of nominal liberty; and probably it will accomplish our final ruin.

In Cyprus, the most odious crimes may be pardoned on condition of the criminal giving a small sum of money to the judge. It is certain this practice was once universal, and it continued in full force in England till the reign of Henry I. when some regulations took place about the year 1114.

Every man in Cyprus is subjected to a certain impost, which he must have ready when the collector arrives; and if through any misfortune he should happen not to be able to make good his payment, then all his goods are sold, his wife and children turned out of doors, and himself, although ruined in his temporal circumstances, yet is liable to undergo a corporal punishment. Here arbitrary power reigns in all its horrors; and to be hated, it requires only to be seen, experienced, and understood.

There is one archbishop in this place, who, under pretence of some special assessments for the service of the church, raises large contributions on the people, with permission from the governor, who has a share in the plunder. This was the case in the year 1743, when the archbishop levied a vast sum from the people in the most cruel and barbarous manner; and although this prelate was deprived of his dignity, and stripped of all his ill-gotten riches, yet the rapacious basha kept the emoluments for himself; so that the poor sufferers never received any thing.

Under the archbishop are three bishops, and although each of these has considerable salaries, yet they rove about from place to place rather as beggars; for where-ever they go, they make the poor afflicted people defray their expences. Every priest at his ordination presents the bishop with a small sum of money, which the common people are obliged to make good. All the priests are extremely ignorant, many of them not being able to read their own rituals, nor indeed any book whatever.

We need not wonder they should be despised by the Turks, who look upon them with contempt; and most of our European travellers attempt in vain to learn any thing satisfactory from them.

Wretched however, as these priests are, and shocking to think that they should be destitute of humanity, to the poor persons whose dependence in spiritual things is upon them; yet they pretend to such austerities as are apt to attract the notice of the vulgar. They fast three times every week; they go bare-footed; lay in sackcloth; and on these accounts they are considered as something more than human.

The trade of this island is very considerable; and the exports, in a general way, consists of silk, wool, madder, amber, carrobean, and several sorts of wine, the profit of their vintage amounting to at least twenty-five thousand pounds a year; all which is sold to the Venetians, and a duty of three per cent. is charged upon the merchant.

As for the imports, they are but few, consisting chiefly of some French and Venetian cloaths, and sometimes a few bales of British manufactures, cutlery-ware, watches, toys, paper, tin, lead, sugar, and many other articles; but these we exchanged for the natural produce of the island, because the rest of the inhabitants are so poor on account of the rigour

of the Turkish governor, that they have no money to spare to any foreign merchants whatever.

There are three sorts of vermilion found in this island, and in some parts the Asbestos, so famous in our northern regions. But what we were most curious to inquire into here, was the effects of the bite of the Tarantula. But we could not find that any person had ever experienced it, although we found all the inhabitants of the island firmly persuaded that it was of a very poisonous nature. We tried several experiments upon this reptile, but could not perceive any moisture issue from its bite: we put two of them into spirits; but they instantly sunk to the bottom of the vessel, and soon after spued out a sort of black corrupted matter, with several globular pustules, shining as quicksilver, issued from every part of them; we no sooner infused one into the liquor, than it turned into a caterpillar of the most beautiful hue found here; and the colour of the insect, from the head to the middle of the back, was immediately changed.

From all the observations here made, we found that the bite of a viper operates in the same manner; so that we ought to be very cautious in paying much regard to what the elder Pliny has asserted in his natural history.

The body and legs of the Tarantula are black; covered with long bristly hair. The belly is shaped like an olive; and it has two tails, with eight legs, and the same number of eyes. It is well known that the ancients believed the bite of this reptile could be cured by music; but this is a vulgar error, like many of those romantic stories which are greedily swallowed by the vulgar, who seldom trouble themselves about inquiries. But, let music be ever so efficacious in the curing the bite of this creature, certain it is, that the inhabitants of Cyprus are intirely unacquainted with that musical art, only they are expert enough in skipping and dancing like madmen.

Mount Croce, a very high hill, is situated about sixteen miles from Larnica, and serves as a landmark for seamen. On the summit of it is a church belonging to the Greeks, and dedicated to the Holy Cross. It was built by the emperor St. Helena, and the priests shewed us a piece of wood, which they said belonged to the real cross; but we had seen so much of these pretended relics, that we paid no regard to this.

The church is a mean building, and patched up in different places; and near it is a convent and a chapel. From motives of curiosity we went one day to visit the prior of the convent, who invited us to dine with him; and, upon the whole, he was what we in this country call a jolly companion. He acted in the triple capacity of priest, ostler, and inn-keeper; for in general, the Greeks are so much oppressed by the Turks, that they are willing to do any thing to procure a subsistence.

There is no water to be found near this convent, except what is drawn from pits, which is very disagreeable and brackish.

The air is so impregnated with salt, that a man who has been in a heat, may, when cooled, rub a thin crust of it from off his face. There is nothing into which the particles of this mineral does not insinuate itself, nor are its disagreeable effects to be corrected by sugar.

While we resided at Larnica, which was only a few weeks, there was a new governor arrived from the Grand Signor; and we were permitted to wait on him, being introduced by Mr. Wakeman, the British consul.

These haughty governors think it no small favour shewn to a Christian, when they admit them into their presence. But this governor had something in him far superior to the common rank of that order. He did not only receive us with civility, but even consistent with that goodness of heart which is natural, and cannot be learned; he rose up from his couch, as if we had been his superiors.

The

The next place that deserves a particular description, is Nivosia, pleasantly situated in a plain, between Olympus and a range of mountains that run from the south-west to the north-east of the island. It was formerly well fortified by the Venetians; who kept a garrison here, but at present the walls are decayed, and the ditch that surrounded it is almost filled up. It is about three miles in circumference, and has many ruined palaces, having been once the seat of the Venetian governor, and all the nobility who attended him. However, there are but few inhabitants in it, but the gardens are the most delightful that can be imagined.

The Church of St. Sophia is an old Gothic structure, and the only one of any note that remains intire, but the Turks have converted it into a mosque, and destroyed all its ornaments, for these people will not suffer any images to be, either in their houses or places of worship.

At a small distance off we saw an inscription, but we were not permitted to read it, and this surprised us much, because the Turks, in all conversations we had with them, always spoke in the most respectful manner of the Old and New Testament. But at present they call Christians, dogs. The reason is plain; Christianity is a divine religion, but its professors despise its precepts.

The situation of this town was in all respects improper to be made a fortified place; for, being almost surrounded with hills, it could at any time be laid in ruins by an enemy. There is a pleasant road from Nivosia to Lemosol, where there is a good bay for shipping, and some trade, though not of any great importance. There is likewise a castle here, built originally by the Venetians, but at present there are no guns on it, and the walls are falling to decay.

About six miles from hence stood the Amanthus of the antients, famous for the amours of Venus and Adonis.

Here was once a strong castle, built by one of the Greek emperors, and the walls of it are very stout. The port has formerly been tolerable, and from thence to within ten miles of Larnica, the country is very agreeable; but all about this spot, the salt air, for want of moisture, and the neglect of cultivation, render it very unwholesome. The ground is so tender, that it is easily cultivated, for one man ploughs with two oxen, as lean as those of Pharaoh's kine. Instead of a harrow, a man presses down the earth standing on a thick plank, drawn like the plough by two oxen.

When a large field is ploughed, they fix three or four planks together, and a great lusty fellow is placed upon them to press them down upon the grain, which practice is far inferior in utility to that of our harrows. In the same manner, they yoke one ox, and fix a load of planks to him, which he draws over the corn in barns; and this is what they use instead of threshing. It is in allusion to this practice that the Mosaic law ordained, that the ox who trod out the corn should not be muzzled.

While we were in this island, we had many opportunities of making ourselves acquainted with that remarkable creature the cameleon, of whom we have so many romantic stories in antient authors. We purchased several of these creatures, and one of them died while we were in the island.

The length of this cameleon is generally under ten inches; its eyes are large, and the head is proportionate to the size of the body. When provoked, it lets down a large bag from its lower jaw, swells pretty much, gapes wide, and hisses like a serpent; and when frightened, it shrinks surprisingly. Mr. Drummond observes, that he kept one of these creatures in his study, and he frequently observed it to turn of a steel colour when he laid his snuffers beside it. In the same manner it adapted a yellow colour from his candlestick, and a lime colour from the wall; but the most remarkable thing was, that

the borrowed colour often affected that side of the cameleon which was the farthest from the communicating object, while the nearest side retained the natural tincture of the skin, which is either black, brown, yellow, or beautifully spotted. It is extremely timorous, and, with its long curling tail, winds itself about any thing so forcibly, that it requires not a little strength to separate it.

This animal dwells in holes, ranges among trees for its food, and has no ears; so that it is not at all affected by any sound whatever. Neither are its nostrils perceptible without glasses; its mouth is extremely wide, its teeth short and sharp; its tongue, which lies folded in the hollow of its mouth, small and long, and it darts with great dexterity at small insects; as they pass by it. But we shall now go on with a further account of the different places in this celebrated island.

On the banks of the river Tatus lies the village of Chilly, and near it is a good stone bridge, very well constructed, having been built by one of the Greek emperors. There are no places here for barges to anchor at; so that it is not at all commodious.

In 1747, Bekier, who was at that time basha of the island, being a man of great public spirit, put himself to a vast expence in making works and aqueducts to introduce the waters of Aspera and Larnica, the distance being about six miles; but this noble design was laid aside upon his removal; and although he left several sums of money to carry on the works, yet they were shamefully neglected till the year 1750, when they were completed under another public-spirited basha, who was a relation of the former.

The village of Chilly is beautified with a vast number of silk gardens, and the road from thence to Maroni is very pleasant, being bounded on one side by hills, and on the other by the sea. It is adorned with a variety of olive and laurel trees, and Maroni itself is delightfully situated upon a rising ground, having a beautiful and extensive plain. Here are many rivulets and brooks in the rainy seasons, of which no marks appear in the summer; and there are several channels of rivers to be met with, which are not mentioned by antient geographers. But we looked in vain for some remains of the famous temple of Venus and Adonis; but it appears to have been demolished by one of the Greek emperors, or perhaps by Richard I. king of England. In the seventh century we find that one John, patriarch of Egypt, resided here, being his native place, and it was here that he breathed his last. The priests told us, that when this corpse was carried to be interred, a good bishop, who had been buried here above one hundred years, rose from his grave to make a present of it to the Patriarch, who is still called St. John.

The next place we visited was Limesol, antiently called Curium. It was once in possession of the Knights Hospitallers, when they were driven out of Palestine; but it is now subject to the Turks. It has a full open bay, of which some travellers have given a very erroneous account. Near it stands the village of Agrodiri, upon a neck of land, and which formerly was given to the priests of St. Basil, upon condition that they would keep a certain number of cats to destroy the serpents which infested the neighbouring grounds in great numbers.

The country from hence to Colos is open and pleasant, the village is fine, and here are still to be seen the ruins of an old castle. Crossing a fine river, we arrived at Piscopi, a large beautiful village, round which there are some grand ruins, and the adjacent grounds are watered by an aqueduct from the river. Here was formerly a temple sacred to Apollo, of which some remains are still to be seen. The tradition concerning it is, that it was built by one who taught musick, and there is still to be seen a figure upon it, not only corroborating what is here advanced, but even a proof of it.

The next place we visited was Livathi, a poor contemptible place, and after travelling over a rugged country, we came to the famous Paphos of the antients. Here are many traditions concerning the foundation of this place, but they are all attended with so much wild

uncertainties, that no trust can be put in them. Here once stood an altar sacred to Venus, built on the very spot she first set her foot on when she was cast on shore. It was once a famous sanctuary, and noted for divination, the priests being always of the blood royal of the island. This altar was never stained with blood; the offering being of pure fire, and though presented in the open air, and at all seasons, no rain ever extinguished, or was known to approach it. But this nominal miracle may be easily accounted for, by remembering that the clouds may be seen pregnant with moisture some little time before they burst, which they do in a sort of deluge, and then all is over; so that consequently all the bad effects may be easily avoided. However, we found here but few remains of antiquity; notwithstanding we spared no pains whatever to search for them: but this must be owing to the devastations made by the Turks.

There were formerly a great number of churches in this place, but few remains of them are now left; and as for the common buildings, are all modern. Here are several curious and even stupendous ruins to be seen near the port, which undoubtedly belonged in antient times to the Temple of Venus, so much celebrated by the heathens; she seems to have been a most beautiful woman, who, by some accident or other, was cast ashore on this island. Whatever had been her former character with respect to chastity, or indeed any of those virtues which should at all times adorn the female sex, there can remain no manner of doubt but she was a common prostitute afterwards; and her age being that of unrestrained, unguarded pleasure, or rather inordinate lust, those who were sunk into all sorts of sensuality made her a goddess after her death. Probably they did so, one evening, at their debauched entertainments; as Lord Chesterfield says, the heathens made a god of Bacchus, at a time when they were in a state of intoxication.

We have some account of this place in the history of the Acts of the Apostles, where we read that Elymas the forcerer was struck blind; and the proconsul Sergius converted to Christianity by the ministry of St. Paul. The whole country round this place abounds with different sorts of stones, but none of them have any thing curious in them.

From this place we travelled northward over many hills and precipices, which we found to be extremely dangerous. But what was still more pleasing than any thing we had hitherto seen in our journey, was to view the industry of the inhabitants, who even in those barren parts of the island cultivated the ground in such a manner, that they enjoy both the comforts and necessaries of life. In our progress through this place, we had a view of Accamas, where flows the celebrated spring called the Fountain of Love; but notwithstanding all the boasted stories relating to it, yet we found the waters very disagreeable, and therefore in order to avoid getting great with love, we only tasted them.

Stroumbi, where we resided a few days, is a pleasant, agreeable village; but the inhabitants seemed so much surpris'd at our dress, that they flocked around us as if we had not been human beings. We stood some time to gratify their curiosity; and to please them we gave some money to their children, who fondly hung by the skirts of our cloaths.

All along the coast of this island are vast numbers of creeks, which would be a fine refuge for small craft, and of great service to the inhabitants, were they governed with justice, and secure in the enjoyment of their property. But, alas! they are strangers to this happiness; and, as an addition to their misery, at the time we were there, the land was quite parched up with drought, and covered with locusts, who destroyed what was left of the fruits of the earth. In one night they destroyed a field of corn, the produce of which would have subsisted fifty men for above a week; besides supplying cattle with fodder.

In our progress from this village we fell in with a deep gut upon the rocky side of the river Simbula, between two impending hills, from each of which the trees and rocks projecting presented a sort of horizontal

covering, so delightful, that we spent a whole day in contemplating its beauties. We had along with us a janifary, with several servants, an interpreter, and a guide; and we made it our study to indulge them in every little amusement as much as possibly we could.

In leaving this delightful spot (says Mr. Drummond) my mule, with myself on her back, fell over a precipice, and had we not been received on the upper part of a projecting rock, we must have been dashed in pieces; however, neither the mule nor myself received any hurt worth the mentioning, which I considered as a mark of the Divine Providence. On our return, we dined in a delightful grove of tall spreading trees near the river Pierga, hard by which is a perpendicular pillar erected by a certain queen whose palace was formerly in the neighbourhood of this mountain. All their castles and palaces seemed as if founded by ladies; but the great misfortune is, we have no records concerning them. We can neither tell who nor what they were; such havock has time made in antient records.

Proceeding on our journey, we lay that night at Lepa, a small town finely situated upon a winding river, with a vast variety of gardens. The next day we crossed the river Cunara several times; but not without meeting with many frightful precipices that filled us with horror, while at the same time they diversified the scene, and heightened the grandeur of every object. The same day we came to the river Gambo, which we crossed, and here it was that we met, for the first time, with a vineyard in this island. Besides the vineyard there were several groves, where the smell of the aromatic herbs was so delightful, that we left it with reluctance.

In a short time after we arrived at the famous Madonna di Chekka, where we were received with great courtesy by the papa; who, in point of dignity, is little inferior to a bishop. The convent is finely ornamented; but the architect has forgot to make an entering into the church from the west, which surpris'd us much, because we had never met with any thing like it before, either among the Roman-catholics or the Greeks: for almost all the churches are constructed in such a manner, that a person going in from the west bows to the altar.

In one apartment of the convent is a wretched piece of painting, representing a man on a cross, having on his left hand the figure of a man on horseback, in full speed, holding a cup of wine in steady poise, surrounded with palaces, groves, cascades, &c. and on the other hand is a strange representation of hell, with monsters among the flames, devouring the wicked, while our Saviour, in the clouds, points to the martyr, and offers him a crown of glory. Under this picture are some Greek verses, which the reverend Mr. Crofts, one of our company, translated to the following import:

“Behold here fairly pictured the life of a true monk; how absolutely he is crucified to the flesh, and to the world. The cross especially typifies mortification. The lamps truly represent the splendor of the virtues. The shutting of the eyes, that he is not to regard at all the vain and unstable objects of this false world. The silence of the mouth, that he should not speak unseasonably the contumelious and filthy language of the present age. The nails in the feet, that he must not at all walk in the broad path, nor indulge in intemperate delicacies; but with charity, silence, and purity of life, shine visibly to the world, beyond the sun's curtain; and wage perpetual war with the deceitful world, the lusts of the flesh, and the malicious devil. For the Lord of the universe is near him with his angels for his assistance, and holds in his hands a crown and a diadem, that if he prove victorious over the lusts of the world, he may, according to his merits, crown his brow, and admit him into the kingdom of heaven.”

We were much surpris'd to find, that a convent which made so mean an appearance, should have considerable endowments to support it; but such is the severity of the Turkish government, that the poor monks

are obliged to conceal their riches, lest they should be torn from them by lawless arbitrary power. The valley of Sallia is the first in the whole island. There are many pleasant villages scattered about through every part of it, and the adjacent hills are covered with woods and verdure.

It may not be improper to observe, that Solon the great Athenian lawgiver resided some time in this island; and here it was that he studied the whole system of jurisprudence, upon which his most excellent laws were founded.

The equitable laws he there instituted, joining to the richness of the soil and pleasantness of the place, drew to it people from all quarters, which was attended with this inconvenience, that their language became corrupt even to a proverb; and it is from this that the word *solecism* is derived.

About a league and a half from the sea is Morfou, a very pleasant place, and the church is the most handsome building in the island. This is in the Italian taste, and was dedicated to St. Mamas, who, while he lived, would never pay the tax money. This extraordinary circumstance coming to the ears of the prince, he ordered that the saint should be forced from his solitary retreat, and brought into his presence. St. George and St. Demetrius hearing of his captivity, followed, and overtook him on the road, resolving to share in his good or evil fortune. In their way they happened to see a lion rush from a neighbouring thicket, and seize upon a lamb, to the terror and amazement of the guards. But St. Mamas beholding the whole with great indifference, ordered the shaggy tenant of the forest to let go the innocent lamb, his prey; in which he was obeyed, and the lion wagged his tail and fawned upon him, in token of submission. By this time the good man being tired with walking, took the lamb in his arms, and mounting the lion, rode on him to court, to the terror and amazement of all the beholders.

The prince, being apprised of the affair, received him very respectfully, ordered, that ever after he should be exempted from paying taxes, and accepted of the present of the lamb.

This story is told differently by almost every priest, but the most remarkable circumstance is, they never told us what became of the good-natured lion.

About six miles from Morfou we found the people very industrious, for they collect the waters as they fall from above into reservoirs, from whence they are easily distributed over the lands. In riding over the Lapitho, we passed by a hill situated in the most delightful manner, whereon had formerly stood some fine majestic trees, the roots of which being now decayed, young branches sprung up from them, and formed a pleasing canopy.

Lapitho was formerly called Amabilis, and that very justly; for although it has no river, the grounds of the slope from the mountains are fertile and pleasant, bearing great variety of trees, and fine crops of grain. Here we saw many ruins; but the houses of the inhabitants are poor mean structures.

The next place we visited was the village of Elia, where there are several Cyprus trees; and the ruins of some arches, with curious figures carved on them.

From thence we proceeded to St. Hilarion, but now called Agios Largos, situated on the summit of a hill, so very steep, that no beast can mount it to the westward. Wherefore, leaving our baggage at Carmi, we turned off with our mules to the eastward, where we found an easier access. According to what remains of this town, it must have been very strong; but there was not an inscription to be seen to inform us by whom it was built.

After travelling about two hours longer, we came to the port of Cerisia, heartily tired with our journey over the mountains. The prospect from this place over a wide extended plain, is the most delightful that can be imagined, and there are still to be seen here the remains of walls, towers, and bastions. It is

amazing to think what quantities of stones and broken pillars are dug up here; from whence we may naturally infer, that it was formerly a place of great repute.

Here we visited De la Pays, once a very elegant structure, and said to have been formerly a monastery or dwelling for the Knights Hospitallers; but it is now in ruins.

The order of the Knights Hospitallers was instituted in 1099, and the brethren of it made an oath of poverty, which was; to subsist on charity, and deny themselves every thing except what was absolutely necessary to supply them with arms; ammunition, and a subsistence. Yet such was their duplicity, that when they were expelled from the Holy Land, they were enabled, either by the folly or munificence of the Christians; to build sumptuous palaces, and support princes one against another; and those Knights, although they vowed poverty, charity, and temperance, yet they had near twenty thousand lordships left them by deluded Christians. Being possessed of such wealth, they enjoyed every delicacy that could be procured, wallowed in unnatural lusts, and even dictated to their sovereign; in a word, they lived inconsistent with every thing that merited the name of virtue.

At a place called Agios Phanentis, we found human bones much petrified. The country people have a tradition, that a vast number of foreigners, called Allani, from a savage country, came to invade this island, and were here shipwrecked, their bones being turned into stone, as a monument of Divine justice. Some few indeed they say escaped, and, being converted to the Christian faith, lived happily in the island, among which number was the famous St. Mamas.

We shall find some foundation for this story, if we reflect, that when the Goths invaded Greece, they visited some other islands; and although not mentioned in history, yet it is not improbable but that they might invade Cyprus. This conjecture seems more probable, from the natives being acquainted with the word Allani, from which *Alemagne* or *Germany* is derived.

But notwithstanding all this, these petrified bones are certainly not those of the invaders, it being much more probable that they belong to persons many years ago, who were shipwrecked on this part of the island, whose bodies being washed ashore, the bones became of course petrified.

There is a convent here dedicated to St. Chrysostom, a large but at the same time a very clumsy indifferent building; it is true, some parts of it are of good marble, well wrought, and here is also a great deal of gilding, but nothing regular.

The superior of the convent told us, that it was built by a princess of old, but he did not mention her name. It is situated near where there was formerly a temple dedicated to Venus; and here is a *seraglio* for the women belonging to the Cadi or Judge, wholly composed of the ruins of antient temples, which induced us to wish that the stones might fall and crush him to pieces in the arms of his favourite concubine, but we wished the poor girls to escape.

The antient Citrea is one continued chain of gardens and summer-houses, watered with living streams, conveniently dispersed by means of channels; and here nature appeared in the greatest bloom, and was crowned with the most delightful verdure. A little further we visited Ganatanappa, where there is a convent, with a pleasant garden, and a fountain of clear water; and a cupola, under which the people sit to solace themselves. Here is a pretty agreeable harbour, where the poor people employ themselves in fishing with boats of a very particular structure, consisting of a few sticks bound together, with some very small ones laid in the hollow, where the fisherman sits managing his tackle, and steering his machine with a paddle.

From hence we returned through fertile, but neglected

glected lands, to Larnica, which seems to have been formerly the seat of regal dignity, before it was taken by Ptolemy Sotor.

From this part of the island we travelled northward over the mountains; and afterwards passed from Malandrina, to the bar of Limeone, where vessels from the east come to an anchor; and it would be a place of safety, were it kept in proper order. A few miles further we came to a place called Sancta Maria, where there are many ruins; and as these are antient, probably they have formerly belonged to a heathen temple that stood here. All around this place the soil is good; but such is the indolence of the people, that for want of cultivation, it is over-run with weeds. The village of Agatha is extremely pleasant, lying on the skirts of the mountains, but has no buildings that merit a particular description.

From hence we ascended a steep hill to view the buildings and fortifications of the castle of Cautara; but although the people told us that this was a place of strength, yet when we came to inspect into the works, we found them untenable, and not proper to resist any enemy whatever.

This part of the island is so diversified with rising grounds, valleys, woods, brooks, and rivers, that nothing in the world can be more delightful. Passing from thence by several antient ruins, whose names are not preserved in history, we arrived at the modern Cyprus, once famed for its beauties, but now a mean village. Here the Greeks have a church, built without taste, but the wooden work within being curious, shews that it has been taken from some antient fabric; probably a heathen temple.

About two miles more to the eastward, are the ruins of a village, where there seems to have been formerly a town, but its name is swallowed up in the ruins of time. Here the place is extremely narrow, but the prospects are delightful. We ascended Mount Olympus, so much celebrated in history; and where there was a temple, dedicated to Venus, but no remains of it are now left, there being a small Greek church built on the spot where it stood. Here we found the air so cold and moist, that it affected every thing we had in our pockets.

Travelling from hence we passed through several fields, meadows, and woods, and over mountains, but few of them were cultivated; and at last came to the convent of Canatcarga, which is built upon the model of the antient Greek churches, and seems to have been erected about the sixth century. Near to this convent is the village of Rosala, surrounded with corn fields, flourishing gardens, pleasant views, beautiful tufts of trees, and a natural scene of little hills. About a mile farther is Komatoulagou, prettily situated; and near the sea the fields are well laid out. It was formerly extensive, adorned with fourteen churches, but most of them are now in ruins. None of these ruins exhibited any thing remarkable, which may serve to shew that even the most antient of them were built when the knowledge of architecture was not much regarded.

Travelling through a number of delightful spots, we came to Famagurta and Castro, where there are still cisterns, with the remains of the town and fort, on a little hill, with a Roman causeway adjoining.

Here we walked out in the morning to visit the adjacent country, and had the misfortune to lose our way, not having taken along with us a proper guide. But this was not all; we had other difficulties to struggle with.

The silly, ignorant country people seeing us taking down notes and drawings, foolishly imagined that we were sent by some people who intended to invade the country; and their notions were circulated with incredible rapidity. Like snow-balls they gathered strength as they moved along; so that they produced such a clamour at Cerinea, that the Cadi sent a message, demanding to know our business, and where we were going? We answered, that we were about no

other sort of business than merely to satisfy our curiosity; but the cadi was not content with this, for he sent notice to the governor, that he believed we were spies, employed by the Venetians to take drawings of the harbours, towns, and castles. Upon this we were taken into custody; but we gave such a satisfactory account of ourselves, that we were dismissed; and the cadi was reprimanded.

However, as we still found ourselves liable to fresh insults, we resolved to leave this place, and visit Syria.

When we arrived at Aleppo, we went with our worthy friend Dr. Russel, of whose assistance we were then much in want; for we had, while we indulged our curiosity, contracted several disorders; but his skill restored us to health, and enabled us to pursue our journey. We travelled over the same tract as Mr. Maundrell had done before; so that we shall only take notice of such things as did not come under his observation.

In travelling towards the Valley of Salt we saw vast numbers of antelopes sporting upon the plains, and they secured themselves in caves and woods, among the northern hills. The Valley of Salt is very extensive, and as it cannot have any communication with the sea, consequently the ground must be strongly impregnated with that mineral. This mineral mixes with the waters that roll down from the surrounding hills, and the particles being exhaled by the solar heat, the incrustation follows of course.

This salt is beaten by children with little bats, studded with heads of large nails, and it is then shovelled up by men into heaps, and sent to Aleppo for sale. Some of it gets foul by mixing with the earth, and this is sold to the country people, who boil it up and refine it. The water here is not good, and yet it is much better than some travellers have represented. It is a little brackish; but when it has been boiled, and stood some time, all the particles of salt evaporate, and it is fit for common use.

It was at this place that we formed the resolution of visiting several other parts of Asia, and particularly such as did not appear to us to have been accurately described by former travellers.

The first place we visited was Balereimon, which has a tolerable appearance at a distance; but upon a nearer view, the houses were mean, and obscured by their pagan houses, which were long, large buildings. However, from the numerous ruins all along the country, it appeared that the meanest buildings had been made of the remains of some antient statues celebrated among the heathens.

Here we saw the church of St. Simeon, which is well worthy of the notice of every stranger. The convent is magnificent, according to the taste of the age when it was built, which seems to have been about the latter end of the seventh century; and its situation on the brow of a hill gives it an additional air of grandeur. This building was not erected in memory of St. Simeon, mentioned in the New Testament, but in honour of one Simeon who lived in the times of the emperor Theodosius the Younger, who called the place Mandra, from his austere way of living.

This St. Simeon led a most miserable wretched life for ten years together, in a poor mean cell; and then he mounted a pillar, to which he chained himself by the neck for ten years more. He afterwards caused a nest to be built forty cubits high, wherein he dwelt thirty years; and as it was not more than two cubits in circumference, it is a little surprising he did not some time or other swing in the air; but whether his chain was of iron or hemp, we are not told.

However, in these extravagant and more than romantic situations, he spent the day in preaching to the people who flocked around him, and it is said that he assisted no less than two thousand afflicted of body in one day. The night he spent in prayer, and performed a vast number of cures. The reputed sanctity of the place contributed towards inviting many wild enthusiasts

rafts to settle near the hill, where there are still the remains of several buildings.

From St. Simeon we travelled to the city of Aphreen, and near the middle of Cotma, where we dined; we were honoured by a visit from two emirs, who were little better than two ruffians. These we were obliged to treat with a considerable degree of ceremony, by spreading carpets for them, and entertaining them with coffee. To all this we were obliged to add some presents at their departure; in return for which they invited us to visit them at their own houses; but we did not chuse to comply with their request. Indeed we found their mercenary disposition to be such, that the less we had to do with them the better.

From the village of Calmakthein there is a most delightful prospect; nor is the view of Sinhala less charming, being situated on the declivity of a woody hill, where the farmers have their granaries. From thence we descended to the banks of the Aphreen, where we encamped; and here we found that the appendix to Mr. Maundrell's travels was not written by himself, but by some ignorant person after his death: for how could a gentleman, so accurate as Mr. Maundrell was, mistake the ruins of a palace for those of a cathedral?

Having crossed the Aphreen, we proceeded towards Corus, but in our way thither were insolently stopped by a number of Gourdins, who demanded to know if we had proper passes; and although satisfied with respect to that article, these vagrants swore that we should not go any farther without laying down some money, and giving them brandy and tobacco. Enraged at their bold insolent manner of making this unjust demand, we despatched an account of it to their chief; and although we were inferior in number, we prepared to force our way.

The name of the chief was Chaleel Aga, and he was at that time keeping a grand entertainment with his women at a monument a little way off, on account of the circumcision of his son. He no sooner received the intelligence, than he quitted his females, mounted his horse, and hastened to assist us; and treated us with the greatest civility. He said he could not at all times answer for the conduct of his people, but assured us that we might now consider ourselves as in safety. He ordered our people to escort us a considerable part of the way, which they did with cudgels in their hands, till they came to some rocks near Corus.

Corus is an antient city, and was formerly the place where the famous Theodoret was bishop. The castle of this once famous city stood upon a high rock, and was on all sides in a manner inaccessible.

From what remains of the walls it appears to have been very strong; but we could not find any inscriptions. The houses are all built of a sort of coarse marble; and there are still several grand ruins, one of which seems to have been a theatre.

As we could not procure lodgings here, we pitched our tents on the banks of the Sabone, near a bridge of six mean arches, which seemed to be falling to decay. Here Chaleel dined with us, and such was his goodness and condescension, that he ordered his men to keep guard round our tent during the whole of the night. This good man always rose up to salute each of us, with such a humble deportment that ought to be taken notice of, because the Turks seldom rise up to salute Christians.

Upon a hill not far distant from this place stands Beshaanah, and serves as a watch-tower to give notice of the approach of an enemy; so that they may have an opportunity to prepare for their defence.

Below this place the water is brought in conduits to different grounds, the work being executed with more judgement and skill than could have been expected in this part of the world. Gungeen is a very handsome village, situated in such a manner that it seems to hang upon a rising ground; and in its neighbourhood the rocks have the appearance of iron ore. The mountains all around are steep, and the valleys narrow, but covered with woods, from which they derive a most agreeable appearance. Through the whole of the coun-

try there is no such thing as timber, all that grows being no other than coppice or brush wood.

Here we lost our way, and by four unaccountable accident mounted a rock in the evening, and encamped on a piece of very bad ground: far from repining at what had happened, we were rather pleased with the mistake; for we found ourselves upon the top of one of the highest Gourdin hills. A delicious spring issues from the rock, the different turnings of the river Aphreen regaled our views in several places, and the whole prospect was both wild and agreeable, only the air in the morning was extremely cold.

There is a pleasant village near this place named Ulahan, which, indeed, is the best we saw in the country. It stands on an eminence adorned with vineyards and gardens, making a most beautiful plain beneath, interspersed with groves of olives. The ground here is so high, that it presents the traveller with almost an unbounded prospect. Gouroum is likewise a pleasant village; and in it is a mosque, which seems to be the only one in this part of the country. The rising grounds often deceived us, for one day we imagined we saw a castle on the top of a rock; but we found it was only a pigeon house. Indeed we met with several deceptions of this nature; but such things are so common that they are but little regarded.

From this place we continued our journey till we came to Aintab, where we encamped near a mill upon the banks of a river, which takes its name from that place. Aintab exhibits a very fine appearance, the approach to it being extremely pleasing; for it stands upon several hills, so that the houses look like so many terraces, and there is a view of so many mosques at a distance, built in such a manner, that at first sight they appear like triumphal pillars erected by some of the antient Romans. The castle stands by itself on a high swelling eminence, surrounded by a ditch, cut out of the solid rock. It is true, it appears very well in the place where it is, but could make no defence against a regular army. This in general is the case with all the Turkish garrisons; for these people are so much wedded to their antient customs; that they have never yet made any great improvement in the art of war.

The whole neighbourhood of this city is prettily diversified on the south with hills, and on the other sides with delightful gardens and corn-fields. The air is extremely pure, and the inhabitants would enjoy plenty; were they permitted to reap the fruits of their labour; but this is a privilege denied them.

Traveling through the deserts from Aintab, we passed by a ruined village, and saw a great many villages dispersed on every side all the way; till we came to the river Yalanehous, which falls into the Euphrates. Here the country is pleasant, the hills and vallies being covered with plantations of olives, and a variety of other trees, although far within the boundaries of the desert. In this place, which is called Uroun, there was formerly a church, but it is now converted into a mosque; and near the place where we encamped, was the house of one of the Turkish governors, which had a subterraneous passage leading to the place, but we could not learn for what purpose it was made; perhaps in troublesome times; when the Christians might have had a church here.

A few miles further we were presented with a sight of the Euphrates; but it was a doleful one; for from the loftiness of the Mesopotamian hills on the other side, it seemed very near, while it was really at a considerable distance. Here we found the mornings and evenings cold, while the other parts of the day were extremely hot.

Being arrived at the Euphrates, we had an opportunity of viewing with attention that celebrated river. Its current is rapid, strong and impetuous, and it runs over a vast tract of land. On that side next Mesopotamia stands the city of Beer, built upon several hills, by which we had a view of the castle, town, river, and all the adjacent country; so that our situation would have been very agreeable, had we not been almost scorched to death by the sun. This is indeed the case of most of

the Eastern nations, and often proves fatal to such Europeans as have occasion, either from motives of curiosity or business, to visit them.

The City of Beer is governed by a Mosalem, who is a sort of subordinate basha; and to him we sent our compliments, with better presents than are usually made, in hopes of obtaining permission to see the castle; but we found ourselves much mortified, when we received the following answer:

“What are they who come to make their observations on the grand Signor’s garrisons? Do they take me for a child, that they would feed me with sweetmeats, and dupe me with a bit of cloth? No: they shall not see the castle, should they tarry ever so long, so let them be gone when they will.”

In consequence of this churlish answer, we held a council to deliberate whether or not we should cross the river to visit the city, since we could not be admitted into the castle; but recollecting that a man capable of sending such a brutal message, might be apt to insult us in some other manner, we would not run the risk, so that we could only have the pleasure of saying we had visited the metropolis of Mesopotamia; especially as we knew there was a striking similarity in all the Turkish cities. We therefore resolved to strike our tents after dinner, and quit the neighbourhood of Beer, which we found to be governed by such a bear, that, exclusive of his unmanly insolence, he sent to demand what right we had to encamp on his melon grounds, without his permission, although the place was quite barren and uncultivated.

The boats used in this place are of an odd figure, and very clumsily built. One third from the bow seems to be cut off, and the sides are high and perpendicular. A large piece of wood binds the vessel across at the opening, where the camels enter, of whom it will carry four at a time. It is managed by two men, one of them stands at the helm, with a crooked piece of timber; and the rudder is a great way separated from the stern. At that end which dips into the water, is made fast a square log about a foot and a half long, and the whole is ruled by a crooked tiller. On the larboard side forward, is fastened another crooked stick, with a square piece of wood at the end, which one man manages by way of an oar in the stern; and sometimes the boat is pushed forwards by poles.

There was something so entertaining, and such a variety of objects presented themselves to us, while we travelled along the banks of the Euphrates, that we forgot all the hardships we had suffered in the desert of Arabia. The river consists of a vast body of water, even in the summer; and this is much increased by the winter rains, which bring supplies from numberless streams that lose themselves in its bosom. The rapidity of the winter current is so violent, that it has formed some new channel, which have formed a number of pleasant islands, and upon some of these are several villages, the houses in which being made in the form of tents, are easily removed from place to place, according to the circumstances of the weather, and the clemency or inclemency of the season.

The prospect of Mesopotamia was not without its beauties, for it presented us with a variety of objects, as it abounds with fine painted hills, and the side next the river is finely adorned with trees.

Having crossed the town, and arriving at an old kane and garden, where the river falls into the Euphrates, we once more enjoyed the pleasure of taking up our lodgings upon the borders of this noble river, which here forms large islands, by two detached branches, running with a strong current, about three miles from the great body, to which they return like so many playful infants, who ramble a little way and then return to their indulgent mother’s bosom. Had this great river flowed through Greece or Italy, it would have been celebrated in a thousand poems; for in comparison of it the Tiber is little more than a brook. But alas! we find little concerning it among the water of the antients, only that it is celebrated in the sacred history, which does it more honour than any thing from the pens of the most celebrated heathens.

From Beer we pursued our journey through some wild and barren spots, which might justly merit the name of the Deserts of Arabia, and we arrived at the city of Jerabolius, which is watered on the eastward by the river Euphrates. Here are no monuments of antiquity worth mentioning, except one tomb, which seems to have been erected in memory and honour of a Christian bishop, by the robes with which the figure is clothed.

We afterwards travelled over several mountainous deserts near the banks of the Euphrates, until we arrived at the Sadigour, the banks of which are so rocky, that it is dangerous to ride along them. Having crossed this river, we pitched our tents on the other side, where we encamped for that night, after being much fatigued with travelling.

The next day we arrived near the stately ruins of Bumbouch, where we refreshed ourselves with some excellent punch, and were visited by the captain of a neighbouring village, who brought us an antelope by way of a present.

It was melancholy indeed to behold the ruins of this once famous city, which had been three miles in circumference, surrounded with walls, well built of polished stone, six feet thick, with square towers and bastions in the antient manner.

This place had been formerly supplied with water conveyed through subterraneous conduits from a great distance at a vast expence. They might be traced many miles by the air shafts that had been sunk, and out of which it is not unpleasant to see wild figs spring up in a country otherwise extremely barren.

When the Persians were subdued by the Greeks, the latter found it extremely difficult to procure water in this part of the country, so that they were obliged to go to water and feed their cattle at the eastern part of the city; and here it was that the sacred cattle were kept for sacrifice, as we are informed by Pliny, Strabo, and many other antient authors, who have written largely concerning these things.

Here are several remains of antiquity in this place, some of whom have been formerly Christian churches, but they are now converted into mosques.

The Aga at this place sent us a guide to conduct us to the last place that night, whereat we lodged. We pitched our tents, and had a good supper, and were treated by the poor country people with great tenderness. Here is an extensive fertile plain surrounded by hills and villages, all of which seem to have been meanly built, but the prospect is delightful, presenting many delightful gardens to the view, instead of barren, desert, and uncultivated fields.

The next place we visited was Baab, pleasantly situated on a rising ground, from whence there is a most extensive prospect; and here stands a mosque, dedicated to the honour of one of the false prophet’s successors. Descending the hill from this mosque, we were met by a parcel of Italian Jews, who appeared like so many mountebanks, followed by a ragged crew of disbanded sailors and janisaries.

One of them was dressed like a merry-andrew, with a lance in his hand; another wore a Turkish habit, with a white sash. As we did not at first know who these Jews were, nor indeed that they were Jews at all, so we considered him in the Turkish dress as the chief magistrate or Aga of the place, and as such paid our respects to him. But how great was our surprise, when we found that he was no other than a rascally usurer belonging to one of the tribes of Israel.

On a pleasant stream running from Baab is situated Tediff, where there are many fine gardens, which brought to our remembrance some of those we had seen in England. There is a famous synagogue belonging to the Jews; and the women believe, that if they attend divine worship in it, they will become pregnant.

We were told that the prophet Ezra spent much of his time here, but that might have been before he returned from the captivity. This day we pursued our journey, and arrived at Aleppo, after having under-

gone a variety of fatigues, but then it must be plain to every person, that knowledge is acquired by experience.

We cannot conclude this part of our narrative, without taking some notice of things that could not have been properly mentioned before without confusing the reader; a circumstance we have hitherto avoided as much as possible. And first, with respect to the manners and customs of the Turks.

These people are naturally savage and untaught, consequently their manners must be brutal. Their politics consist of fraud and dissimulation, and they are ashamed of nothing that is mean or base. They never seek to acquire esteem, but rather to tyrannise over their fellow creatures; and their government is maintained by the most arbitrary measures that oppression, interest, avarice, and corruption can suggest. The text of their law is the alcoran, a soil so fertile of chicanery and deceit, that it may be expounded a thousand different ways, according to the caprice or villainy of the judge. Nay, it frequently happens that such of the judges as are so incorrupt as to refuse bribes, are yet weak enough to do injustice, by obeying lawless power.

The next place we visited was Danah, where we sought for antiquities in vain; for although this place was formerly considerable, yet at the time we visited it, it was little better than a contemptible village. Here are some fragments of a Gothic building, which seems to have been formerly a Christian church, but by whom built, or at what time, is uncertain. Here are also the remains of a convent, where there is a spacious cistern that yields the most excellent water. It is covered with large pieces of marble, supported by square pillars of the same materials, and this supplies all the neighbouring villages. The place is delightfully situated on an eminence, in the middle of a charming plain, surrounded by beautiful low hills, on the declivities of which were some pleasant villages, now reduced to ruins, except a few, which are converted into miserable huts. The fields are cultivated with the utmost regularity; and while we were there, the men and women were employed in reaping. This work they performed by cutting off the ears, and pulling up the stubble, which method has been always followed in the east.

Here is a monument of a very particular structure, from whence is derived a tradition, that Johannes Damascens preached the gospel in this place, and converted a multitude of sinners. It is much revered by the Christians of those parts; but these people who assume that name, seem to know nothing of the gospel; and this naturally leads us to say something concerning the Gourdins, or, as they were antiently called, Assassins. Some of their spawn yet remains, and they are, perhaps, the most barbarous wretches that are to be met with in the universe. Their prince was formerly elective, and professed Mahometanism; but in reality was of no religion at all. His subjects were robbers and murderers; they lived without law, without fear, and without any regard to duty. They offered their services to the Knights Templars, but that was rejected, because they were looked upon as a body of people that ought not to be trusted. However, in this instance the Knights Templars were much to blame, because had they engaged in a league with these men, they might have been able to keep possession of the city of Jerusalem; but superstition ruined all.

There is nothing mentioned in history relating to a city having been formerly in this place; and yet we saw so many ruins, that we could not conclude but that this place had been famous in antient times. Who would remove ruins from one place to another? Such things are local, and point out that there was something there originally.

The next place we visited was Byafs, a pleasant sea-port town, surrounded by gardens; and here we found a place for tradesmen to keep their shops in, much like our Exeter-exchange in the Strand, and kanes, or caravancies, for the use of travellers. A

kane is a large court, resembling one of our public markets, with buildings around it for the accommodation of travellers; and these are maintained at public expence; for there are no inns in Turkey. It is very remarkable that the inhabitants of these eastern nations never considered the nature of hospitality, by having inns for the reception of travellers; but then we must make some allowance for the afflictions under which they labour, the miseries they suffer, and the hardships they are daily exposed to.

The next place we visited was Antioch, pleasantly situated on the banks of the Orontes, and extends two miles in length; although the whole is very mountainous, we made a shift to climb up these mountains with great difficulty, as we were determined to see every thing worth notice in the country. But our descent was still more difficult; for we were often in danger of being dashed in pieces over the most dreadful precipices.

Antioch, which is the Riblah of the Old Testament, was built by Antigonus, but was afterwards finished and enlarged by Seleucus. It was many years the capital of Syria; and here was formerly a bishop's see. In this famous city the followers of our Saviour first received the name of Christians; but since that time it has undergone a variety of revolutions. The walls are large and extensive; but they have been suffered to fall to decay ever since the times of the crusades; for it is plain, they were erected by Christians.

There are many square towers erected at small distances from each other; and in each of them soldiers formerly used to do duty, when they were under the apprehension of the approach of an enemy. On the most easy part of the ascent, the walls are eight feet thick, furnished with a parapet, which cover them from without, and with steps that rise from tower to tower; but those on the top of the hill are not so strong. The whole work is of hewn stone, except the arches, which are of brick, as being less subject to the effects of earthquakes. In some of the towers there are no steps, but only easy winding ascents; and without the gate leading to Damascus, there has been an aqueduct of five arches, but very mean; and at that of Latachia stood a large building; perhaps that which some authors suppose to have been the temple, or rather the palace of Silenus; but of this there is no certain proof the whole being involved in the darkness of oral tradition.

A little to the southward, the ruins of a church seem to hang over a rock; and near to this place are the remains of a church dedicated to St. Paul, and built by the emperor Constantine the Great. This was formerly a place of great repute, because councils were held in it; and here we were shewn the spear that pierced our Saviour's side. At present the greatest part of the structure has fallen to the ground, only some of the walls being now remaining. On a rising ground are the remains of a most magnificent castle, and near it a cistern, one hundred and thirty-five feet in circumference. It appears that there was a temple dedicated here formerly to Mars, but little remains of it are now left. It seems to have been designed as a repository for arms; but the inhabitants, who are mostly Turks, have paid so little regard to it, that now it is only a ruinous building, having nothing to recommend it to the notice of a traveller, but that it was once a place of antiquity, and respected in former ages.

This famous city of Antioch continued to flourish in great splendor many years, till it was taken from the Greeks about the middle of the seventh century, and afterwards retaken by the Christians, under Godfrey of Boulogne, who erected it into a principality, according to the laws of the feudal system. About the middle of the thirteenth century it was destroyed by one of the sultans of Egypt; and since that time it has never recovered its antient grandeur. There are but few inhabitants in the place; and most of them are so wretched, that they hardly know what it

is to enjoy the necessaries of life. The gardens around Antioch are very pleasant; some of them being laid out with taste, and others situated in such a manner that they commanded a most delightful prospect. But then it must be remembered, that the Turks have no taste for any thing of an elegant nature; for they are so brutish and clownish, that they never discover any laudable ambition, but content themselves with copying servilely the manners of their ancestors.

Aleppo succeeded as the metropolis, and became the seat of a pacha, which brought the trade to it from almost every part of the known world. Had the Europeans been wise enough to have fixed the centre of their trade at Aleppo, it would have been of great service; but they forgot their interest; and a superstitious attachment to some things of an indifferent nature made them neglect those duties they owed to themselves, and to those countries where they were born. In this case the pacha would soon have found it for his interest to have moved the seat of civil dignity from Aleppo to Antioch; but this was totally neglected.

At each end of the city of Antioch were famous suburbs on each side of the river; and in one of them was the monument erected to the memory of the noble Germanicus, who was poisoned by Cneius and his wife Plamira engaged in that horrid affair by Tiberius, and the odious Livia. The body was burnt on the spot where the monument was erected; and as Tacitus says, the ashes were put into an urn, and carried to Rome, where they were deposited, by order of the emperor.

Tacitus further adds, that there was a tribunal erected at Antioch by Germanicus; but the barbarous Turks have so far demolished all the monuments of antiquity, that nothing of it now remains.

From this place we proceeded to visit Selleua; but our stupid guide was so ignorant, that he led us by a contrary way; but although disappointed, yet we had an opportunity of seeing some things that gave us no small pleasure. We were frequently near the banks of the Orontes; and we crossed several beautiful streams that fall into that river. All along, the banks are adorned with pretty villages, and the most beautiful silk-gardens.

Souldi, about three miles distant from this place, stands in a very barren soil, there being no trees in the neighbourhood. It is about three miles distant from the sea; and full six miles from where the port stood in antient times. From what at present appears, the harbour must have been safe and commodious, but such devastations has time made, that there are no remains of any thing left, by which its antient grandeur can be known.

The antient port, of which there are still some remains, is formed by two keys, consisting of stones immensely large, running out a great way into the sea. One of these stones is perfectly entire for about thirty feet, and in breadth forty-five feet. The basin is about eight hundred feet wide, and from appearance it must have been tolerably deep; though now it is so choaked up with weeds, that it is extremely shallow. Were the Europeans inclined to establish a factory at Antioch, instead of Aleppo, it would be of great and almost infinite advantage to them, but nothing of this nature have ever yet been attempted.

From what remains of this city, it seems to have been grand, and in all respects magnificent. The walls in many parts have been thick, and well-built of large stones; but it was with great difficulty that we could find any inscription. In one place, indeed, we found a tombstone, on which was the figure of a gladiator fighting with sword and buckler, and some other such instruments as were generally used both by the Turks and the Christians, during the time of the Crusades, vulgarly called the Holy War.

Having seen every thing worthy of notice in this place, particularly a subterraneous passage cut out of the rock, we returned to Aleppo, where we found our

good friend Dr. Russel, who was of great service to us, especially as we had contracted agues and other disorders. But our curiosity was not to be restrained by the prudential advice given us by Dr. Russel, for having acquired new companions, we soon set out in order to make some discoveries concerning antiquities.

Furkia, the first place we reached, abounded with many remains of antiquities, such as ruined temples and columns; some of which are in the Corinthian order. Near to this place we found many beautiful villages; but most of the inhabitants had deserted them, in order to avoid the more than cruel exorbitant taxes imposed upon them by the Grand Seigneur, and which in all cases are carried to an exorbitant height by the bashas of the provinces, whose avarice, ambition, and cruelty, go hand in hand together.

About ten miles to the westward of this village there is, in the midst of a plain, a hill in the form of a sugar-loaf, where the people believe Job was buried; and here it is not improper to remark, that as there are traditional accounts of all the great persons mentioned in the Old Testament; so that sacred history must be true, for could all these Eastern nations conspire together to tell one uniform story of their own invention?

Passing from hence through a delightful valley, situated between rocks, mountains, and covered with vineyards, which form a delightful contrast, we arrived at Magara, and pitched our tents near the ruins of that Town. Here we saw a large burying place cut out of a solid rock of marble, the roof of which looks very noble, having the appearance of large square beams with mouldings, and a pretty sort of cornice all round. It appears to have been formerly supported by large columns, which are now broken; and it was in all probability designed for other purposes; for it has had several apartments, with a passage round, to which there is a communication for the reception of water; and what is very remarkable, there is a subterraneous passage from thence to Furkia, which is several miles distant. Near it is another sepulchre, but there is not on either of them an inscription, or any other mark to point out by whom or at what time they were built.

Returning from hence to Bava, we saw a large grotto in the rock, on one side of which was an episcopal figure, with a crozier in the right hand; and in the angle on each side was an angel holding a laurel wreath in one hand, and an olive branch in the other. The next day we pitched our tents near the river Singas, not far from the ruins of the antient city of Chalcis, but called by the Turks Old Aleppo.

In the street of New Aleppo leading towards Antioch, there is a large square stone, supposed to be endowed with great virtues. Whenever the people are seized with some slight disorders, they rub themselves against it, and then they imagine that they are healed. In this town is shewn a tomb, said to be that of the prophet Zachariah; of which the natives relate the following story: The grand vizir about sixty years ago, dreamed, that this tomb lay in some obscure place, and ought to be removed to some spot where the devout might have an opportunity of visiting it. Search was immediately made for it in Aleppo, and it being discovered under an old wall, the basha, cadi, and principal inhabitants, went in procession to fetch it. They afterwards fixed it in a conspicuous place in their chief mosque, with the following inscription on it:

“The tomb of that honourable person, the prophet of God, Zachariah (the peace of God be upon him), was repaired, after its long concealment, by the command of the grand vizir, in the days of our lord, the victorious sultan Achmet Chan, son of Mahomed Chan (God prolong his reign), in the year 1120 of the Hegirah.”

According to the notions of the Turks, and their antient traditions, the castle of Aleppo was built in the time of Abraham, whose native country, Mesopotamia, was within a few days journey of this place; and where resided Zachariah, a famous prophet. The prince of the country being desirous of marrying a beautiful

beautiful young woman, who had captivated his affections by dancing before him in a wanton manner, while his first wife was still alive, Zachariah opposed his designs, from a purity of soul, and love of religion, refusing the most liberal proffers, with which the prince endeavoured to purchase his assent. Finding the prophet was not to be corrupted, the tyrant resolved to gratify his desires, in spite of every remonstrance expressed by Zachariah, whose head he ordered to be struck off, and put into a stone urn, two feet square, upon the top of which was this inscription: "This stone incloses the head of the great prophet Zachariah." It remained in the castle till about eight hundred years ago, when it was removed into an old Christian church in the city, afterwards turned into a mosque, which in time decaying, another was built near it; and the place where the head was deposited had been choaked up by a wall. The grand vizir Churley ordered the urn to be opened; when it was found to contain perfumes and spices to the amount of four thousand pounds.

Having followed the learned and accurate Mr. Drummond through Syria, and again to Aleppo, we shall now, in the words of Dr. Russell give an account of that city. Dr. Russell, was an eminent physician, and fellow of the Royal Society; he had resided many years at Aleppo, was the intimate friend of Mr. Drummond, and dedicated his description of that part of the east to him.

Haleb, called by us Aleppo, is built upon eight small eminences, the middle of which is higher than the rest, seeming to owe its elevation to the earth thrown out of a broad deep ditch, with which it is surrounded, and on the top is a very strong castle. The circumference of this city, including the suburbs, is near about seven miles; and although inferior in riches to Constantinople and Cairo, yet in regard to buildings it yields to no town in the Turkish empire. The wall that surrounds it is old and decayed, and the ditch is laid out in gardens. The houses are built square, and of straw, consisting of a ground floor, and an attic story, with flat tops, either paved with stone, or spread with plaister; their cielings and panels are neatly painted, and sometimes gilded; so are their doors and windows, over which are generally inscribed some verse out of the Alcoran, or quotation from the most celebrated of their poets. The streets have a dull appearance, their houses being shut up by dead walls, within which is frequently found a neat paved court, with a fountain in the centre, surrounded with a little verdure, which would look extremely pleasant, were it laid open to the view of passengers.

People of fashion have a room or two below stairs for themselves, one of them tolerably cool, being commonly a large hall with a cupola roof, and a fountain in the middle. The rest of the ground floor is roughly paved, being used as a stable for their horses. Above stairs is a colonade, running sometimes round the whole of the court; so contrived by having holes in the front and sides, that there is a fine cooling breeze of air in summer.

There are many mosques in Aleppo, and some of them very magnificent. In the area of each is a fountain for ablutions or bathing, and sometimes a little garden. Cypress is in such plenty here, that besides the common gardens, every house has at least one tree; but all the beauty is lost to those who walk the streets. There are many good kanes for the reception of travellers, wherein they not only lodge, but likewise transact various sorts of business.

Their shops are small, and often contain no more goods than are manufactured by the shopkeeper himself. He has always a clerk to attend him, but the buyer stands on the outside. It is remarkable, that although their doors are all covered with iron, yet their locks are all of wood. Some of them are kept open till half an hour after sun-set, but most of them shut up sooner. The streets are narrow, well paved, and extremely clean. The tanners, lime-burners, butchers, and all trades where the smell is offensive, are obliged to reside

in the suburbs; and there is a large field for the slaughter houses. They have a small manufactory for coarse white glass, but it is not carried on above four months in the year, they being obliged to bring the sand from a great distance. There is an aqueduct, by which water is carried into the city, and distributed through the different streets, by means of pipes; and besides this, every house has a well; but the water being brackish; they use it only to wash court-yards, or to supply their fountains for bathing.

They use wood and charcoal for fuel; but they heat their bagnios with the dung of cows and horses, which they employ the poorer sort of people to gather.

A vast plain begins on the east of Aleppo, and although many parts of it are fertile, yet it is all called the desert. Both on the north and south, at a few miles distance; the ground begins to grow flat, and is free from stones; but near the city, and for twenty miles to the westward, it is rocky. The western parts of the city is washed by a narrow stream, called Coic, and it is used to refresh some gardens lying on its banks.

Inconsiderable as this stream may seem, yet it is of great service to the inhabitants of that hot country; where, in many of the villages; they are obliged to save rain water in their cisterns. There is but one large river in Syria, namely, the Orontes, which although swelled with a number of little brooks as it runs along; as well as by the lake of Antioch; yet where it disembogues itself into the Mediterranean, it is far from appearing formidable. There are, in deed, several inconsiderable streams, but they lose themselves in the sand, after running a few miles, none of them being able to reach the sea.

The people often sup in the court yards; or on the tops of their houses; the air being free from all sorts of damps. The seasons are extremely regular. From the 12th of December to the 20th of January, it is generally very stormy; yet during that time the sun is frequently warm about noon. The snow seldom lies longer than one day upon the ground, and the ice is not strong enough to bear a man. Even in that season the narcissus flourishes, and to it succeed the violets and hyacinths.

From May to the middle of September, the weather is excessively hot; not a cloud obscures the sky, nor is there one refreshing shower. The hot winds that now inspire with languor, and cause a difficulty of breathing, must be shut out, by closing all the doors and windows. These winds lasts generally about a week, and are not productive of so many diseases as those in the deserts, owing to the suddenness of the latter.

There are no corn fields near Aleppo, although there are several near Antioch; and on the coast of Syria. Here are some plantations of tobacco, but there are many more further up the country, particularly between Skogie and Latachia, whereby a considerable branch of trade is carried on with Egypt.

Here are some few olives about Aleppo, and grapes that yield both red and white wine. The red is poor, thin, and mild; but the white is strong and heavy, leading to sleepiness, and provoking stupidity rather than mirth. They distil a spirit from raisins and anniseeds, which they call arrack; and of this, as well as of wine, both Jews and Christians are extremely fond.

As for the Turks, it is contrary to their law to drink wine, so that the grapes in these countries are but little regarded.

They have plenty of all sorts of garden roots and herbs, but their fruit are in general poor. There are no metals found in Syria, although from the appearance of the rocks it would seem that there were great quantities of iron ore found near Antioch; but the soil being rocky, they cannot, without great difficulty, procure a sufficient quantity of clay to make bricks. The clay for the use of the potters is brought from Damascus and Sidon; and they have a sort of clay which they use in bagnios instead of soap. It is made up in little balls, and stuck full of rose leaves, to give it an agreeable smell. Many of their common build-

ings are of a coarse gritty stone, plenty of which found near the city, it being easily cut, and hardens afterwards. They use a yellow marble, which takes an exceeding good polish, and of this they make their gates and pillars. Lime-stone is in great plenty near the city, and affords a good cement for buildings which are carried on without scaffolding.

They have no great plenty of black cattle, and such as are used for draught have long legs and large bellies; and there is a smaller species, with short horns. The Turks and Jews scarce ever eat beef, though the Europeans find it tolerably good at all seasons. There are vast numbers of buffaloes to be found in every part of Syria, but at Aleppo the female ones are chiefly kept for milk. Mutton is more esteemed than all other sorts of flesh meat in this country, and what they have is extremely good, well fed, and wholesome.

They have two sorts of sheep, the one called *bednin*, much like those in Britain, but their tails are larger and more covered with wool. The other sort, which are more numerous, have tails of such an extraordinary size, that the shepherds, in order to preserve the wool, make little slight wooden wheels, which they bind to their hams, and let the tails rest upon them. These wheels are by the sheep easily drawn from place to place; and some of the wool on the tails amounts to above twenty pounds in weight.

They have a species of goats here with prodigious long ears, and broad in proportion; their milk tastes well, and is sold about the streets in the month of September.

Aleppo is well supplied with butter and cheese, made indiscriminately from the milk of cows, buffaloes, sheep, and goats, of all which the Arabs have large flocks, with which they travel all over Syria, in the same manner as the patriarchs of old did.

Here are vast numbers of antelopes all around Aleppo, and these are of two sorts. That which is called the mountain antelope is the most beautiful; its back and neck being of a dark brown colour. The antelope of the plain is neither so swift nor so well made, but of a much brighter colour. Both of them yield excellent sport; but they are so swift, that it is difficult for the greyhounds to take them, unless when the chace happens to be in heavy grounds. They are lean in the sporting season, but in summer they are as fat as the venison in England, and their flesh as delicious as can be imagined.

Such dainties, however, are only served up at the tables of the Europeans, who pay for them, and to the richer sort of Turks, who can do as they please.

There are great plenty of hares here, but they are little regarded by the natives. The Arabs, however, hold them in much esteem; and when they have killed them, they dress them in the following manner:

They dig a hole in the earth, which they fill up with brush-wood, and set it on fire. They then throw in the whole body of the hare just as it was taken, and when the flame is extinguished, they cover the hole up with the loose earth that had been dug out of it, and which had been laid round the verge of the fire, so as to grow hot; when they think it sufficiently baked, they take it out, and eat it, without any other ceremony.

There are some tame rabbits kept in this city for the use of the Europeans, and sometimes a wild hog is taken in the country, which, although seldom fat, yet the gentlemen of the factory consider it as a very great rarity. There are several other creatures in these parts used by the Europeans, but they do not merit a particular description.

The Arabs who visit Aleppo are in some respects like those Tartars, whom we have already taken notice of in the course of this work, that eat the flesh of camels; but this is never done by the Turks. Indeed the Turks, whatever was their original, are at present much attached to eating what were of old called clean beasts; and as they look upon the flesh of camels as no better than carrion, consequently they never touch it. They have several sorts of camels, some

of which are strong, and others weak; and all the different sorts are to be found throughout Syria:

They had formerly a fine breed of horses, but they are now much degenerated. Some of those belonging to the Turks are handsome, but the Arabian ones are more swift, which seems to be owing to exercise. There are some hyzæna's found in the mountains here, but they never meddle with any person, unless compelled by hunger or assaulted; but they are not so civil to the flocks in the fields, whom they devour without mercy, particularly the sheep, whom they eat as the most delicious morsels.

Though there are vast numbers of dogs continually to be met with in the streets, feeding on the most putrid substances, yet we never heard of any of them running mad. This disease however affects the wolves who come down from the mountains, and bite both the shepherd and the sheep; and whether men or beasts are bit by those animals, they are sure to die raving mad.

The greyhounds here are slender, swift, with long ears and tails; and upon the whole, they are the most beautiful we ever saw. Here are various kinds of serpents, which fly when any man approaches them; and in summer they find but very indifferent subsistence on account of the heat. A large, white serpent is often found in the flowers; but we never heard that the bite was dangerous. The scorpions often sting the people in their houses, but with no other bad consequences than giving them a little pain for about an hour. In one season there are millions of locusts which infest this coast, and they all come from the north. The devastations made by them among the fruits of the earth, is amazing and incredible; but we saw many flocking instances of it. The wild Arabs eat these insects, when fresh and pickled. Some of them are rare delicacies.

Bees and silk-worms are in great plenty, and the honey is more delicious than any in Europe. Lizards and toads are numerous all over Syria; but the people are no ways afraid of them.

They have many fowls here, common with those we have in Europe, and others peculiar to themselves. This is the native country of the carrier pigeons, formerly used by the Egyptians, to give an account of the arrival of ships at Scanderoon; but this practice has been discontinued some years.

The pigeon thus employed was one that had left its young at Aleppo; and a small piece of paper containing the ship's name, and a short account of the cargo, was put under the wing of the pigeon, to prevent it from being wetted. The feet of the creature was bathed in vinegar, to keep them cool, that they might not settle to drink or wash themselves. Shooting is practised here only as an amusement, only that some of the ordinary people kill hares for a subsistence, there being no game laws in this country.

When they hunt the antelope, they chuse out such hawks as are most fierce, and they are taught to fix upon the cheek of the animal, thus retarding its motion till the hounds come up.

The falcons used for hare hunting, will sometimes, when hungry, strike the animal dead at once, but yet there are others which often prevent them from going on in their course, till the hounds come up.

In bird hawking, they use a large long-legged falcon, with two of a smaller size, one of which, though not larger than a pigeon, will bring down an eagle, and seizing it under the wing, deprives it thereby of the use of that part, or else fastening on its back between the wings, so that both fall down slowly to the ground, where, if the falcon is not at hand to assist his feathered help-mate, it is inevitably destroyed. This little bird is called the *shakeen*, and must be taken young out of the nest, being so fierce, that it will fly at any thing, unless properly taught. There are several sorts of fish found here, particularly plenty of crabs, which furnish out many delicate dishes for the Europeans. The black fish found here, and much esteemed, is far from being wholesome. The people, however, are so

fond of it, that they prefer it to all others whatever. They take vast numbers of them in the latter end of September; which, when properly pickled, will keep till the latter end of March.

The inhabitants of Aleppo, although of different religions, yet seem to have all the same morals; for the Christians are no better than their neighbours. The number of people in this city and suburbs is computed at two hundred and thirty-five thousand; of which two hundred thousand were Turks, thirty thousand Christians, and five thousand Jews.

Of the Christians, the greater number are Greeks; next to them Armenians, then the Syrians, and, lastly, the Maronites, each of whom has a church in the suburbs. The language is a sort of vulgar Arabic; but the Turks speak their own language. Most of the Armenians speak the Armenian; some few of the Syrians speak the Syriac; and many of the Jews, Hebrew; but scarce any of the Greeks understand one word of Greek, whether antient or modern.

The people, in general, are of a middle stature; rather lean than fat, and indifferently well made; but neither active nor vigorous. Those of the city are of a fair complexion; but the peasants, and such as are employed in the fields, are swarthy. Their hair is either black or swarthy, like the chestnut colour; and it is very rare to see any of them without black eyes. Both sexes are tolerably handsome when young; but the beards soon disfigure the men, and the women fade before they are thirty. The greater part of the women are married between the age of fourteen and eighteen; for if they stay longer, they seldom have any children.

They know nothing of courtship, for the young persons seldom see each other till all things relating to the marriage is settled. A slender waist is so far from being esteemed or admired, that it is considered as a deformity; so that the young women do all they can to make themselves appear plump and lusty. The men are girt very tight round the waist with a sash; but the women's girdles are not only slight and narrow, but loosely put on, which, with the warmth of the climate, and frequent use of the bagnio, is probably one reason why their labours are more easy than the labours of those in Britain. The child-bed confinement of the most delicate seldom exceeds ten or twelve days; and the women in the villages are generally able to attend their domestic offices within two days.

It is a grand rule and constant practice for every woman to suckle her own child; and they are seldom weaned till they are three or four years old, unless the mother happens to be again with child. All the Turks of superior fashion in Aleppo may be considered as polite and courteous in their behaviour, when we consider that they are taught to look with contempt upon all those of a different religion from themselves. As for the common people, an affected gravity, with some share of dissimulation, generally forms their character; and although few people in the world are more quarrelsome, yet they seldom fight. One can hardly pass along a street without being witness to some noisy broils, and yet it seldom happens that a blow is struck. But although they are so prone to quarrel upon the most trifling occasions, no people in the world can be more calm when it is their interest to be so.

The coffee-houses in Aleppo are only frequented by the vulgar, where they are entertained with a concert of music, which, for the most part, consists of something bordering on obscenity. These, properly speaking, are all their public diversions; for without buffoons, all their public entertainments would be considered as insipid and languid. This may serve to shew, that the Turks have no great taste for those sorts of entertainments which contribute towards humanizing and civilizing the manners.

Within doors they spend some part of their time at chess, with back-gammon and draughts; at all which they appeared to be very expert. They that win have the privilege of blacking the face of the loser, putting a fool's cap on his head, and making him

stand up, while they sing verses in order to deride him. But it is only the lower sort of people that will submit to these indignities.

Some of the Greek Christians have been taught by the conduct of the Europeans to play for money; but the generality of the Turks play only for amusement; to pass away the long winter evenings. Sometimes, but very seldom, they will play for a moderate entertainment; but this is only among people of fashion.

They never reckon dancing as an accomplishment for people of fashion; and it is seldom practised among the vulgar, except by those who make a trade of it. Their dexterity consists chiefly in the motions of the arms and body; in putting themselves into different attitudes, many of which, especially among the women, are not very decent. At their festivals they have common wrestlers, who, in their actions, seem to bear some affinity to what we read of the antients; for they have no manner of garments on besides a pair of breeches; but they make the most sorry figures in all their performances.

The bread here is extremely bad; being not well fermented, and very badly baked; so that they are obliged to eat it almost as soon as it comes out of the oven. The better sort of people have fine small loaves, much better prepared and baked than those we have just now mentioned; and besides these, they have rusks and biscuits. As for the Europeans, they have bread baked according to the manner of their own countries; but the French fashion is the most prevalent.

Coffee is more esteemed here than any other sort of liquor; and they drink it without either sugar or milk. Sometimes they eat a few sweet-meats before they drink it, but that is seldom; and a pipe of tobacco is the usual entertainment at a visit. If it is a visit from a basha, he has a fine horse presented to him at his departure; but those of an inferior rank present only a flower, or something of that nature; but every one must present something. This may serve to shew, as we have hinted before, that the Turks are a mercenary people; seeing they can thus so meanly sell hospitality, which should always be free.

Here, as in Holland, tobacco is smoked to excess by the men at all times, and frequently by the women; nay, we seldom saw any of the poor peasants without a pipe in their mouths. These pipes are made of the twigs of the rose, birch, or cherry-tree; and those of the higher ranks of people have theirs mounted with silver. The mouth is clay, and often changed; but the pipes will last many years. Some of them have pipes made of glass, and smoke the tobacco through water, which gives it a cooling flavour before it comes to the mouth. But this practice is not confined to the gentry; the people, even of the lowest rank, will always imitate their superiors. Thus the vulgar have, at their coffee-houses, an ordinary instrument of much the same nature, in which they put the tobacco, wetted a little with an infusion of raisins; adding sometimes several other things, to make it of an intoxicating nature. Opium is in great plenty here, but not held in the same esteem as at Constantinople, and several other parts of Turkey. Some of the people here use it to excess; and these have, generally, a most besotted look, nor do they often reach to old age. They lose their memory, with the other intellectual faculties, in the same manner as those who decline under a number of years. Few Turks have any notion that exercise gives pleasure, or contributes to preserve health; except some of the better sort, who are persuaded to it from the example set before them, by some of the European gentlemen who reside in the factory. As they have no coaches, people of quality ride on horseback in the city, with a number of servants walking before them, according to their rank; which, although not convenient in bad weather, has certainly a more majestic appearance than our coaches.

The ladies seldom go abroad; and when they do, they are obliged to walk on foot; but when they go on long journies, they are carried in a litter by mules. Those of a lower rank are carried in things of much

the same form as our panniers; for whether they are poor or rich; the women are seldom seen in Turkey, nor in Asia in general:

Most of the natives go to bed soon; and rise early in the morning, attending to the old maxim which experience taught, and which has been repeated by a thousand moralists, viz:

Early to bed, and early to rise,
Is the way to be healthy, wealthy, and wise:

They sleep in drawers and flannel waistcoats; and this is one of the reasons assigned why the people in Turkey are so swarthy. For certainly any thing of woollen next the skin is not so wholesome as linen; because it prevents perspiration, and keeps the corruptive matter within the porous parts of the body. When they wake in the night, they sit up, fill their pipes, have a quart of coffee made; and sometimes in the long nights in winter they eat some sweetmeats, after which they fall asleep again. This is to all intents and purposes a sort of sensual Epicureanism which some writers ascribe to the climate; but that can never be the case; for in all climates, and in all seasons, the virtuous man will find a proper opportunity for the exercise of his rational faculties.

In the summer their beds are made in the courtyards of the houses, and sometimes upon the house tops; but in winter they chuse the smallest room on the ground floor. There is always a lamp burning, and frequently two or three pans of charcoal, which sometimes produce the most fatal consequences, especially to strangers who are not accustomed to such things.

It is well known that the people in this country once made a considerable figure in literature, but now they are extremely ignorant. Many of their bashas, and other superior officers, can neither read nor write; but of later years, some more regard has been paid to the education of youth than formerly. However, at the best, it extends no further than just to read the alcoran and some comments they have upon it. Some are bred to the law, that is, to act as magistrates or judges; but no encouragement is given to the study of philosophy, nor indeed to any of those arts and sciences for which we in this part of the world are so much distinguished. Physic is not in the least attended to; for they look upon the fundamental part of it, anatomy, as a horrid practice.

During the whole fifteen years we resided in Syria, we never met with more than one man who understood the most simple principles in astronomy; and all he knew, was, the art of calculating an eclipse, which occasioned him to be looked upon as a very extraordinary person. Indeed the people are such slaves to superstition, that they imagine all knowledge is to be acquired by astrology.

And here it may not be unnecessary to take notice of one circumstance which has not been mentioned by any writer concerning Turkish affairs, and that is, they have here a vast number of colleges founded and endowed for the education of youth, but little regard is paid to them. As in the countries where the Roman Catholic religion is professed, debauchés generally found and endow convents; so here in Turkey, vices of a different nature operate in the same manner. It cannot be expected that there should be in Turkey such persons as we call debauchés, because a plurality of wives is allowed; but there are other vices, and some of these are of a much more dangerous nature, and more fatal to society.

Amongst these vices may be mentioned avarice, which, when it takes a deep root in the human mind, leads to the perpetration of such crimes as will always disgrace human nature.

The Turkish magistrates are the most rapacious wretches in the world, for they torment and oppress the poor people in such a manner, that they scarce leave the soul and body together. This is the common way of superstition; and hypocrisy induces those

wretches; in order to make an atonement for their crimes; to found colleges, and leave some part of that money to the poor; which they have illegally taken from the industrious. But it is needless to insist on this:

Although the Turks are great predestinarians, yet they never carry things to such a height as to neglect the use of proper means; for they say, that when God ordained every thing in this world to take place; he laid no restraint on the human will. This is the reason why they use simples in medicine; which they look upon as infallible; because (say they) God never sent a natural evil into the world; without at the same time pointing out some remedy for its cure.

Both men and women in Turkey paint their faces; and when the men advance so far in years, that their hair begins to turn grey, they dye it black with a composition made for that purpose.

The women in some of the villages, and all the Arabs who visit Aleppo, wear rings in their nostrils, and they frequently mark their under lips and chins with a bluish paint; a practice common among the antient Scythians.

What is here mentioned, is not however a general practice, but only peculiar to some, just in the same manner as our customs in England differ from the court down to the meanest peasant. Many travellers have represented the Turks as people very abstemious; but upon enquiry and long experience, we found the reverse. Nay, they are rather voluptuous, as will appear from what we are just going to relate.

As soon as they rise in the morning, they breakfast on fried eggs, cheese, and honey. About eleven o'clock in the forenoon they dine; and all their tables are round, garnished with dishes made either of silver or copper tinned, the whole being placed about fourteen inches from the ground. Pickles, sallads, with bread and lemons, are disposed of in a proper manner round the edges, the middle being reserved for the dishes containing the meat, which are brought one by one by the attendants, and cleared as often as each person had eaten a little. Their fingers serve them for knives and forks; but for liquids, they are obliged to make use of spoons made of wood or horn, silver or gold not being permitted by their religion. The first dish is generally broth or soup; and after that, several plates of mutton cut in small pieces and stewed; sometimes the mutton is roasted along with pigeons or other fowls, which are generally stuffed with a variety of different sorts of herbs. Sometimes they stuff the whole carcase of a lamb with raisins, which is considered by them as a very delicious morsel, although to an European nothing can be more nauseous. Water is the only liquor they drink at table; but as soon as the cloth is removed, coffee is served up to every one who chuses to partake of it: They use so much butter and other ingredients composed of fat, that an European is almost tempted to starve rather than surfeit his stomach by eating of things so disagreeable.

In summer they sup about six, and in winter about five; but in the winter evenings they visit one another at their own houses. In summer their breakfasts usually consist of fruits; and besides their common meals, they frequently eat water-melons, with cucumbers, and several other sorts of fruits.

It is true the common people have not the opportunities of regaling themselves in the manner here described, so that they are obliged to have recourse to the use of the common herbs that grow in their gardens. Their chief meal is in the evening, when they return to their families from the labours of the fields; for what they eat during the rest of the day, is not worth mentioning.

Wine and spirituous liquors are prohibited from being used by the Turks, and indeed all those who use either of them, are looked on as profane and irreligious. But for all that, the number of these people are great, and they drink wine in their gardens

dens and houses with impunity. Nay, they frequently drink to such excess, that they are little better than madmen. This may serve to shew, that whatever pretensions may be made by people to the exterior of religion, yet many of them pay little regard to the practice.

By their religion, they were obliged to wash before they go to prayers, and likewise every time they ease nature; which, considering the state of the country with respect to water, must make it extremely painful. As they are so nasty as to eat always with their fingers, so they are likewise under a necessity of washing after every meal; and those who pride themselves on their cleanliness, wash before they sit down to table. Every time they cohabit with their wives, they must go to the bagnio before they attend prayers in the mosque; and this is of such a sacred nature, that it must not be dispensed with.

Slavery seems to have been the practice of the east from the most early ages; and however repugnant it may appear to our notions of natural justice, yet it is not such a hardship as some are apt to imagine. It is true, that the happiness or misery of a slave depends on the caprice or will of his master, which is undoubtedly a very melancholy circumstance; for wherever, or whenever, the will of man becomes a law, it is natural to look for, nay, even to expect oppression.

Indeed there are two questions concerning slavery, which were stated by one of our great lawyers; and because his brethren were either too idle or too ignorant, he answered them himself.

First, Is slavery, or the depriving a man of his liberty, consistent with natural religion, upon which all human laws are, or at least ought to be founded? To this it is easily answered, That no man in this world has a right to deprive another of his liberty; for this is the act of the community at large, and it can only be done by those who act in a judicative capacity. The man who has transgressed against the laws of society, has no right to those privileges which they convey; and if his crimes have been such as to tend towards corrupting the morals of the people, nothing can be more reasonable than that he should be punished in such a manner as to deter others from acting in the same manner. This is just and equitable; and while we pity the sufferings of the malefactors, we should at least have some compassion for the community at large.

Secondly, Is a state of slavery in the eastern nations a real hardship to those who labour under it? The answer is, It is not, where arts, manufactures and commerce are encouraged and promoted; slavery, or involuntary servitude, are inconsistent with reason and with utility; but in these eastern nations, where property is not secured by an inherent right, where will and power constitute law, the human mind becomes as it were depressed, and sinks under the fatigue of looking for those temporal enjoyments which may be wrested from it in a moment. Slavery or servitude, under such circumstances, is rather a blessing than a curse. Nay, were even the slave to be set at liberty, he could not in those parts procure a subsistence. This will appear evident to every one who will attend to what we have already said concerning this part of the world. For were the common people engaged in the arts of industry, as they are with us, there would be no necessity for servitude; but as things are at present, servitude in these eastern countries is far from being slavish.

There are in Aleppo a few black slaves, who are brought from Ethiopia, by the way of Cairo; but the greatest number of their slaves are white, being either prisoners taken in war, or such as they have purchased from the Georgians. And here we are sorry to observe, that a male here is as much regarded for his beauty, as a female one. Why it should be so, is easily to be accounted for; the people being addicted to unnatural crimes.

When a Turk, or indeed any native of the place

dies, the women immediately set up the howl, which they continue till the body is buried. Having washed the corpse, they stop all the natural passages with cotton, to prevent any moisture from coming out, which in that case would render the whole unclean. They then wrap up the body in a large piece of cotton cloth, and lay it in a coffin. If the deceased is a male, the head-dress is laid at his head, in great order; but if a female, it is placed over the breast, inclosed in a handkerchief.

The coffin being closed up, the clothes of the deceased are laid upon it, and the procession to the place of interment is conducted in the following manner; but this is peculiar only to persons of quality, though in many things the poor do all they can to resemble them.

The processions begin with a number of banners being carried before the corpse, and next follow the male relations. These are followed by the corpse, the head being carried foremost, contrary to the practice of most other countries in the world. The bearers are relieved often, it being considered as meritorious in every person who attends the funeral, to lend his assistance in conducting the corpse to the grave. The women close the procession with doleful cries and lamentations, while the men continue singing different passages out of the Alcoran.

In this manner they proceed to the mosque, where the bier is set down in the court yard, and several prayers repeated by the iman, or priest; after which it is carried on in the same manner as before, till it comes to the burying-place, of which there is but one within the city, appropriated for people of rank; all the others being at a considerable distance, and common to the poorest persons whatever.

The graves lie from east to west, and are lined with stone, a practice that seems to have taken place time immemorial among the antient heathens; and it is well known that not only Mahometans, but even Christians, retain to this day some heathenish practices. When the corpse is taken out of the bier, it is put in a posture between sitting and lying, with the head to the westward, so that the same may be seen towards Mecca, and a small portion of earth being put round the body of the grave, it is filled up with small stones, which are laid across, and prevent the earth from falling in. The iman, or priest, throws on the first handful of earth, and a prayer is said for the repose of the soul of the deceased. The survivors are exhorted to attend to their duty in the same manner as is practised by divines in Britain, when they preach funeral sermons; and the last words the priest, or iman, uses, are, "May God be merciful to the deceased!" This being done, the grave is filled up, and stones are erected both at the head and feet, containing a character of the deceased, and such other things relating to him as are consistent with our more than fulsome encomiums over the graves here.

Some have the figure of a turban cut upon the upper head-stone, if the deceased is a man; and if a woman, the figure of her head-dress. As they never open their graves in less than seven years, so it requires a large space of ground round the city to contain the bodies of the dead. But even these burying grounds are so decent, that Europeans ought to copy the example of people whom they too frequently look upon with contempt. For a considerable time after the funeral, both the men and women go to pray at the graves of the deceased; but they wear no sort of mourning, for they consider their deceased relations in a state of happiness.

This notion is not new; nor could any objection arise against it, were it not that Christians themselves forget the duty they owe to God, and imagine that he is unjust when he deprives them of their dearest relations. This should be attended to by all those who read history, and the author begs it may never be forgotten.

With respect to the externals of religion, the Turks are the most exact people in the world; but they

know little of fundamentals. They are, however, charitable to the poor, and hospitable to strangers, which, in two points at least, constitute a considerable part of true religion. All those who pretend to be the descendants either of Mahomet, or any of his relations, are distinguished by a green sash, which they wear round their waists; but many of these are no better than impostors.

It is necessary, after having said so much concerning the Turkish manners and customs that we should describe in what manner the Christians live at Aleppo; who are of different denominations, as we have mentioned before.

The Christians generally eat in the same manner as the Turks; except that the former use oil, and the latter use butter. The Christians have one favourite dish, which they call *burgle*; and which is no more than boiled wheat, first ground in a mill till separated from the husk, and then made up into balls for common use, it being always eaten along with sweetmeats.

They are very rigorous in their fasts; and an Armenian carries his superstition so far, that he would lose his life sooner than eat on one of those days. The Christian women are always veiled, but in a different manner from the Turks. They seldom go abroad, except to their church, the bagnio, or to visit a near relation. Some of them are permitted to visit the public places of entertainment; but in general they are kept under very close restraint.

The parents contract their children to each other while very young; but although there are here a great many denominations of Christians, yet in their marriage-ceremonies there is little or no difference: so that, in giving a description of a Maronite wedding, we give a description of the rest.

After the bride has been demanded in form, the relations of the bridegroom are invited to an entertainment at the house of the bride's father, in order to fix on the day for the celebration of the nuptials; which generally takes place within a fortnight afterwards. In the afternoon of that day they go again to the bride's house, where they are entertained, and then return to the house of the bridegroom, who hitherto has not made his appearance; for it is the custom of the country for him to hide himself till the people discover him by search. At length he is brought out dressed in his worst cloaths, amidst great noise and merriment, and then he is led into a room where he dresses himself.

A little after midnight, all those invited to the wedding, preceded by a band of music, return once more to the bride's house; each carrying a lighted candle in his hand. When they arrive at the door, they demand the bride, and are, at first, refused admittance. Upon this a mock fight ensues, wherein the assailants are sure to prevail; and then the women proceed to the bride's chamber, whom they lead out veiled. In the same manner they lead her to the house of the bridegroom, accompanied by two of her nearest relations, but not more; and these must be females. She is then set down at the upper end of the room, among the women, still keeping on her veil; nor must she speak to any person whatever; but she is at liberty to rise up, and compliment, in dumb shew, every one who comes into the room.

The remainder of the night is spent by each sex in different apartments; and about nine the next morning the bishop, or priest, comes to perform the ceremony. Before he enters the women's apartment, they all put on their veils; and the bride is supported by two women, together with the bride-maids, who keep their veils properly adjusted.

The bridegroom then enters the room, dressed to the best advantage, and takes his seat on the left hand of the bride, with his bride-men along with him. After repeating a few prayers, the priest puts a crown first on the bridegroom's head, and then with the same solemnity crowns the bride. He then repeats a few more prayers, and puts a ring on the bridegroom's finger, with another on the bride's. Towards the conclusion of the service, he ties a piece of tape round the neck of the bridegroom, which remains till the af-

ternoon, when another priest comes to take it off. This is the concluding part of the ceremony; and then all the men withdraw to their proper apartments, in order to regale themselves with coffee along with the priest, who generally retires soon after they have dined, leaving them to their own conversation.

The priest is scarcely gone from the house when their riot begins; for while he is present, they maintain some sort of decorum. Great quantities of victuals are destroyed; and several tables covered both for dinner and supper; and there is usually a large profusion of tobacco and coffee. About eleven at night the bridegroom is led in procession to the bride's chamber, where he presents her with a cup of wine, of which she drinks to him, and he returns the compliment. After this he is carried back again with the same ceremony; the music playing during the whole of the procession; and all those who are acquainted with the bridegroom attend till supper is over, and then they retire, leaving with him only a few select friends. At midnight he retires to the bride's chamber, after a fatiguing load of ridiculous ceremonies, but such as seem to have been peculiar to the Asiatic nations from the most early ages of time. For several days after the marriage, flowers are sent to the bride by all her female acquaintances; but no person is permitted to visit the new married couple till the end of one week after the consummation of the nuptials.

On the eighth day after the nuptials, the bride's relations are permitted to visit her; and an elegant entertainment is prepared for them, according to the custom of the country. It is reckoned indecent for any woman to speak to company till at least one month after her marriage, except to her husband; and even then she must be much on the reserve. An old woman, like a Spanish duenna, generally gives them instructions on that head; and these old women are employed as spies on their conduct. The Maronites are strict in prescribing rules for the conduct of their wives; and yet they might save themselves that trouble, for the women in this part of the world are as artful as in any other; and do not only make assignations with their lovers, but even meet them on equal terms. It is proper to observe, that the laying unnecessary restraints upon the female sex is never attended with any beneficial consequences. Shut nature out at the door, and she will come in at the window; and if women be laid under unnecessary restraints, they will find a way to break their chains, and regain that native freedom which they have a right to as human beings.

All Christians who die here are carried to the grave on biers, and they have mass said for the repose of their souls. They likewise, on particular days, send provisions to the poor, as a hire for them to pray for the dead; and these mournings continue one year; after which they have a grand entertainment, when all grief is forgotten.

The synagogue of the Jews lies within the city, in a certain district, where they all reside. Some of their houses are built upon the walls of the city, and the ditch being there turned into gardens makes the situation agreeable. Such of the Jews as are of a superior rank in life, have fine court-yards to their houses; but they are, in general, so nasty, that their dwellings are unhealthy. As most of their time, during their festivals, is spent in religious duties, so they cannot dress victuals; and it is not lawful for them to eat any meat cooked according to the Christian fashion. They seldom indulge themselves in any sort of excesses; and indeed they may be considered, in some respects, as the most abstemious people in Aleppo. Wherever the Jews are, they still labour under some sorts of hardships; but not so much in Turkey as in those countries where the Roman Catholic religion is professed in Europe.

Though it is agreed, for the benefit of poor Jews, that meat shall be sold under market price, and the deficiencies made good out of the public stock, and though this rule is in some measure attended to, and the managers do their duty; yet the Turks are so rigorous towards them, as greatly to hinder the observance of it.

Engraved for Moore's New & Complete Collection of Voyages & Travels.

HABITS and CHARACTER of the PEOPLE in PERSIA, with the manner of SMOKING, &c. as practised in that COUNTRY.

All the Europeans residing here are called Franks, but most of them are either English or French. All these, except the chaplains, are merchants, who carry on a considerable trade in many different articles of commerce. Many of those merchants marry women in this country, but we find few instances of their bringing them to England, nor indeed to any part of Europe. They leave however a spurious breed behind them, and we may very naturally believe that little regard is paid to their education.

There are three convents here of the Roman Catholic religion, and all these are under the protection of the French king.

The Dutch have a consul here; but they have no factory; so that all he can do, is, to protect their merchants from insults, when they come from other parts of the Levant.

The greatest part of the Europeans live in *kanes* or *caravansaries* in the principal quarters of the city. The ground floor serves for a warehouse, and the upper story for their dwellings. The building is crowned with a sort of colonnade, having several chambers underneath; for as those merchants are seldom married, so they live in a sort of recluse state.

It was formerly customary for all, or at least most of them, to wear the Turkish habit, retaining only the hat and wig, by way of distinction; but of late years the greatest part retain the European fashion. The French and Italians, agreeable to their volatile notions, conform as far as they can to the manners and customs of the Turks; but they are much more moderate in their drink, which is either white wine, or the red wine of that province.

The gentlemen of the English factory drink for the most part weak punch, and they find it very refreshing. Many other Christians, and even some of the Turks themselves, have in this particular copied their example; and, consistent with the European custom, they often ride out on horseback. Though the natives, from the character here given of them, may not appear in the most amiable light, yet they seldom give the Europeans any cause to complain. Their intercourse with the Porte hinders them from feeling the tyranny of government, and their consuls are in general treated with very great politeness. Every European may venture as far as he pleases from the city, but he must take care that none of the wandering Arabs come to assault him.

The last thing we shall take notice of, relating to these people, is the plague; and to this we may add the venereal disease. It has been generally imagined, that the venereal disease was brought into Europe from South America: perhaps we are able to overthrow this sentiment.

Whatever our historians may have written concerning the venereal disease, is not our business to enquire into at present; but so far as we are able to form a rational conjecture, it came from Asia, and possibly its origin may be owing to polygamy. The promiscuous use of women must, at all events weaken the human frame, and sow the seeds of those disorders which generally end in temporal ruin. Its raging in Europe soon after the discovery of the vast continent of America, is no proof that it did not formerly exist in Asia. Nay, it is rather a proof that it did; for as the generality of writers are of opinion that America was peopled from Africa, consequently we may naturally conclude, that Africa was peopled from Asia, and here was an equal interchange of manners and customs.

It is certain, that the people of Aleppo are frequently afflicted with the venereal disease; and yet it seldom happens that it is attended with any bad consequences. It is true, that many of them labour under it great part of their lives, and some of them are never radically cured; the reason is obvious. The warmth of the climate, and the frequent use of the *bagnio*, keeps this disorder under; and although it is never removed, yet the patient seldom feels much

pain. Some of our physicians, as well as myself, attempted to teach the natives how to eradicate this disorder; but we found them so superstitious, that they would not pay any regard to what we told them. Upon the whole, we are of opinion that this horrid disorder arises from an inordinate connection with the female sex; and that although some people have been vain enough to imagine that it came first from South America, yet upon enquiry, perhaps, it will be found that it has raged in Asia time immemorial; although altogether unknown to the people who live in the cold northern climates of Europe; or indeed in any cold countries at all.

The air of Aleppo is very bad for such as are phthisical; and here are many epidemical distempers, which prove fatal to the natives, but are not so dangerous to Europeans. The plague visits them once at least every ten or twelve years; but first makes its appearance in some town in Syria. It rages most feverently in June, but decreases towards the middle of July, and disappears totally in August; so that one may naturally conclude, that a continuation of hot weather is an enemy to its power. Well may this most dreadful distemper be named the plague; for human nature cannot be liable to any thing worse. The surrounding scenes of death and misery that accompany it, are shocking to reflection. The terrible distresses of the people are inconceivable; heat, thirst, languor, dejection of spirits; and the most excruciating pains, frequently unite to torture the patients; whose miseries are still more increased by the want of medical assistance, a desertion of friends and attendants, and the loathsome putrid ulcers which remain upon those who are even happy enough to survive.

There are no fixed symptoms by which the plague can be discovered; for it shews itself under such a variety of forms, that it may well be called a Proteus. The most flattering appearance of it ends in sudden death; and when no hopes are left, it frequently happens that the patient is surprised to find himself perfectly recovered. A violent fever, great internal heat, and the skin dry and hot, are symptoms that often accompany this fatal disorder. The eyes of the patient lose their lustre; the speech fails; the countenance appears confused, and frequently changes to a scarlet colour; the pulse varies prodigiously, but so as not at all to be depended on.

There are certain buboes rise upon the patient, that sometimes come to a head, and sometimes do not. The fever has been known to go off by a sweat. To avoid the malignant effects of this dreadful disorder, people shut themselves up at home, having their provisions conveyed to them through a window. The impatience arising from confinement; the fear of the contagion breaking out; the shouting of the women for the dead, both day and night; and the singing before the corpse when going to be interred, all unite to render the situation both solemn and disagreeable. Such is the account given by Dr. Russell, who resided lately in those parts; and who, being a man of learning, took every opportunity to procure the best information.

We shall proceed to finish this article with an account of Persia, by Sir Thomas Herbert and others. "Having visited several parts of Africa, and travelled thro' the whole of the Mogul empire, we arrived (says Sir Thomas) at Gambroon, called by the Romans Bander, meaning a port town, because it is the best port belonging to that empire. It is situated on a level near the sea, having no hills; nor any rising grounds within fifteen miles of it. It stands in the province of Caramania; and before the fall of Ormuz, was a small town; but since it has increased so fast in buildings and inhabitants, that for grandeur it may be ranked with the best towns in Persia, being frequented by merchants from all parts. It is become a city of great commerce for raw silk, carpets, lacquer, and other commodities brought hither by land, and all sorts of merchandise by sea.

The buildings are, for the most part, of brick, baked

baked in the sun; which will so harden them, that they appear as hard and lasting as if they had been burnt. They are built low, and most of them with small courts and balconies; with terraces on the top, where they sleep in cooler weather upon carpets.

In summer the air is so hot, that the inhabitants are obliged to remove to some of the neighbouring villages, for the benefit of cool streams and shades. Their summer lasts nine months, and during that time it is rare to see a cloud in the sky. Nay, it is so intolerably hot, that some, who remain in the town, lie naked in troughs of water to cool themselves; but this often proves fatal to them, because they are apt to catch cold. The drink that is used here, as the most cooling, is therbet, consisting of water mixed with the juice of lemons and rose-water. They have plenty of fruits, but most of them are imported; such as oranges, lemons, pomegranates; pomecitrons; figs, dates, currans, myrobalans, apricots, almonds, pistachos, apples, pears, quinces, sugar, and, indeed, every article of luxury that can be imagined; for the people of the east are much more addicted to things of an effeminate nature than the Europeans.

At the north and south ends of the town are two castles, on each of which were formerly eighty pieces of brass ordnance, but ever since the wars in Kouli Kan's time they have been much neglected. There are no walls round the towns; the streets are narrow; the mosques and Jewish synagogues very mean structures; and the place is badly supplied with water. They have great numbers of camels, mules, and fine Persian horses; but in the night the town is infested by swarms of jackals, who come in troops, making a most hideous noise. The inhabitants hunt them with lances, swords, and dogs; but they never get them totally subdued.

When the merchants flock to this city for trade, which is in the months of November, December, and January; here are great numbers of women, comely in their persons and dresses, having their hair neatly plaited, with rings in their ears; but they are lewd and intolerably impudent. Great numbers of Banians resort hither to trade; but they are so unsociable, that few chuse to converse with them.

About three miles from Gambroon is a tree called the Banian tree; which spreads two hundred paces, and will afford cover for some hundreds of men without crowding. It is adorned with ribbands and streamers of taffara, of divers colours; and within it is a pagod, with three images in it of grim visages, and deformed shapes, representing those imaginary deities whom the Banians worship.

We remained forty days at Gambroon, and then set out in the caravan belonging to the English ambassador, Sir Dudmore Cotton. In one day we arrived at Baird-Ally, a town 16 miles from Gambroon, where we found several good caravansaries, or inns, built by some charitable Turks for the use of travellers. At the gates of some of them are sutlers tents, or Turkish cooks-shops, where provisions are sold; and there are cisterns containing fresh water. Lar, the next place we arrived at, is about three days journey from the Persian Gulph; and it gives name to a province about three hundred miles across. For the Persians reckon by what they call pharsangs, which are three miles each, and much the same as the French league.

The city of Lar is in the middle of the province, and seems to have been of great antiquity. It is seven days journey from Gambroon, and about twenty from Babylon. It has all the appearance of antient grandeur; but at present looks like a person advancing in years, and sinking under a load of infirmities. The water is not good; but they have some fine gardens, where they regale and solace themselves during the hot seasons. In short, it may be said of it, in the words of the poet, as applied to Mr. Waller:

Her setting sun still shoots a glimmering ray,
Like antient Rome, majestic in decay.

This part of the country is much subject to earthquakes; and sometimes they are so dreadful, that

thousands of people lose their lives at once. There is a strong castle here, which commands the whole town, and appears formidable to an enemy. It is built of stone, and the walls are well furnished with platforms and bastions, on which are mounted several pieces of brass cannon. There are many mosques in this town; for the Turks are very strict in attending on the exterior parts of religion; and most of these are adorned in the inside with passages out of the alcoran in the Arabic.

The whole adjoining country is, in general, barren; and yet it affords a considerable number of dates, with several other fruits, and many different flowers. Here are also goats, hares, rice, barley, and many other things; but their water is so extremely bad, that nothing less than necessity could induce the people to use it. It frequently breeds worms in their legs; and indeed this is the case with the waters in many parts of the East Indies, as has already been taken notice of in the course of this work. In order to kill these vermin, which become very offensive, they prepare a sort of ointment made of the juice of a tree, but it seldom removes them entirely.

The inhabitants are a mixture of Jews and Mahometans, and most of them have very disagreeable countenances. Their habit is a wreath of calico tied round their heads, a plaid of divers colours, and sandals on their feet; the rest of their body being naked. Some of them, indeed, wear gold chains, but these are only the great officers of state; who likewise, as an additional ornament, have gold rings in their ears, in their noses, and along with these a variety of additional ornaments.

From Lar we travelled northward about sixty English miles, over a most beautiful country, and came to a town called Jaaroun, inhabited chiefly by Jews, of which there were upwards of one thousand families. We have great reason to believe that this is the Kirjath-jearim mentioned in Nehemiah, chap. vii. ver. 29: from whence some of the Jews returned to build the temple of Jerusalem, in virtue of the edict of the emperor Cyrus the Great. Indeed, the more we attend to the descriptive-part of Persia, the constant affinity of names, together with a variety of other circumstances, the more we shall be confirmed in the belief of the truth of what is related in the sacred scriptures of the Old Testament, concerning the captivity of the children of Israel.

Susa, or Shushan, the palace of the antient Syrian kings, stood near this place, and it seems to have been in repute so late as the time of Alexander the Great. For we are told by Quintus Curtius, that Alexander sacrificed here, and then endeavoured to lead his army over the hills to Persepolis; but being attacked and beaten by Ariobarzanes, he was obliged to retreat, and find out another way; which could not be done without much difficulty, the road being in a manner impassable.

In vain did we look for the antient palace of the Persian emperors where Cyrus flourished, and where the prophet Daniel was esteemed and caressed. All had given way to time, and the ravages of lawless power. Indeed, we could not meet with any curiosity worthy of notice, which induced us to leave the place as soon as we could procure us a guide to conduct us a little further. We travelled three days over a fine country, which, upon our entrance into it, seemed to be burnt up with the sun; but the rain fell in such immoderate quantities, that every brook was swelled into a river; and our journey was for some time impeded on account of the roads being impassable. Rain falls but seldom here, and when it does, it comes with such a deluge, as to sweep away every thing before it. Cattle, men, houses, and even whole caravans, are not able to resist its fury.

Having spent three days in this disagreeable situation, we arrived on the fourth at Zochlea, or Diackow, where we saw many tombs, with Arabic inscriptions upon them. The alcoran commands, that no dead bodies be buried within cities, lest they should spread

spread an infection; but however rational this practice may appear, yet it is not strictly adhered to.

About a mile from the city is a pleasant grove, in which there are several Turkish convents for women, who live in an humble retired manner, working for a subsistence; and giving all the overplus of their labour to support the poor. Berry; a little village through which we passed; consists only of a few houses; but it was formerly a place of great repute. Here the Persians have a college for the education of youth, but it contains nothing remarkable; nor is their plan of public education calculated to improve the rational faculties.

From Berry we travelled to Bannaroes, where we were entertained with feasting and music, and then passed to Goyvone, a place consisting of about five hundred houses; and here a prince, of the name of Mahomet, lies buried; but no relation to the impostor of that name. From hence we travelled over a most barren desert wilderness, inhabited only by ostriches, storks, and pelicans, till we came to Mochake, where we saw the tombs of three very celebrated Mahometan doctors, who, as the people told us, have laid buried there upwards of four hundred years. These tombs are resorted to by vast numbers of devotees from every part of Persia; for although the Mahometans do not worship images; yet they are very superstitious.

Next day we arrived at Coughton, where we staid one night, and then continued our journey to Sheraz. This city is one of the most pleasant in all Asia; and, probably, derives its name from Sheraba, which, in the Persian language, signifies a grape, of which vast quantities grow here; and, in general, they are of the best sort. The city is watered by Kur, a river which rising in the Zopirian mountains, after a course of two hundred miles, mixes itself with Tab and Ulay, and then falls into the Indian ocean.

The whole city is about seven miles in circumference, secured by walls built at the sole expence of Ushan Cassan, a famous Armenian prince, in the year 1470. It is situated in a spacious plain, of about twenty miles square, which being surrounded by hills at a distance, gives it a most agreeable appearance. There are vast numbers of vineyards and gardens, all beautifully laid out, according to the taste of the eastern nations; and the cupolas on the roofs of the mosques have something in them, when the sun shines, that ravishes the eye of the beholder. Here are many traditional stories told concerning this place, which, probably, may have some foundation in truth; but we shall only mention a few of them. It is said that magic was first invented here, which is not in the least improbable; for it is still in high repute in this country. Here was the palace of Nimrod, and here Cyrus was born and entombed. From this place they told us the wise men came, who worshipped Christ at Jerusalem, but were directed by the star to Bethlehem. Here are many other stories concerning this place; but we could not see any antiquities to give countenance to these traditions; and yet we have not the least doubt but they come very near the truth in locality, because it must have been near this place where some of those things happened. The houses here, as in every other part of Persia, are built of bricks dried in the sun, yet so hard, that the rain, or any other sort of weather, has no effect upon them. The most ornamental part of their furniture consists of carpets; but all of their houses have gardens behind them. The people, however, are indolent; industry is neglected; and the men sink down into such a state of effeminacy as is in all respects disgraceful, and indeed degrading, to those who are endowed and adorned with rational faculties.

They have no less than fifteen mosques here, many of which are finely adorned with cupolas and spires. The steeples of two of them, of which one is square, and the other round, rise into a prodigious magnitude, and are adorned on the top with gold and blue. Most of these mosques are considered as venerable, because there are in them many of the tombs of their doctors, which are so adorned, as if nature had been ransacked, and art exhausted, to furnish out the ornaments.

They have likewise a college here, where lessons are read on several of the sciences; such as astronomy and natural history, with logic, according to the notions they have formed of that abstruse science. Their gardens have something in them very luxurious, and in all respects suited to the effeminacy of the east. They are endowed, as it were, with all that nature can furnish out; and although they have not the art of improving them in a proper manner, yet these gardens are not without beauties. It is really amazing to think what variety of fruits they have here, and to enumerate them all would be too tedious indeed. But the indulgence of Providence is such, that the wants of all human nature are supplied, consistent with the dictates of unerring wisdom.

The most usual pastime here is swinging upon ropes, stretched from one tree to another; especially during the times of their grand festivals. They have little or no water, but this is owing to the lazy, indolent habit of the people; for there is a fine river very near them, and from it they might convey streams of fresh water to the city; but they neglect every thing by which their own interest could be promoted. They are, in general, such slaves to voluptuousness, that they spend the whole summer in such an effeminate manner, that they sink their characters even lower than those of the beasts that perish. Chastity is not regarded while pleasure takes its range; and the rational faculties being intoxicated with dissipation, all duty is forgotten.

From Shyrax we travelled to Persepolis, about thirty miles more to the north-east, over a very barren and sandy country. About the middle we crossed a good stone bridge over the river Cyrus, near which Elamis stood, which was once the capital of the world, when the Persian empire was in its glory, under Cyrus the Great. Quintus Curtius gives us a description at large of this city; but all its grandeur is now humbled into dust. He says, the buildings were very stately and beautiful, and that it was the most costly city in the world. All the houses were built of cedar or cypress wood; but its greatest ornament was the palace of the Persian monarchs, which, for its situation, prospect, rich materials, and curious workmanship, was, in a manner, incomparable. It was built at the east end of a spacious vale, upon a rock four hundred paces from the city; and its platform contained at least fifty acres of ground. The walls were adorned with a variety of figures of men, beasts, and fishes, carved according to the taste of that age. Towards the east was a high and stately tower, encompassed with a triple wall of well-polished marble, with battlements on the top, from whence the king could have a most delightful prospect of the city. Adjoining to it is a mountain, on which was a stately mausoleum, or burying-place for the Persian kings; but no remains of it are now left. However, we could discern it was the place where this once famous city stood. It was taken by Alexander the Great, about three hundred and thirty years before the birth of Christ; and the walls having been thrown down, it gradually sunk into decay. Thus the glory of the world passes away; for as ambition varies, cities and empires rise, so vice and effeminacy brings them to destruction.

Although the whole of the palace is demolished, yet there are still some remains of temples adjoining to it, wherein are several altars and idols; but as the people are Mahometans, they are at present but little regarded. There are however some idolaters here, many of whom are very gross in their practices, and frequently much more so in their morals.

About a mile from the city is a village called Murdash; where there are about two hundred houses; and the people are so superstitious, that if any Christians come among them, they sit ashes on the earth where they tread; imagining every thing they touch is polluted. Nothing in the world can be more pleasant than this neighbourhood; for all the villages are watered with delightful streams, and the gardens abound with fruits, herbs, and flowers, in their particular seasons. About three miles to the northward, at the

bottom of a mountain is the figure of a giant cut out of a solid rock; and concerning which, there are many traditional stories. They in general imagine that he is a person who lived about the time of Ahasuerus, when that monarch espoused the beautiful Esther; and if so, it may have been carved in memory of the celebrated Mordecai, who prevented the destruction of his countrymen.

Near him are the figures of several young women, which probably may have a reference to the beautiful account we have of Esther in the bible. This part of the country is so romantick, that every place presented us with new curiosities.

Not far from this place we came to a mountain, where we saw the figures of two giants on horseback, surveying each other, and contending for a ring upon which each of them lay their hands. This symbol probably points out the mighty contest for the empire of this world between Darius and Alexander, or between Cyrus and Artaxerxes. Near to these are several other images; but most of them are greatly defaced. This was once a very considerable place, and if we might hazard a conjecture, we would imagine that this place was of old within the garden of the palace.

The next place we visited was Magowan, a small town, but most delightfully situated, having plenty of wood and fresh water, with all the other necessaries of life. Here, according to tradition, Ishmael, the son of Abraham, was buried, and they shew us a tomb which they told us was his sepulchre; but no regard should be paid to what is not supported by the evidence of history.

Continuing our journey, we arrived at a stupendous mountain of solid black marble; but it is so little regarded, that they use it for pavements. There are still several Greek and Armenian christians here, and likewise some Jews who probably have continued from one generation to another ever since the Babylonish captivity. And what is still more remarkable, these Jews are all more or less employed in commerce.

Over craggy and steep hills we came to Tartang, a small town, but remarkable for several Mahometan antiquities, such as tombs and curious mosques.

From this place we travelled through a great number of villages, most of which were extremely beautiful, well watered, and adorned with delightful gardens. We that night were lodged at a town called Yzdefaz, pleasantly situated in a narrow valley, and the next day we arrived at Ammabaut, a small village mostly inhabited by Georgians. Here are several good inns or caravancies, with banquetting houses and pleasant gardens.

The next place we visited was Caumaxa, where the famous battle was fought between Cyrus and his brother Artaxerxes, which decided for some time the fate of the Persian empire.

Here are several remains of the ancient Persian grandeur, probably first erected about the time of Cyrus the Great, and there seems to have been Pagan temples. The soil here is in many places sandy and barren, but it is not always so, there being other places where fruits spring up in great plenty. From the tops of the mountains there are perhaps the most extensive prospects in the world. Thus a spectator can sometimes in one instant view both the Caspian and the Euxine seas, together with all the intermediate space between both.

The most romantic of all these parts of Persia were antiently called by the name of the inhabitants Gordians, but their people are now called Georgians. They are a sort of Greek christians, but have many heathenish rights and ceremonies, together with some of a Jewish original. They sprung originally from those hereticks called Nestorians, who denied the divinity of Christ and of the Holy Ghost; and so attached were they to the system they had embraced, that we are told, no less than twenty thousand of them suffered martyrdom about the latter end of the fifth century, which is not at all improbable.

At last we arrived at Ispahan, the capital of the empire; situated in the Parthian province, and often mentioned by antient authors. It is in compass about nine miles, containing something above seven thousand houses; with about two hundred thousand inhabitants; and besides these, there were formerly in times of peace many merchants from most parts of the known world; but ever since this once famous kingdom or empire has been torn in pieces by intestine wars, trade has been on the decline. The situation of Ispahan is as pleasant as can be imagined, and the air is pure, cool, and healthy. The soil around it is fertile, being watered by the Sindery, a fine river, over which is a bridge of thirty-five arches. This river never reaches the sea; for after it has watered the neighbouring country all round Ispahan, it is swallowed up in the sandy deserts. All the houses are built of brick, dried in the sun; but they are as hard as if they had been burnt. All the shops have terraces over them adorned with blue plaister, and these being mostly in the great square, have a very splendid appearance when the sun shines on them.

Near the great square is the palace of the antient sopher's or emperors, having delightful gardens within it. The whole front is painted with blue and gold, embellished with verses of Arabian poetry, according to the custom of the country; for the people in general can speak the Arabian language. Within, the rooms are arched and enlightened by letters, embossed above, and painted with red, white, and blue. The houses are spread with carpets; and the gardens are filled with all sorts of aromatic herbs, and the most delicious fruits, flowers, &c.

Opposite to the palace is a fine temple, built round, and within distinguished by isles. The outside is stone, and the inside paved with polished marble. As this temple is not built in the Mahometan fashion, we may reasonably conclude that it was built long before the time when that impostor lived. The seraglio is said to be filled with beauties; but none but eunuchs are permitted to visit them. The Persians were always an effeminate people; and if so in antient times, there can be no doubt of their being so now, for the Mahometan religion does not give much encouragement to industry.

There is a strong castle here, which seems to have been built during the wars between the Romans and Parthians, for it has all the marks of high antiquity. There are many Jews here, having a large synagogue; and most of these are engaged in trade. The Armenians are likewise numerous, and there are some popish monks of different orders; upon the whole, this city has been once very magnificent; but having suffered much by the wars, it is beginning to fall to decay.

From Ispahan we travelled about four hundred miles to Astraraff, but the weather was so intolerably hot, we were obliged to sleep in the day, and continue our journey in the night. In this part of our journey, we saw several of those people called Nomades, or wandering herdsmen, who have no fixed situation, but drive their flocks from place to place, like the patriarchs of old. We next passed through the valley of Mount Taurus, which is eight miles in length, but not above six yards in breadth. In the reign of Albas, a thief, with two hundred horse, took possession of this pass, and for some time kept possession of it against all the Persian power.

At length an Armenian engaged the thief in single combat, and killed him, after which his followers were easily dispersed. But Albas, who ought to have rewarded the Armenian, became jealous of his glory, and ordered him to be privately assassinated.

From hence we travelled through many delightful villages, till we came to Perisow, where there was a royal summer-house, surrounded by fine gardens. This town stands in the antient province of Parthia, situated on the brow of a hill, from whence is an extensive prospect. Being much fatigued, we rested here two days, and then continued our journey over a
fine

Royce sculp

fine country to Gheer, where we saw such swarms of frogs, as made our abode for only one night very disagreeable. Twenty-one miles further brought us to Alcavar, a very convenient place, where we found good accommodation; and next day we arrived at Necaw, where there is another royal summer-house; but it had not any thing remarkable, only that there were vast numbers of pheasants, of beautiful shapes, and different colours.

The next night we arrived at the borders of the Caspian sea, where the emperor was taking the diversion of hunting. Here is another city, of the name of Asharaff; and in it our ambassador, with his whole train, were nobly entertained. This city is built on a low ground, near the banks of the Caspian sea, and is but a mean place; having no fresh water but what is brought in a canal from Mount Taurus. There are about two thousand families in the town; but none of the houses are remarkable, except the palace, which is divided into four courts, and on the top is a cupola, from whence there is a most charming prospect of the Caspian sea and Mount Taurus, at a considerable distance. The chambers of the palace are large and arched; the ceilings are all painted blue and gold, and the floors are spread over with fine Persian carpets.

This city lies in the Hyrcania of the antients; but the province is now called Mozendram. In antient times it abounded so much with wood, that it was called Sylva Hyrcania, and was famous for vast numbers of buffaloes, and many other animals peculiar to that part of the world.

The Zopiri, who inhabited this country of old, had a strange custom, viz. that when once their wives had borne three or four children, they lent them to such of their neighbours as had no children, that they might become happy fathers; and the women readily consented. There are prodigious numbers of mulberry trees in the gardens and woods; and it is on these the silk-worms breed. These worms were brought first into Persia from India, and they produce a vast revenue annually.

Leaving this place we travelled to Terrabaut, on the south-east of the Caspian sea, built in a rich soil, abounding with fine gardens, all pleasantly watered by small streams that empty themselves into the sea. The houses are built in a different taste from any we saw in Persia before; for instead of flat roofs, they are sharp and pointed as in England. The streets are broad, but not regular; and there are about three thousand inhabi-

tants. The royal palace is at the north end of the town; is very spacious, and finely finished; having a most delightful prospect of the Caspian sea, and a vast number of small islands.

The Caspian sea, which lies near this city, is deservedly reckoned one of the wonders of the world: in greatness, taste, and colour, it resembles the ocean; but has this wonder peculiar to itself, that although many great rivers empty themselves into it, and have no visible vent, yet it never overflows its banks. It is three thousand miles in circumference, and the shape is nearly oval; it is shallow towards the shore, and full of quicksands; but further off from land it is unfathomable. It is bounded on the east by Nega-has, on the south by Hyrcania, on the north by part of Tartary, and on the west by Media and Armenia.

It has many lofty mountains adjoining to it; and there is a great trade carried on with the merchants of Astracan. Many have been of opinion, that it has a secret communication with the Euxine sea; which if so, must be underground; but this is only conjecture. The Tartars who reside near the Caspian sea are extremely fierce; and although they follow the Russian armies, yet it is more for the sake of plunder than that of being subjects: for, like the wild Arabs, they may properly be called an unconquerable people.

There is not, perhaps, in the world a more fertile country than Persia; but the abuse of its fertility has often proved fatal to it. It was totally subdued by Alexander the Great, and frequently subject to the Romans. During these last thirty years the unhappy natives have experienced all the miseries of a civil war; having no fixed form of government; being sometimes subject to one usurper, and sometimes to another. This has much injured its trade; and is of no small loss to the European nations, particularly to the English. Media, adjoining to the Caspian sea, is famous for being the place where vast numbers of the Jews resided during the captivity. It is a fine country; but we shall not enlarge on it at present, having given an account of most parts of it in the preceding part of this work.

Bagdat is generally supposed to have been built out of the ruins of the antient Babylon; but upon viewing it we found, that it did not answer to the situation of that once famous city, of which we have so many fine descriptions both in sacred and profane history; and, so far as appears, it was about thirty miles distant from this place.

TRAVELS THROUGH AFRICA.

AFRICA, one of the divisions of the world, is called by the Arabians Iphrithia, either from the word Faraca, which signifies to divide; or rather from Iphricas, a prince of Arabia-Felix, who being dispossessed of his own country by the king of Assyria, crossed the Nile, and led his troops as far as Carthage; for which reason some of the antient geographers took that part for the whole.

As to its antient bounds, it was reckoned to have some rivers springing from a lake in the deserts of Gango on the south, the Nile on the east, and was divided into four parts; namely, Barbary, Numidia, Lydia, and Negro-Land.

Barbary extends from Mount Atlas to the Straights of Gibraltar; and passing along the coast of the Mediterranean sea to Mount Meies, about three hundred miles from Alexandria, is bordered on the south by that part of Mount Atlas which faces the sea. This

country is the best part of Africa; its inhabitants are brown and tawny; but in general they are a civil and well governed people.

It is divided into four kingdoms, namely, Morocco, Fez, Teulerin, or Tremizen, and Tunis. The first of these kingdoms is divided into seven provinces; the second into seven more; the third into three; and the fourth into four.

The second division of Africa was called by the Latins Numidia; and by the Arabians Beledulgerid, or the Land of Dates; as being the land of Africa that produces most of that fruit. It is bordered on the east by the city and territories of Elvac, at about one hundred miles distant from Egypt. On the west it has Non; on the north part, Mount Atlas; and on the south, the sandy deserts of Lybia. This is reckoned the worst part of Africa, by reason of its burning sands; and the towns being situated at great distances from each other,

particularly Tefset; which contains only about four hundred families, and is three hundred miles distant from any other people.

The third part of Africa was called by the Latins Lybia, and by the Arabians Jerra, which signifies a desert. Its bounds are the ocean on the west; Numidia on the north; the Nile on the east; and Negro-Land on the south.

It is inhabited by many tribes of barbarous people; but has seldom been visited by travellers till the present age, when several gentlemen, whom we shall mention afterwards, penetrated into it; notwithstanding the threatening dangers that lay before them.

The south and last part of Africa is that which is called Negro-Land; it is bounded by Gaoga on the east, Guaiata on the west; and Lybia on the north; but its southern boundaries have been hitherto but little known. In this division there is a celebrated river, called Niger, upon the banks of which its most fertile ground lies. This river rises eastward, near or at the source of the Nile, and continues its course northward to the ocean. It is necessary we should here take notice, that the antients were very inaccurate in their geographical descriptions of Africa; and the reason was, many different people settled in this part of the world, and gave new names to places, which led writers

into confusion; particularly the Romans, who knew little more of the country than what they learned from their military officers.

Africa; properly speaking, is a peninsula; and had the great Sesostris; king of Egypt, completed his design of making a cut between the Red Sea and the Mediterranean, it would have been an island. Throughout every part of it the inhabitants, as in all uncivilized countries, are extremely numerous and healthy; and being in many parts divided into small communities, they are continually at war; and when they take any captives, they sell them as slaves. In this barbarous practice they receive much encouragement from the Europeans; perhaps from those who have settlements in the West Indies, and other parts of America. In this avarice triumphs over the laws of humanity, and our fellow-creatures are sold like beasts of burden. And although thousands of these unfortunate creatures are annually sold as slaves, yet they are so numerous at home, that they never seem to diminish. It is probable this trade will, at last, fall into contempt; and the sooner it does so, the more it will redound to the honour of human nature. But leaving this subject, we shall now proceed to give an account of every thing curious, as related by our best modern travellers, who have visited the different provinces.

TRAVELS THROUGH EGYPT, AND SOME OF THE ADJACENT PARTS OF AFRICA.

By POCOCK, NORDEN, the DUTCH AMBASSADORS, and others.

DOCTOR RICHARD POCOCK, late lord bishop of Ossory, in the kingdom of Ireland, was a gentleman of as great talents as any of his contemporaries; and soon after he left the university, he formed a notion of gratifying his curiosity by visiting some of the most remarkable places both in Egypt and in Arabia.

This gentleman had, in his most early youth, addicted himself much to the study of antient geography, particularly to the accounts we have of places in the Old Testament; he joined himself to several other gentlemen, who had formed a party to accompany him. They travelled over France, and into Italy, where they took shipping at Leghorn, and on the seventh of September arrived at Alexandria in Egypt. They were only twenty-five days on their passage, nor did they meet with any accident; a circumstance the doctor always mentioned with gratitude to the Supreme Being. As they were all persons of considerable fortunes and great knowledge, consequently they had many opportunities of making proper remarks on what they saw; and these we shall deliver as related by the doctor.

“ Alexandria (says Dr. Pocock) was formerly reckoned one of the greatest cities in Africa, and was founded by Alexander the Great, from whom it derives its name; and before the passage to the East Indies by the Cape of Good Hope was discovered, it was a place of prodigious trade. At present the old city is entirely ruined, and the new one built out of the materials: The sea has withdrawn itself from it in some places, and encroached upon it in others. The famous light-house, called Pharos, stood on an island at the entrance into the port, but it is now swallowed up by the sea.

When Alexandria was taken by the Saracens, it contained so many palaces, squares, and other stately buildings, that it was, next to Rome and Constantinople, one of the greatest cities in the world. Besides the natives of the place, there were near forty thousand Jews in it, and a vast number of Greek Christians.

At present the most remarkable remains of antiquity are, Pompey's pillar, and the cisterns, by which water was conveyed under-ground to supply the inhabitants. The descent into these cisterns is by round wells, wherein there are holes for the feet, distant from each other about two thirds of a yard; and by these the people, who are employed to cleanse them, go down. The water is drawn up by a pulley, and carried about on the backs of camels, to be sold to the inhabitants.

Pompey's pillar stands on a small eminence, about a quarter of a mile south of the walls; and is surrounded by some magnificent ruins, which, according to several Arabian historians, are the remains of Julius Cæsar's palace; and in the centre of the area this pillar was erected. By what means this pillar came first to be called Pompey's, does not appear; for it is more probable that it was set up in memory of either Titus or Adrian, who were both in Egypt; and that after the time of Strabo, who made no mention of it; which he certainly would not have neglected, had such a monument existed in his days. It is of red granite, and the capitals are of the Corinthian order, but none of the leaves are indented, which points out some fault in the architecture. There has been upon it formerly a Greek inscription, but it is now quite defaced; and this is another circumstance to prove that it was not erected for Pompey; for the Greek language was but little used by the Romans till many years after his time; particularly in the reign of Adrian.

The whole height of this pillar is one hundred and fourteen feet, including the pedestal and capital; but exclusive of these, the body is eighty-eight feet nine inches, and the diameter nine feet.

Within the walls of Alexandria are three convents; one of which belongs to the Cophis, who pretend to have the head of St. Mark the Evangelist, together with some other parts of his body. They also shew the patriarch's chair, with a vast number of other pretended relics. Near the gate where the evangelist suffered martyrdom, are some remains of a church deli-

cated

cated to him, wherein the patriarch of Alexandria resided; and near this is a mosque, wherein are no less than one thousand and twenty pillars. It is a stately fabric, and finely adorned; but the Mahometans are very shy in admitting people into any of their temples. In some of the houses they have oratories erected for family devotions; and there all the people in the house resort, except they be females, and these are by no means admitted, it being contrary to the law of Mahomet, which orders the women to be kept under severe restraints.

The present city of Alexandria is built on the very edge of the sea, and the side next the land has many beautiful gardens, where the people resort to in the evenings. Almost all the houses have square courts before them, and porticoes at their doors, composed of granite pillars, which were brought from the ruins of the antient city. There are still a great number of inhabitants in it; and besides the native Egyptians, who are mostly Turks, the rest are Greeks, Jews, and Ethiopians. The Arabian merchants come here to trade with their spices, and in their return home to their own country they cross the wilderness of Sinai adjoining to the Red Sea, but they are very insolent to travellers.

From Alexandria we travelled in company with the English consul for Rosetta, and were met by the French consul about a mile from that place, attended by some merchants of the same nation. Agreeable to the politeness of the French, we were conducted to a spacious tent, where we were regaled with a collation of fruits and sweetmeats that had been hospitably prepared for us.

Having refreshed ourselves, we were by order of the French consul all mounted on fine horses, attended by a guide; and in that manner we made our public entry into the city. The governor received us in the most hospitable manner, and ordered a grand entertainment for us; and it was with the utmost difficulty we could prevail upon him to accept of a few presents.

From Alexandria to Rosetta, the road is over a barren desert, and it would be extremely difficult to cross it, were it not that posts are fixed up to direct travellers, much in the same manner as our milestones in England. At one of these posts we found a large vase, into which the waters of the Nile are conveyed for the refreshment of travellers, and the expence of keeping this in order is defrayed by the voluntary contributions of some charitable persons.

Rosetta is about two miles in length, and all European goods that are brought from Alexandria to Cairo, are landed here, and put on board other vessels. For this purpose, the Europeans have always a vice consul, and factors here to transact business, and letters are brought here over land from Alexandria to be sent to Cairo by water, but in matters of great importance they are sent across the desert by special messengers. Here is a considerable manufactory of coarse linens; and there is a mosque, which they say was the residence of one of the relations of Mahomet; and in case Mecca should be taken by an enemy, they believe the scene of devotion would be established here.

Here we saw two of those idiots whom the Egyptians look upon as saints, for stupidity and sanctity are considered as the same wherever the Mahometan religion is professed. One of these was a dirty elderly man, and the other not above eighteen. They had both been born idiots, and walked about the streets naked, being held in great veneration by the stupid deluded people. On Friday when the devotees visited the mosques, they kissed the hands of these poor creatures with all the marks of exterior devotion, and fondly imagine that they derive considerable advantages from that single circumstance. We saw one of these idiots whom they call saints, sitting at the door of a mosque, with a woman on each side of him, and although a whole caravan was at that time passing by to Mecca, yet none of the people took any

notice of it, being so much accustomed to things of that nature.

Finding the Greek patriarch was then at Rosetta, we were induced from motives of curiosity to visit him. We were introduced by the secretary belonging to the French consul, and received with every mark of respect. Servants presented us with lighted pipes, and after that each of us had sweetmeats set before us. This was followed with coffee and sherbet, and a towel to wipe our hands; for the manner of eating here is not always the most cleanly. At our departure they sprinkled rose water over our hands, and being perfumed with incense we took our leave. The patriarch was a man far advanced in years, of a grave aspect, and something engaging in the whole of his deportment. He was however extremely ignorant of ecclesiastical history, and of all those points in theology upon which salvation depends. The whole of his learning seemed confined to the repetition of a few ceremonial traditions of no manner of service to any but those of his own communion, who are even more ignorant here than in Greece.

Having obtained our dismissal in a friendly manner, we embarked along with the English and French consuls on board a fine galley bound for Cairo. In our way thither we were becalmed near a small town, the governor of which sent for us, and treated us with coffee, and at our departure made us a present of some eggs, which we cheerfully accepted. Continuing on in our course, we stopped at the harbour of Ovardeh, where we visited the governor, who would have treated us in the most hospitable manner, but finding we did not chuse to stay, he sent some of his servants on board with a lamb, and one hundred eggs. Having given us some hints that a little wine would be acceptable to him, we sent him as much as we could spare in a private manner, it being contrary to the alcoran for any of the Mahometans to drink of that liquor.

The night before we finished this agreeable voyage, we spent at Hebe, a small village about five miles from Cairo, into which the next day the consuls, with all their retinue made their public entry on horseback; this being a privilege allowed to no Christians but the French and English. Six janisaries walked before us, and sprinkled water upon the ground to allay the dust.

Old Cairo was formerly called Babylon, because a city and fortress was built here by some refugees who had made their escape from Babylon on the Euphrates. Old Cairo was formerly much celebrated for its magnificence, and is at present divided into three towns about a mile distant from each other. The first of these is Old Cairo. The second is Cairo properly so called, and the third is Bulac, the place where the ships come into harbour. The trade carried on here is very considerable, and the imports are, broad cloths, tin, lead, raw silks from the Indies, neat brass and iron work; with curious ornaments of silver. The exports are coffee, flax, drugs, and various sorts of dyes, with some sugar which is not good, except a little which the basha seizes for the use of the grand signor.

The people here are very ingenious; but in proceeding further up the Nile we found them very heavy, clumsy, and stupid. The Egyptians give no credit for any goods whatever, but are always paid in ready money, every man being his own banker. This is found to be attended with very beneficial consequences, for it has been proved by experience that unlimited credit has, in all ages and nations, been the ruin of trade.

In this city are a vast number of inhabitants, besides the original Egyptians, particularly, Greeks, Jews, Armenians, Europeans, and a Mulotto race, who have a sort of civil government among themselves. They are natives of Nubia, and, like the Savoyards, when they travel into France, supply the merchants with servants, and they have a common purse, out of which they support each other when they are rich; when these fellows have it in their

power,

power, they are extremely insolent; but in general the Turkish government keeps them under proper restraints.

The Franciscan friars have a convent here; and the superior is called the Præfal of Egypt; they being extremely fond of borrowing Roman names. The monastery belonging to their order is a stately building, which cost considerable sums of money before they could finish it, having been pulled down by a mob, spirited up by some people in power; whose desires the poor fathers were not able to gratify. Here is likewise a convent of missionaries, who come to spread the tenets of popery; who might as well have staid at Rome, seeing the Mahometans are not idolators, and far less superstitious in their rites and ceremonies than the Roman Catholics.

Such English gentlemen as happen to die here are buried according to the rites of the Greek church, if they have no clergyman of their own in the place; for this is a privilege which neither the Mahometans nor Roman Catholics will indulge them with. The country affording all the necessaries of life, the Europeans live comfortably enough; and though much confined, they are social and agreeable to each other. The morning is spent in business, and the remainder of the day in innocent amusements and diversions. Far different from the countries where they were born, they are for the most part very hospitable to strangers, who are sure to meet with a kind reception from them; and indeed were these strangers not to meet with accommodation from them, they would find it difficult to procure them any where else.

There are a great many bagnios in Cairo, some of which are appropriated to the women, who frequent them once or twice a week. Females of rank are not permitted to visit these places, having bagnios in their own houses, where they are under the inspection of their governautes and husbands. The kanes in this city are but indifferent, having few conveniencies for travellers; but the people are in general civil and obliging.

The houses at Cairo are almost all built on the same plan, only that they differ in magnitude, according to the rank of the proprietors, and uses for which they were designed. The antient palace of the sultans who formerly resided in Egypt, is built round a court, and the entrance to the grand apartments is through a gate built in the Gothic taste; on each side of the court are elegant rows of pillars, worked so, that at first sight they appear as if they had been woven together. The saloon is constructed in the form of a Greek cross, with a cupola in the middle. The wainscot is ten feet high, adorned with mother of pearl, fine marble, and curious pieces of Mosaic work.

There are a vast number of inscriptions above the wainscotting, running round the whole of the saloon, and these are written in the Arabic language. The great men in general have a saloon for common use, and another for public feasts and entertainments; and as they have commonly four wives, so each of these has a saloon.

These saloons for the women have apartments round them, but they have no communication with the rest of the house, except the common entrance for the servants, which is kept locked; and the private entrance for the master, who keeps the key. Here they have such a machine made to turn round, as is used in nunneries, which receives any thing the women give out or take in, without being seen.

In general the dwelling-houses in Cairo are rather useful than handsome; the lower part being built of stone, and the upper part of cage-work, lined with unburnt bricks. They have few windows towards the streets, and there being little regularity, they present but a very indifferent sight to an European. The streets are so narrow, that they frequently extend a covering from the roof of one house to another, which shelters passengers from the heat of the sun.

The government of this city is well regulated, there being a gate at the ends of most of the streets, and these are shut up as soon as it is dark; and being guarded by a body of janisaries, no idle, disorderly people can walk about to disturb the peace of the inhabitants.

Here are many magnificent mosques, particularly one built by Sultan Hapan, which was the grandest we had ever seen. It was formerly a sanctuary for criminals; but that privilege is now taken away from it. In the apartments adjoining to it, a garrison of janisaries is kept; for the place is very strong. This mosque, with all its buildings, stands at the foot of the castle hill, and is more costly than is usual in Turkey. The top is curiously carved, and the entrance finely inlaid with pieces of marble, of various colours.

At a considerable distance from this is another mosque belonging to the Arabs, which is greatly admired, being sixty feet square within, crowned with a beautiful dome, and lined to the height of eight feet, with fine red and green porphyry. The carvings and gildings of this mosque are well worth the notice of travellers; and all round the walls are Arabic inscriptions in golden letters.

The cupola is finely painted, and a number of glass lamps, with ostriches eggs, artificially disposed, contribute much to the beauties of the place. This mosque is said to have been built by a vizir, who desired the sultan to permit him to prepare a place fit for his reception upon his return from Mecca.

The castle was built by the Great Saladine, and stands on a rocky hill, a little to the south of the city. It has four entrances, the last of which is called the gate of the janisaries, and is on the east. It is encompassed by stone walls, very strong, and defended by many towers. It was undoubtedly a place of great strength in former times; but it cannot be so now, because there is a hill that commands it, from whence a few great guns might easily beat it down. The westward of the castle is taken up by workmen, employed in making hangings and coverings, annually sent to Mecca, and these we took a near view of; but for a Christian to touch them, or even breath upon them, is considered as the highest degree of profanation.

These apartments are said to have been inhabited by the bashas; and it is very probable they were formerly the apartments of the sultan; there being still many curious remains, which point out their antient grandeur.

When the waters of the Nile rise, they are conveyed by means of canals to the different parts of the city; and it affords an entertaining prospect at that time, to see the inhabitants diverting themselves in their boats and barges, with music, feasting, and fire-works, while crowds of people lean from the windows of their houses, which seem as if they rose out of the water. When the water returns, it is amazing to see what slime and mud is left behind; but that is soon covered with verdure and fertility.

The granaries made by Joseph are still to be seen; at least they go by that name, and are still used to keep in store a certain quantity of corn. They are square rooms, encompassed by walls fifteen feet high, built of very hard bricks, although they seem to have been originally of stone. The grain is covered with matting; and certain allowances are made to the reapers. To prevent the birds from getting at it, the locks of the doors are covered with clay, and sealed. The corn is generally brought down from Upper Cairo, and distributed among the soldiers, as part of their pay, who sell it. Six of these granaries are full of wheat, one of barley, and the other is for feeding the horses.

A little to the northward of Old Cairo, there is a grand building, used for raising the waters of the Nile to an aqueduct, which is done by means of wheels and oxen. The aqueduct itself is very grand, being built in the rustic stile upon arches, and piers of different dimensions. Towards the hill where the ground

ground rises, the arches are low, and the water is raised to the reservoir, by means of wheels raised above one another.

Near this reservoir is another, from whence water is conveyed to Cairo; and as it is a Roman work, probably it was built by Trajan. Near the mouth of it they perform the ceremony of opening the canal, by breaking down a mound that runs across it, when the Nile is at a certain height. This is done with public rejoicings, and a pillar standing near it, adorned with flowers, over which the water rushing, carries them away.

This offering comes in the room of virgins, who in antient pagan times were annually sacrificed to the god of the rivers.

It is supposed that the north winds are the true cause of its overflowing in such a manner. These winds begin to blow about the latter end of May, and drive the clouds, formed by the Mediterranean southward, as far as the mountains of Ethiopia, which stopping their course, they condense, and fall down in violent rains, at which time even wild beasts, directed by instinct, retire before the torrents, and seek shelter elsewhere. These winds also contribute to the driving forward the sea, which meeting with the river, opposes its progress, already swelled by the rain, and thus the country is entirely overflowed.

The Coptic priests assert that the Nile begins to rise every year on the same day; but this we know is not true, although generally it begins about the middle of June. They believe that a great dew falls the night before the river begins to swell, which they call *Nokta*, and they say it purifies the air, which causes the water to ferment, and turn red, or sometimes green.

It is very certain that they change their colour, and continue discoloured for twenty or thirty days after they begin to rise. They are all that time very unwholsome; so that the inhabitants, during that period, drink the water preserved in cisterns.

Some of the people imagine that when the sources of the Nile begins to swell, there is forced out with them a sediment of green and red filth, which has remained caked upon the borders; or near the banks of the many small rivers which flow into it, near the place where it takes its rise. But although there is very little water in the Nile, when at the lowest, yet it cannot be supposed intirely to stagnate. As the waters continue to rise, they become more and more wholsome; and then the people venture to drink them, and preserve them in jars, the insides of which they rub with pounded almonds; the oil being extracted, and kept for other purposes.

The waters do not resume their colour for a considerable time after they become wholsome; and the height of the river decreases gradually, till the very time it begins again to rise. The grand signor has no title to his rents or taxes till the canal is opened at Cairo, by breaking down the bank thrown up before it; which is not to be done till the water rises sixteen pikes; for they are not to pay the tribute till it is at that height.

The Nile has been sometimes known to rise irregularly, as it did in 1737, at which the people were greatly alarmed, having always observed that Egypt had been unfortunate when the Nile rose out of season. The observation however did not hold good at this time; for nothing ensued that was in the least remarkable, and the following year was extremely plentiful, for the waters rose rather higher than usual; we could not discover whether there were the same sort of fishes in the Nile as are found in the rivers in Europe, except eels and mullets; which last, with some others, come from the sea at particular seasons.

Having viewed the channel of this surprising river, we returned to Cairo, and viewed several things that had not hitherto come under our notice. In the basha's apartments in the castle, is the divan or council held, by whose advice all the affairs of government

are regulated. In the room where the council meets, are many pieces of antient, warlike instruments, which were used by the first sultan of Egypt; when they propagated the religion of Mahomet by the sword. The council meets three times every week; to receive petitions, to redress grievances, punish offenders; and to do justice to all. Near the council-chamber is the mint, where the money is coined, which is only small pieces of iron, washed over with silver, the money of Constantinople not passing in Egypt; and as for European merchants, who reside here, they take all their return in goods.

There is a well in the castle; called Joseph's; a vizir of that name, and not from the patriarch, as the vulgar affect to believe. This well is a very extraordinary work; being dug through a solid rock; but on examining it, we found that the stone was not so hard as we at first imagined. It is rather a chain of wells; than a single one, and the first is an hundred and fifty feet deep, to which there is a descent by very ill-contrived steps, at six inches deep each. At the bottom of the first well there is an entrance into another, one hundred and forty feet high to the top; and from it there was formerly a passage leading under ground to the pyramids; but that is now stopped up. The last well is on a level with the Nile, and is never without water; but it is rather brackish, and is raised by a wheel, turned by oxen, and then comes to the top by another machine of the same nature.

The castle wherein we found Joseph's Well, is a court a mile in circumference, and at a little distance has the appearance of a town; but is now in a ruinous condition. To the south of it is a village called Caraffa, where there are some magnificent tombs, said to be the sepulchres of some antient caliphs, who were relations of Mahomet, and conquered Egypt. The people hold their tombs in so much respect, that they oblige all Jews and Christians, who pass by them, to dismount, and walk on foot. Caraffa was famous in former times for its colleges of dervises, or Mahometan monks; but it is now little better than a heap of ruins.

In the same neighbourhood is the burial-place of the Jews; and we went to see it, conducted by a guard of Arabs, who, although well paid for their trouble, seldom fail to use travellers ill. When a Jew is to be buried, they dig a grave six feet deep, and making a hole still lower to the west, they deposit the corpse herein, and cover it with broad stones; it being unlawful for them to lay earth upon the body. Such as die suddenly in the fields, or any where out of doors, are never carried home, but washed, and stretched out; after which they are interred in the manner already mentioned. It is very probable that this practice is of great antiquity; for we may trace some footsteps of it in the Old Testament.

We ascended an earthen mount called *Jebel Duise*, which seems to have been divided originally from the castle hill by art; and at the east end of it are several grottoes, built on the side of the hill, some of which are inaccessible. Here is a mosque over the south cliff, painted with a variety of flowers on a red ground; and in this mosque, Sheik Duise, with his children, and the sons of some bashas, are interred.

In every place here we found free and easy admittance, and were entertained by the governor, with a handsome collation, which was served up on a carpet, before the door of the mosque. On a hill, a little further, there is a structure of solid stone, about three feet wide, and nine feet square on the top. The ascent to it is by ten steps, and there the governor mounts to pray on any extraordinary occasion; such as the beginning of a war, the continuation of a peace, or the rise or fall of the Nile. Orations of this kind may be found in almost every part of the Turkish empire, and indeed throughout most parts of Asia.

Some Arabian authors have mentioned an observatory on the eastern part of this hill; but there is nothing there at present except an old mosque. A little to the north of this hill, and nearly adjoining to the

bottom of it several of the family of Mahomet lie buried; but the place is deemed so sacred; that no Christians are permitted to walk among the sepulchres.

In Cairo is a Jewish synagogue; said to be sixteen hundred years old, in which are two manuscripts of the pentateuch, and one of the whole Old Testament, said to have been written by Ezra, who in writing it constantly omitted to mention the sacred name of God, but next day found the deficiency made up by an invisible hand. It is kept in a niche ten feet high, and no person is permitted to touch it. A veil hangs before the niche, and lamps are kept continually burning. As they would not permit us to look at it, we naturally concluded that it was no more than one of their own forgeries. Indeed we were often told idle tales by the Jews, concerning their antient manuscripts, but we never paid much regard to them.

There is a Greek church here dedicated to St. Barbara, wherein it is pretended her head is still to be seen. Here are many other Christian churches, some belonging to the Greeks, and some to the Coptics; but of the first preaching of Christianity in Egypt, we shall now proceed to give some account.

According to Eusebius, the gospel was first preached in Egypt by the Evangelist St. Mark, who is reckoned the first patriarch of Egypt; but during the severity of persecution, many of the Christians retired for shelter to Coptus, and the places in its neighbourhood, and it was from this circumstance that they were called Coptics.

At Alexandria there was an uninterrupted succession of bishops, till the time of Constantine the Great, and afterwards till the Saracens invaded Egypt. When the Saracens invaded this country, they treated the Greek Christians with great cruelty; but took part with the Coptics, because they did not oppose them so much as the others. From that time down to the present, the Christians have gradually dwindled away in Egypt, and such as remain are cruelly oppressed by the Turks.

With respect to the modern Egyptians, they are a most fordid people, slothful to the last degree; and they take delight in spending their time in idleness, listening to ridiculous tales. It is probable that this indolence is in part owing to the enervating warmth of the climate, which in many respects renders them altogether unfit for action. They are malicious and envious to a great degree, which in some measure prevents them from hatching plots against the government; but although they are ignorant in many things, yet they are naturally cunning, false and mistrustful. They are always suspicious of travellers, whom they suppose visit them in search of concealed treasure. They cannot conceive how the desire of seeing ruins and old walls can induce people to come so far; and these notions prove very disagreeable to those who are curious.

They have, however, learned something of hospitality from the Arabs, so that they will sometimes treat travellers with respect. The cultivation of their lands does not require much trouble, because the ground is soft; and corn, fruit, and herbs, grow up almost spontaneously in consequence of the fertility occasioned by the overflowing of the Nile, as already described, which is one of the greatest wonders in creation.

The Arabs live as vagabonds, by plunder, having no idea of trade or commerce. Great part of their time is spent in attending their flocks, which seems more suited to their genius than any other sort of business. They have exceeding good horses, and manage them well with much address, and those who fight on foot have poles with which they ward off the spear with great art. Those who are called Turks, were sent hither by the order of the Grand Signor, and they differ much in their manners and customs, both from the Arabs and native Egyptians.

Those whom they call Turks are covetous, and extremely fond of power; subtle in all their schemes, and artful in reducing them to practice. They are

frequently employed by travellers to carry on intrigues with the women; and are generally so successful, that by this method of pimping they acquire considerable sums. As they are reckoned nearly connected with the Turkish bashas, so they have considerable favours shewn them; and they always go in the real Turkish dress.

Those whom they call dervises, and who are really a sort of monks, are idle, lurking vagabonds, and are divided into three sorts; first, those who live in convents, and lead a sort of recluse life, although they are not restricted by any vows. Secondly, those who live with their families and follow their different trades, in order to procure a subsistence; but most of their trades consist in dancing like mountebanks, on stages erected for that purpose: on such occasions the people collect money for them, which they carry home to their families. A third sort are those who go about the country begging; and when they sound their horn, every one is obliged to give them something. These dervises are extremely ignorant, being even strangers to their own alcoran, and in many things it is dangerous for a European to have any connections with them. No encouragement is given to reading, so that their intellectual faculties remain unimproved; and as for their bashas, they generally are so cunning as to take part in that tuition which is most likely to support them in their oppressions of the people.

Some few years ago, a basha who had formed an intention to destroy a deputy governor, apprehending that he would refuse the coffee offered him at an entertainment, directed the slave who was to bring it, to make a false step and drop the cup seemingly intended for him. The slave following the direction he had received, the basha desired the deputy to accept of his own cup, which being a particular honour, and apparently harmless, could not be handsomely refused. He drank the coffee without suspicion, which had poison in it, and died within a few hours after. Many such tricks are practised by these merciless bashas, who consider the people over whom they preside as no better than slaves.

The Egyptians form so many cabals among themselves, that their continual quarrelling prevents them from hurting the external government of the nation. Some few years before we arrived in Egypt, a design was formed by a weaker party to destroy some of their enemies, who had raised themselves to a very exorbitant degree of power, which consequently procured them much envy. The scheme had been long laid, and there were above forty persons entrusted with the secret, many of whom were slaves; but an opportunity was wanting to assemble them together. However, the long wished-for day arrived; and while the slaves were serving up the coffee, each killed his man. Some of the destined victims escaped much wounded, but the greatest part fell dead on the spot.

It is from their belief in absolute predestination that the Turks acquire all that courage for which they are so conspicuous in martial achievements. They believe that nothing can happen till the time appointed by the Divine Being; and therefore they engage courageously, not caring whether they are killed or saved, being well convinced that they cannot die sooner than the appointed time. They are so scrupulous, that they never sit down to eat without washing both their hands and feet, and none of their great men can be visited without a present. They make an ostentatious display of the outward forms of religion; and in this they differ from the Arabs, who are seldom seen to pray in public.

And here we may take notice of little differences between the native Egyptians, the Turks, and the Arabs. The Egyptians will not suffer any person to touch their children without blessing them, otherwise they suspect that no good is meant, and immediately use some superstitious ceremonies to prevent the effects of the evil eye; one of which ceremonies consists in throwing salt into the fire.

The Mahometans salute each other by inclining the head, extending the hand, and bringing it back to their breast; or else rising the hand and putting it to their heads. The latter is indeed a mark of extraordinary respect; and they always wish peace to each other, a compliment they never pay to Christians.

The Arabs salute each other by shaking hands and bowing the head; but among the Coptics, a son dares not sit before a father, especially in public company, without being several times desired; and in no place in the world do inferiors shew more respect to superiors. If any one goes to the house of an Arab, bread and four milk is set before him. Eggs are served up at the same time with sliced cucumbers, if they are in season. They are much offended if the visitor does not stay and eat with them; for where there has been any appearance or existence of enmity, a friendly visit puts an end to the dispute.

In these hot countries, the greatest and most wholesome refreshment, is that of going to the bagnio, of which they have many, both in public and private. They undress in the first large room, which generally has a cupola over it; and from thence pass into the hot room, where they are washed and rubbed with hair-cloths. The feet are rubbed with a sort of grater, made of earthen-ware, much in the same form as the body of a bird, and after this they are shaved and go into the bath. From this place they return by a room not so hot, where they stay a short time, and before they re-enter the great room, they repose themselves on a bed, smoke their pipes, drink their coffee; after which they dress. It is certain, this must be very conducive towards promoting their health; for as many of them wear woollen shirts, the correlative particles issuing from the porous parts of the body would be apt to breed an infection.

In Egypt the people set out early in the morning on journies, and walk their horses, or whatever beasts they ride on, gently. They often stop to refresh, but generally under a shade, when the weather is warm. If they do not travel in a magnificent manner, they carry along with them a leathern bottle of water tied to the saddle, and of this they drink when thirsty; but the grandees have camels loaded with all things necessary. They seldom have tents at night, but lie in the open air, having large lanterns, the tops and bottoms of which are copper tinned over, and the sides of linen, stretched upon wires. These are carried before them; and when they lie down to sleep, they are hung upon poles.

Some of the ladies of higher rank travel in litters carried by camels, which creatures are very useful in that part of the world. Some are carried on the back of one camel, and indeed every one, according to their different ranks. Some of the courtiers have saddles on their camels, but their servants are obliged to ride between panniers. Most of their servants are slaves, so that it is no difficult matter to make them perform whatever is required of them by their imperious masters.

The most extraordinary sort of conveyance is by means of a round basket, slung on each side of the camel, with a cover, which holds all their necessaries, and on it a person sits cross-legged. They have also a carriage like the body of an uncovered chaise or chair, which is very convenient, as they can sit in it, and stretch out their legs. The pilgrims, who travel to Mecca, commonly wear a sort of black cloak, with a cowl, but in Egypt their cowls are generally white. It is fastened about the neck with a long loop, and hangs loose behind. All the camels who travel with the pilgrims to Mecca, are covered with yellow silk, and a flag of the same colour is carried before them. It is a common saying, that those Turks who visit Mecca, return more immoral and vicious than when they set out. Thus they say, "If a man has been once to Mecca, take care of him; if he has been twice there, have nothing to do with him; and if he has been three times at Mecca, remove from his neighbourhood." This however is not the remark of the Mahometans, but only of the Jews and Christians, who undoubtedly

take notice of their conduct, and make their remarks upon every part, perhaps with a malevolent eye.

There is some reason to imagine that the dress of the Egyptians has a near resemblance to the most ancient since the deluge, being only a long shirt with wide sleeves tied round the middle. The common people wear over this a woollen shirt; and those of better condition have a long cloth over it, and then a long blue shirt. The dress of ceremony over this, instead of blue, is white. This is the common dress on festival days, and all extraordinary occasions; and probably it was from this that the use of the surplice first arose.

They cover their heads with a black cloth, which they fasten under their chins with a ribbon in cold weather. It is common for the Arabs to wear a large blanket, either white or brown, in winter; and in summer a piece of blue and white cotton, thrown over the right arm, and brought about to the left. When it is hot, and they are on horseback, they let their covering fall behind, and rest on the saddle, so that they are no ways encumbered with it; but ride on at their ease, let the weather be ever so hot.

The dress of the women has a near resemblance to that of the men, only that most of their under garments are of silk, as well as their drawers. All but the outer vest are shorter than those worn by the men. Their sleeves hang down to a great length, and a sort of gauze shirt under all, trails to the ground. Their heads are dressed with an embroidered handkerchief, and the hair is plaited round, under a small woollen cap. The meaner sort of women wear a large linen or cotton blue garment, like our surplice, and before her face hangs a sort of bib, which is joined to their head-dress, there being a space left between for the eyes. The better sort, who wear this garment made of silk, have a large black veil, that comes all over them, and sometimes this is of gauze; especially that part which covers the head. The slaves, who are generally blacks, wear rings in their noses, to which hang glass beads by way of ornament.

In Cairo the women ride on asses, with very short stirrups, which is considered as a dishonour for men to use. They have a prophecy, that Cairo will be taken by a woman on horseback, and therefore they strictly forbid the use of horses to that sex. When women ride, they generally wear yellow stockings, without soles; and ladies of quality have a great many slaves who ride behind them on asses. These have close garments, with a cap that hangs down behind, and they make a much better figure than their mistresses. At certain hours the women resort to their bagnios, where they converse freely concerning the characters of those who are absent, in the same manner as our ladies do at their balls, routs, and assemblies. There are some who go barefaced about the streets, singing and dancing; but these are considered as common prostitutes. In general the natives of Egypt are but a mean looking people, and though many of them are fair when young; yet as they grow up, the heat of the sun has such an effect upon them, that they appear altogether swarthy. They are extremely dirty, and in many respects the greatest slovens in the world; especially the Coptics, who, after washing their faces, wipe them with the sleeves of their long shirts. Cleanliness is not known among them, and perhaps to this is owing the return of the plague, so frequent in this country.

Egypt abounds with reptiles, of which there are many different sorts; and their vipers are much esteemed in physick. They are in colour yellow, like the sand in which they are bred, and one sort of them have horns much like those of snails, but much stronger. The common lizard is also yellow; and in the deserts, towards Suez, there is a small sort differing from the common ones, having a broad head, and the body covered with thick scales. About the ruins and old walls there is a very ugly sort, they are almost like a crocodile, and these are very mischievous. The worral, which is also of the lizard kind, is four feet long, and eight inches broad, with a forked tongue, which it puts out like a serpent; it has no feet, and lives mostly

on flies and small lizards. It is never found but in the hottest seasons, in grottoes and caverns in the mountains on the west side of the Nile, where it sleeps during the winter. The ostrich is common here; and the Arabs, when they kill them, have a method of dressing up their fat, so as to compose thereof a valuable medicine, which they sell at a considerable advantage.

They have a large domestic hawk, which most commonly frequents the tops of houses, and one may frequently see the pigeons and these hawks standing close together. They are not birds of prey, but when they find flesh, they will eat it. The Turks have a more than ordinary veneration for them; so that they never suffer any one to kill them. This Turkish veneration seems to be a relic of the antient idolatry of the Egyptians, who worshipped many different sorts of animals; and by these laws it was death to kill any of them.

All those who have read the history of Egypt, know what veneration was paid to the ibis, because that creature destroyed the serpents, which bred in the mud formed by the overflowing of the Nile. There is at present a very beautiful bird of this species, called the belferey, the males of which have a black beak and legs, and black feathers about the wings, with a large crooked bill, wherewith they take their food out of the water.

The legs, bill, and eyes of the female are of a fiery red; and in the wings and tail are intermixed some red feathers, which, when expanded, are beautiful. They have great numbers of wild geese, which differ much from those in Europe, and are called *Bauk*. Wild ducks in great numbers frequent the pools in the low grounds, which seldom dry up in less than two or three months after the Nile has left the upper lands.

Quails, woodcocks, and snipes abound here in great numbers; and there is a wild pigeon of a brownish colour, and very small; but these are never eaten. The pigeons may be considered as part of the husbandman's stock; and they have vast numbers of pigeon-houses, which being built round, make a fine appearance at a distance. The partridge in this country is very different from that in other parts. The feathers of the female are like those of a woodcock; and the male is a beautiful brown bird, of the same colour with some of their wild doves, but adorned with larger and lighter spots.

The bats in the buildings are extremely large; nay, perch ps the largest in the world; for from the tip of one wing to the other, some of them measure little less than two feet.

Before we close this account of their animals, it is necessary that we should say something concerning the crocodile, especially as it is one of the objects of a traveller's notice in Egypt. This voracious creature is a native of the Nile, although there are some of them in other parts of the world. It has two long teeth in its lower jaw, which are received into two holes in the upper, which serve by way of a sheath when it shuts its mouth. It is very quick-sighted, so that few things can escape its notice. The eggs are somewhat like those of a goose, and it buries them in the sand the depth of a foot beyond the bounds of the Nile's overflowing, and is careful of its young, which run into the water as soon as they are hatched. The people search for the eggs; and when they have found them, they break them with iron spikes.

But they are chiefly destroyed by the ichneumon, here called Pharaoh's rats. The crocodile, when on land, is always seen near the water, with his head towards it; and if he is disturbed, he walks gently in and disappears by degrees; yet it is said they can run fast; we saw many of them along the shore of the river, sunning themselves in the day. The people told us, that they never seize a man swimming; but if he stands upon the bank, they spring out and grasp him with their fore claws; and if he is at too great a distance, they endeavour to strike him down with their

tail. They may be shot or stabbed under the belly, where the skin is soft; but it would be to no purpose to assail them on the back, that being strongly fenced by scales, which serve as a sort of very good armour. Those who take them, feign the cry of an animal at a distance, at which the crocodile running out, a spear, with a rope tied to it, is thrust into his body; whereupon he runs back to the water, out of which he is dragged when they imagine him quite spent, and a pole thrust into his mouth, they then jump on his back, and tie his jaws together.

Having said thus much concerning animals, &c. we shall now proceed to describe such curiosities in the neighbourhood of Cairo, as have not hitherto been mentioned; particularly the pyramids, which have always been considered as among the wonders of the world.

Of these, the most remarkable are the pyramids of Gizeh; but most of them now lie in a very shattered condition. They were originally cased with a very hard stone, brought at a vast expence from the mountains of Arabia, near the Red Sea, and conveyed by means of a canal that runs about two miles to the westward, and partly by a fine causeway, of which there are still some remains.

In the middle of each pyramid there was a stone, which when removed, led to the subterraneous passages where the dead bodies of their kings, and other great men were buried. In the front of the second pyramid, about a quarter of a mile to the eastward, lies the famous statue of the sphinx, now certainly known to have been cut out of the solid rock.

This is a monument of most extraordinary dimensions, being by the most exact measurement twenty-seven feet high, having only the neck and head above ground, and the lower part of the neck is thirty-three feet in diameter. Some of our company climbed to the top of the head, where they discovered a hole; which very probably was the channel whereby the priests communicated their false oracles to the credulous multitude. There is also an opening in the back, which probably led to the subterranean apartments. We visited these pyramids twice; the first time in company with some French gentlemen, attended by the governor of Gizeh, who set before us a fine lesson of hospitality, by distributing a share of an entertainment he had provided among the poor Arabs who crowded round him; and this he did before he had tasted any of it himself.

The second time we visited them was in company with the English consul, and several merchants from our own country. We took up our quarters in tents, half a mile to the south of the pyramids, and were soon surrounded by the peasants of the neighbouring villages, who artfully stole some of our cloaths; but they were quickly restored, when the consul threatened to complain of them to the governor. It was at this time we descended a little way into one of the pyramids, by means of holes broke through the sides of the building; but the descent was so difficult, that none of the Arabs would venture to accompany us; so that we were afraid to proceed far, lest we should meet with any accidents. But still our curiosity was not gratified; so that next day we sent for rope ladders, which were of great service to us, although the vast quantities of sand falling constantly down rendered our situation very incommodious.

The first entrance into the pyramid, after passing through the narrow opening already mentioned, was by taking out some stones whereby a passage was discovered, secured with the finest white marble, at least one hundred feet deep; the polish of which was certainly very fine, by the torches and candles, which travellers are obliged to carry along with them, to give them light when they search after curiosities.

There is nothing more probable than that those who first penetrated into those hidden mansions of the dead, expected to find valuable treasures concealed; for it must have cost them vast labour; and such was their barbarity, that they have torn up many parts of

the floor, broken the casements; and the effects of their fury are to be seen on every hand. Nor can they be viewed by a man of taste, and a lover of antiquity, without some degree of feeling.

Having at length made way into the inner room, in which the body of the royal founder was probably deposited, and to conceal which, the architect had taken prodigious pains, there appears a most beautiful, granite marble, seven or eight feet long, and about four and a half deep; but the remains of the body are not to be formed. This sepulchre was covered, as appears from the form of its edge, but the lid has been carried away. This apartment is nineteen feet high, thirty-two long, and sixteen broad. The whole of the architecture shews that it could not have been designed for any other purpose but that of a sepulchre; for unless that is granted, we cannot account for them.

From Cairo we set out for Faiume, along with the governor of that province, to whom we had been strongly recommended. Having travelled the greatest part of the day, we stopped to refresh ourselves; and the governor, who was a man of great hospitality, treated us with rice, onions, and a sort of pickled cheese with bread. That evening we encamped under a fine grove of palm-trees; and the governor, who could not sup with us, sent us victuals from his own table. The next day we ascended some sandy hills, and after several hours travelling, arrived at a small valley pleasantly shaded with trees. This vale is bounded on the north by low hills, entirely made up of oyster-shells and a little red clay. These oyster-shells are very large, many of them petrified, but not otherwise changed in their quality. At length we came to Tameia, where there is a pond, surrounded by a strong brick-wall at least half a mile in circumference, and this is of great service to the neighbouring country round about it, being supplied from a canal communicating with the Nile.

The village called Sennours is large and pleasant; and when we passed through it, the governor sent us an invitation to spend the evening at his house. We were received into a large open room, the floor of which was covered with carpets, whereon were laid all sorts of sweetmeats; and the whole supper consisted of ten dishes, all different from each other, among which was a sheep boiled whole, and a lamb roasted, with several fowls, and abundance of soups. In the morning we were finely regaled with every thing necessary, such as bread, butter, fried eggs, honey, greens, salt, cheese, wines, and every thing else that the country could afford.

We were now in the most delightful province of Arsinoe, which was formerly reckoned one of the most charming spots in Egypt, producing as it were spontaneously the olive, which cannot be cultivated at Alexandria without great art. From this place we continued our journey through Baiamont, where there are two pyramids of free stone, the corners of which are solid. Here, as well as at Faiume, many antique seals and medals are found among the sand and rubbish. Having crossed a fine canal, we came to the new town of Faiume, a populous wealthy place; but the houses are built of unburnt bricks. Here the governor resides, attended by a council of twenty Arabs, who are men of property; and the cadi, in the presence of the governor, holds a court twice every week, to distribute impartial justice. The people of this town are famous for their curious art of distilling rose-water, and manufacturing fine carpets for the floors of rooms. They likewise manufacture several other articles, such as coarse woollen cloths, portmanteaus, and leathern bags for holding water. Here are some Christians who have vineyards near the town, wherein they make good white wine; and they have also fine raisins which the Mahometans boil to a syrrop, then serve it up at their tables, and eat it with their bread. It has a very agreeable flavour, and may be used instead of sugar. There is a small convent of Franciscans in the town; and although the

fathers wear the habit of their order, yet they are considered under the denomination of physicians. This convent was broke open and plundered about the year 1737, in consequence of some Europeans having killed a renegado.

During our stay here, we were accommodated with an apartment in the house of the governor, with whom we often dined, and we observed that during dinner the drams went plentifully round. Innocent jests passed between the governor and the company, for the Turks can at any time lay aside that gravity for which they are so much distinguished. This is not much to be wondered at, when we consider the import of the antient proverb, "Keep a bow always bent, and it will never shoot."

One morning, and the greatest part of the same day it hailed excessively, and the hail was succeeded by a violent rain; and we having unfortunately sent back our horses to Cairo, found ourselves under many difficulties in procuring others, which were not only very bad, but extremely dear. We had now an opportunity of examining the antient Arsinoe, which now lies in a heap of ruins, but there are still to be seen some marks of its antient grandeur in the remains of canals, and a round brick building which seems to have been formerly a bagnio; and this conjecture of ours is confirmed by the common reports of the people, who have it from tradition.

From Faiume we proceeded towards Nefse through groves of palm-trees, and a country abounding with vines. There are several things worthy of notice in this part of the country, but in general it is rather barren, although at the same time it would afford all the necessaries of life to the people, were they not oppressed by the exactions of the most extravagant taxes. Here, by the road side, we saw a courtesan sitting unveiled, wanting to be engaged with a paramour. These women are frequently met with in Egypt, but they never insult any person whatever; and when they comply with their desires, they are content to take whatever they are pleased to give.

Nefse is a large village situated on the banks of the Nile, but we were obliged to hire a body of Arabs to conduct us over the Lundey, for which we set out the next day about four o'clock in the morning. On our way we had a distant view of the famous labyrinth, which was built at the time that Egypt was divided into twelve governments, under the direction of twelve different kings. It contained three thousand different rooms, half under, and half above ground, and they were so curiously contrived, that no person could get out of them without a guide.

The whole building was covered with stone, supported by innumerable pillars, and adorned with elegant sculptures. In the lower apartments were deposited the sacred crocodiles, and the bodies of the royal founders. The sacred crocodiles were bred up in the neighbourhood, and the reason why they were worshipped is said to have arisen from the following incident. One of the kings of Egypt having been pursued by his own dogs, was in danger of being torn in pieces by them, when plunging for safety into the lake, a crocodile presented his back, and waded the king over to the opposite shore. The king, from motives of gratitude, ordered the crocodile to be worshipped; and not satisfied with giving Arsinoe the name of the City of Crocodiles, he built a pyramid and labyrinth for its interment. This story is no more ridiculous than many others that we frequently meet with in antient history. It was invented by knavish priests to impose upon the credulity of the vulgar, and very probably countenanced by a designing prince, who had nothing more in view than to enslave his subjects, and make them subservient to his purposes, so as to domineer over them as a most inhuman, a most merciless tyrant.

It is impossible for a man who seeks after curiosities to pass within two miles of this celebrated lake without taking a nearer view of it. And although some

authors pretend that it was originally a work of art carried on by king Algris, from whom it has its name; yet this is certainly erroneous; for it must have existed from the beginning of time, although it might have been improved by one of the Egyptian kings. Herodotus very justly asks, what became of all the rubbish dug out of such a vast abyss? It being at present above fifty miles long, and ten broad. Surely it could not be all carried to the Nile and there flung in, that river being in some parts forty miles distant, and at the nearest ten.

Near the lake are the roots of many fig-trees, which may serve to shew that there were once here both vineyards and gardens; but they have been long since destroyed. To fix the time when these vineyards were destroyed, is not now possible; but by rational conjecture we may believe it was done some time before the Romans invaded Egypt, and probably by some of the Ethiopian princes, who were continually invading that kingdom.

About three miles to the south of the lake we began to mount a gentle ascent, on the top of which is a convent built of unburnt bricks; and near it are the remains of a town, but all the houses are demolished. Having satisfied our curiosity with respect to the lake, and every thing adjoining to and connected with it, we returned to Nefte, where we were glad to find some repose, after having been eighteen hours without rest. Here we presented the deputy governor with some coffee, and he in return invited us to lodge at his house. We staid there but one night, and in the morning the governor was so obliging as to send some of his slaves to conduct us several miles out of the place.

We were obliged to visit Faiume a second time, in order to see the two great pyramids of Davaras, but we found it impossible to gratify our curiosity in this particular, the Arabs being so extravagant in their demands for attending us thither; nor would they undertake to insure us from being plundered, so that we were obliged to return to Cairo, without any more than viewing those pyramids at a distance. Before we arrived at Cairo, we were obliged to lodge an evening at Tameia, in the yard of a kane, there being no other place for our reception, unless we had consented to lodge among common prostitutes.

Soon after this tour we resolved to visit Upper Egypt, and the basha granted us letters of recommendation to all the chiefs of the Arabs, who are numerous in that part of the world. We now provided every thing for a long voyage; such as wine, tobacco, soap and red shoes, together with arms sufficient for our defence. We had the good fortune to meet with a boat belonging to the prince of Akmim, and to be recommended to Malim Soliman, a very worthy Coptic, who was to sail along with us. This Malim was the principal person intrusted by that prince, although he never accepted of any employment under him; thereby prudently avoiding the danger of having his family ransacked; it being a common practice for these petty princes to seize whatever their officers die possessed of, alledging, that they were only taking back their own. And though he might have been secure from this insult, through the goodness of the reigning prince, yet his family might have been hardly dealt with under his successors, who in general pay so little regard to moral justice, that they generally break out into acts of oppression.

It was recommended to us, to get dresses peculiar to the customs and manners of the country; and therefore we complied with all this, and suffered our beards to grow. Properly equipped, we embarked on the 6th of December, 1737, in a small boat, called a Marsh, having a mast in the middle, and another at the prow; part of it being covered with matting, under which we sat and reposed ourselves. The same day, towards evening, we arrived at Righah, where we anchored; it being the custom going up the river, always to lay by at night; and as there are many shoals in the river, travellers lie in their boats, and keep upon the watch, to defend themselves from any attacks, or to hinder people

from coming privately on board, as they frequently do, to steal any thing they can find. These thieves are so roguishly ingenious, that when they want to commit any depredations; they smear themselves all over with foot and grease, so that when the boatmen lay hold of them, they easily slip through their fingers, and make their escape. Thus we find these ignorant creatures are not without cunning.

The next day we arrived at the convent of St. Anthony; and here, as in most of the convents of Egypt, the priests are seculars, each having his own wife. We found several of them employed in bringing stones to repair the building.

The officers came to demand the poll-tax; and when they were asked how many they were, they concealed the names of several; so that here was a sort of religious smuggling. Indeed they had so many marks of real poverty, that as soon as the officers were gone, we gave them some small matter in charity.

In order to prevent robbers from coming into this convent, it is encompassed by a strong stone wall, and the church is a tolerable good edifice. They shewed us a great number of relicks, which they said belonged to St. Anthony, who first established a monastic life in a desert, near the Red Sea. They expected their bishop to officiate that day in their church, for the bishops here spend most of their time in going round their respective districts, officiating in the church, and collecting their fees, with those due to the patriarch. All the churches round the country are called monasteries, because there are none left standing but what formerly belonged to convents, of which there were more in Egypt than in any other part of the world.

As crocodiles are hardly ever seen so low upon the river, the monks told us, that by the prayers of St. Anthony, were they to come any farther, they would be obliged to turn upon their backs. This evening we lodged at a large village call d Sment, and next day reached a small island opposite Benadi, where we first saw a young crocodile. The same evening we arrived at Benesuf, which is a town about a mile in circumference, meanly built of unburnt bricks. It is the capital of a province of the same name, where the deputy governor resides; and here is a considerable manufactory carried on in making carpets, and a sort of very coarse thread. They are used by the people to cover the cushions of sofas, and as coats for their children, being wove in such a manner as not to want cutting.

There being nothing more worth seeing in this place, we continued sailing up the Nile till we came to a large island, called Fetne, which is a very fertile spot, planted with melons and cucumbers, in rows of about six feet distance, with Turkey wheat stuck in, to shelter them from the weather; and in some places, instead thereof, a sort of rush, of which they make ropes. Here we lay during that night, and there being another boat to the eastward of us, we fired at a man who was sailing towards it, with a view to rob it, and from a cry which he set up, we concluded that he had been wounded.

The country between this place and the convent of St. Anthony is well inhabited; but the people to the eastward are mostly Arabs, who will not submit to any government, but live by robbery and plunder. For this reason our boatmen agreed expressly with us, that they should not be obliged to go on shore on that side of the river, at any place but where they thought proper; for these men know, that had they gone on shore, they would have been in danger of being robbed by some of those wild roving Arabs.

As we passed by this place, the Arabs called to the master of the boat on shore, to give them some tobacco, who answered, in order to frighten them, that the janisaries in the boat would give them tobacco; but as there was a dinner preparing, and they saw the smoke, they replied very coolly, that the janisaries were dressing dinner, which was unlawful at this time, it being Ramadan, or Lent. This being a sort of menace, we all shewed ourselves in our Turkish habits, whereupon the Arabs retired.

The same day we went on shore on the west side of the river, where we saw a great number of grottoes cut in the hills, which undoubtedly were the sepulchres of people in antient times. All these hills are rocks of petrified shells, consisting of cockles, oysters, and some other flat ones. To the south of those hills is a well-improved spot of ground belonging to a village of Arabs, which stands in the middle of it, called Ceresia; and here are several plantations of tobacco, but it is not good, being so fiery and bitter, that it is difficult to smoke it.

The next day we came to some hills on the east, close to the river, and once a great harbour for all sorts of birds. Here are many grottoes, with a small convent, where we were kindly entertained by the poor monks, but we could not refrain from giving them something in return. In the morning we set sail with a fair wind, and passed another convent, dedicated to St. John, where there were several priests; and a little beyond it, to the west of the river, lies Meloni, a town about a mile in compass, and more handsome than we expected in this part of Egypt; for the houses were decent, and there were several good shops. It is the capital of a province; and there are nine villages subject to it; so that the whole seems a sort of principality, subject to Mecca. The emir, who is commonly one of the great beys, and has the care of conducting the caravans to Mecca, is master of it; and he sends out deputies to govern the country, who live in as much state as the chief governors themselves, and keep the people in the most abject state of slavery.

As this post is very honourable, as well as profitable, so it is commonly given to one of the greatest people, particularly to such faithful slaves as have acquired their freedom by some meritorious action. The country of Meloni is so fertile, that it supplies Mecca with three hundred and ninety thousand sacks of corn annually, which are sent by the way of Cairo, Suez, and the Red Sea. The next day brought us to Akmim, the residence of the deputy governor, whom the Turks call Emir, and his power extends over the whole of the neighbouring country.

This office is hereditary in one family, which came originally from Barbary; and their progenitors managed affairs so well, that the grand signor bestowed these lands upon him, for the consideration of a small annual tribute. Akmim is built in the Arabian manner, only the streets are broader; and here the Franciscans have a monastery, where there is a public apartment, in which one of the fathers attends at a certain hour, to receive converts, and to catechise all such as present themselves, whether old or young.

They reckon about two thousand Coptic Christians here, many of whom flocked to see us the day we arrived. Their bishop entertained us with dinner and supper; for we had brought letters of recommendation for him from Cairo. As for the Franciscans, they first introduced themselves here as physicians; and under that character they have procured a considerable share of respect from all ranks of people.

Our good friend, Malim Soliman, introduced us to the emir, to whom we gave some presents of glass, and were treated with great good-nature and politeness.

This emir was well beloved by the people, and by none more than the Christians, whom he was thought to esteem as superior to the Mahometans: for some few years before this, he had been accused of believing in Jesus Christ, whereupon five hundred soldiers were sent by the basha of Cairo to seize on his person. However, he escaped to the mountains, accompanied by three missionaries, where he remained till he had removed the imputations laid against him. The soldiers having been withdrawn, he returned to his capital, where he has lived ever since, beloved and respected by all his subjects.

Here we met with several remains of antiquity, and on the strictest enquiry it appeared that this place had been formerly adorned with three temples, one dedi-

cated to Pan; another to the Sun; and a third to Perseus. Here are many Greek inscriptions, few of which are legible; and a row of pillars of red granite, that are very fine. Between two neighbouring mountains, in a narrow, steep valley, there is a convent, with a small church; and half way upon a hill that hangs over it, is a cottage, which probably was a hermit's cell during some of the primitive persecutions.

The ascent to it is extremely dangerous, and the way to it in many places blocked up by stones, that have at different times fallen from the top of the hill. Here and there are several little grottoes cut in the hill, in which devout Christians, who attend the service of the church, take up their residence during their travels.

Leaving this place, we passed a village called Sovadgy, where a hospitable Coptic spread a carpet before his door, and, in a manner, forced us to partake of an entertainment of dates, treacle, bread and coffee; nor would he part with us till we promised to dine with him when we returned back. Here we frequently saw courtezans sitting beside the road, but they did not speak to us. The next day we arrived at Der Ambashai, an antient convent, the architecture of which is rather more rich than that of another lying about a mile to the southward of it. It is half a mile in compass, surrounded by a deep ditch; the doors and corners are of stone, and the rest of the buildings are of brick. The north gate is ornamented with pillasters in the Corinthian stile; and on each side is the figure of St. George. The greatest part of the church is fallen down, but so much remains as to shew that it was once a place of considerable grandeur. We had mats spread for us before the door of the church, upon which we had an entertainment served up for us. We lodged in this church during that night, and were regaled with coffee for breakfast.

The monks were so hospitable, that they offered to kill a sheep if we would stay to dinner; but this generous invitation we were obliged to decline, because it was necessary that we should proceed on our journey. We had here an opportunity of being present at the Coptic worship, and saw all their ceremonies on Christmas day; but they differed very little from the Greeks. Malim Soliman treated us with an elegant dinner, consisting of twenty-five dishes, besides some delicacies. The victuals consisted among other things of roast lambs, pigeons, fowls stuffed with rice; but none but myself (says Dr. Pocock) were indulged with a knife and fork. Soliman's son and son-in-law, with others of his relations, waited on us at table; for so great is the subordination of character observed here, that no inferior will by any means sit before a superior, without being pressed to it. A rich cordial was served up, and handed round to every person at table before the meat was brought in; and wine was drank before dinner; this was succeeded by coffee; and then the whole company walked out to Soliman's gardens, after which we returned and supped at his house.

Having hired a boat at this place, we proceeded, accompanied by four seamen, who undertook to carry us up the first cataract, and to bring us down again, for which we agreed to pay them about an English half-crown a day, with a sufficient quantity of provisions; but we afterwards found that these boat-men, like true Arabs, were never to be satisfied.

It was during this excursion that we took a view of Thebes, of which antient city little now remains. Here indeed are still some remains of antiquity, among which is the famous statue of Memnon, which, according to Pliny, was built of the stone basalt; and when struck upon by the solar rays, sent forth certain articulate sounds. Here the country people were much offended because we took the measurement of places, and copied inscriptions; but we were protected by the governor of the province, who on all occasions treated us with the greatest tenderness.

Thebes was one of the most antient cities in the world,

world, and the place where astronomy and philosophy was first taught. The priests were men of learning, and to them we owe the divisions of time into solar months and years. It extended as far as Camac, which is now a poor ruined village, consisting only of a few small cottages, inhabited by peasants. From thence we went to Etfou, formerly called the Great Apollinopolis, and there we found the remains of some ancient temples, which had been erected when Egypt was in her primitive glory. The sheik, or governor of the country, treated us with the utmost respect; but we had many difficulties to struggle with, from the bigoted superstitions of the people. Thus it happened one day, that while we were writing down remarks of what we had seen, a mob gathered round us, and the governor's nephew, a bold young fellow, ran off with our memorandum-book.

The uncle, enraged at such brutal behaviour, flung off his upper garment, and seizing a pike, pursued him; nor is it unlikely but he would have killed him, had he overtaken him; for besides this affront, there had an animosity subsisted long between him and his brother, the young man's father, concerning the sovereignty of the place. However, private intimation being given that a crown would purchase the book, we sent a servant for it with the money, and he brought it back. However, the father of this young fellow obliged him to follow us, and not only return the money, but to beg pardon for his rudeness; an instance of integrity and politeness seldom found among the Arabs. Possibly it might arise from political motives, in order that the dispute which had so long subsisted between the brothers might be adjusted. This is the more probable, because we learned that they were soon after reconciled, and lived in harmony together.

We now approached Haijar-Sibciby, where vast rocks jutting out a great way, confine the current of the Nile; so that it rushes forward with great impetuosity. There was formerly a chain drawn across here to defend the pass; and on the western rock are four niches, adapted to the worship of particular deities; at least we conjectured so, because we saw numerous remains of pilasters, cornices, and hieroglyphics. Here we found ourselves under the necessity of returning, it being extremely dangerous to continue our voyage any longer, on account of the numerous swarms of Arabs that daily infest the eastern banks of the river.

Upon our return back, the boatmen cut down a large tree, but delaying to carry it off, they were in danger of being taken prisoners by the wild Arabs, who would certainly have plundered us, if the boatmen had not instantly returned and put off. Here we found swarms of crocodiles, but they retired as soon as we fired our pieces at them.

Some of these creatures were above twenty feet long; and this great plenty of them is occasioned by the vicinity of the cataracts; for they are endowed with so much intuitive knowledge, that when they come to the fall of the water, they crawl out, and join it again below the precipice. These cataracts of the Nile are wonders indeed; and yet they are far inferior to the descriptions we have of them in ancient authors. Never perhaps did nature present such a prospect as this; on the east side there is nothing but bare rocks; on the west there are hills of sand, or of black slate; above to the south there is a craggy island, commanded by several steep cliffs, and the rocks to the northward obstruct the view of the waters. The channel is crossed in three places by rocks of granite, over which the Nile falling, forms three cataracts. The first is about three feet deep; the second is a little lower, and winds round a large rock, or rather island, which to the north may be about twelve feet high; and they say at high water the stream ran over it; but then supposing the Nile to be five feet higher below the rock, the fall may be seven or eight feet; and to the east and west of it there is a stream which unites, when the Nile is at the highest, with another

stream that runs still more to the westward. This seems to be the cataract described by Strabo, which he says is formed by a rocky eminence, in the middle of the river, over the top of which, being very smooth, the water flowed quickly till it fell over the precipice.

According to him, there was a channel for boats on each side, and this we can only suppose to have been when the western streams just now mentioned were united. Boats sailing over this rock came to the very fall of the cataract, and the water carried them down the precipice with safety. There is another fall to the north-east, lower down the river, and it appears greater than the rest. As to the prodigious cataracts called Catadupes; which, in their fall, made so hideous a noise, that those who lived within the sound, was struck deaf; they do not now exist, nor is there any reason to suppose they ever did.

In our return to Assouan, we met several camels loaded with senna, a drug well known in the materia medica. All that is brought to Cairo, is bought up by some rich Jews, and sold to the European merchants. These Jews purchase the privilege of this trade from the bashas, and no others have any right to meddle with it.

The evening before we left Assouan, the commanding officer of the janisaries, whom they call Aga, sent us a supper of goat's flesh, pibaw, barley soup, and hot bread; and next day, when we were about to depart, he sent us a present of a live sheep, desiring us, at the same time, to deliver a letter and some money, to a certain person at Akmim. This sum of money amounted to about four pounds; but small as that sum may appear in the estimation of the reader, yet the officer would not have intrusted one of his own soldiers with it, lest they should have given him the slip; and, for sake of the shining dust, joined the wild Arabs.

On the 11th of February we arrived at Badjoura, where we waited on the governor, whom we found sitting in company with a Mahometan priest, eating beans boiled in the shells, and we were received with great politeness. He told us he was not in the least surprised that we should have been rudely treated, because all the people there believed that the Christians had no other objects in view besides that of searching for treasure.

The next day we went on shore at Girge, to the south of which city the governor, who had both his seraglios, was encamped, in order to receive us in his tent. He was a man of an engaging figure, and an agreeable aspect; and no sooner did we approach the door of his tent, but a band of music struck up, and we were served with coffee. He wrote us letters of recommendation to all the officers under his jurisdiction, and having entertained us with the greatest hospitality, dismissed us with that complaisance which will always betoken good nature, good sense, and that sort of benevolence, which is not confined to any body of people in the world.

On the seventh, early in the morning, we arrived at Rovigney, where we were kindly received by the governor, who was waiting on the opposite side of the river to receive us; and he conducted us to the famous Grotto of the Serpent. It is a large cleft in the rock, lying in the bottom, between two craggy mountains, and out of it the credulous believe that a serpent often comes. On the right, there is a mosque, with a dome over it, resembling in some measure the burying-place of a Turkish chief. Besides this, we met with nothing in this part of Upper Egypt, except some convents, inhabited by monks, who laboured under the most cruel hardships from the severity of the Turkish government. They were, however, extremely hospitable, and as we knew the nature of their circumstances, so we did all that lay in our power to contribute towards their relief.

February twenty-seventh, we arrived at Cairo, and were kindly received by the English consul, after performing

forming this voyage up to the first cataracts, without meeting with any other accidents than such as have been already mentioned.

Such is the substance of what observations Dr. Pocock made in Egypt; and when we consider his numerous accomplishments, his knowledge of oriental learning, his wisdom in judging of antiquity, and, above all, his integrity, we are glad of this opportunity of making these remarks of his public character. We shall now proceed to lay before the reader the travels of one of the most curious and learned men that this age has produced in Europe. The person alluded to is Frederick Lewis Norden, a gentleman of an honourable family in Denmark, and very much in favour with the late king of that country. He visited Egypt at the same time Dr. Pocock was there, but they had not the pleasure of being acquainted till after their return home. Then it was that a friendship commenced, which lasted till Mr. Norden's death, which happened about fifteen years afterwards.

We shall not go over the whole of his description of Egypt, but confine ourselves to such things as are related by him, not mentioned by Dr. Pocock, particularly his voyage up the Nile, and his journey into Numidia. We shall therefore follow his narrative as closely as possible.

Throughout many parts of Egypt, are vast numbers of obelisks, which for magnificence, and as precious relics of antiquity, ought to be considered as next to the pyramids. The matter of which they are made insures them a long duration. They are commonly made of granite, which greatly enhances their value, for it is very difficult to procure pieces so large as to compose obelisks. They seemed to have been designed as portals before temples, or sometimes to add additional grandeur to colonades. They are quadrangular to a certain height, and in a pyramidal form; then rising up, they are contracted into a point, and crowned by a pyramidal summit. Vast numbers of figures are carved upon them, but the great misfortune is, we are not now able to read them.

And here it is necessary to observe, that so far as we know, there are no obelisks as remains of antiquity to be found any where but in Egypt; for as to what we meet with in other countries, they have either been brought from Egypt, or are at the best faint imitations of them. All the obelisks are not of the same height, but sometimes they differ in form. In some of them the summits are wanting, nor have they been all made by men of the same taste. From one end of Egypt to the other, we met with obelisks, for we saw them at the city of Alexandria, and again at the extremity of the country. In the island of Giesirelle-Hief, we saw two obelisks of white marble, but neither of them had any figures upon them. Indeed they are so numerous, that it would be impossible to describe all of them, so that we shall confine ourselves to our journey through this part of the world.

At Cairo we were obliged to stay above three months, which forced delay proceeded from several causes. The first was occasioned by a revolt, which had thrown the whole nation into a state of confusion; every one of the rebels who had the misfortune to be taken, was instantly put to death; but still there was a vast number left, who joined themselves to the Arabians. The chief of these was named Salem Cochef, who having withdrawn, and married the daughter of an Arabian prince, it was industriously propagated that he was killed. Strengthened by this alliance, he robbed and slaughtered all that came from Cairo; so that it was equally dangerous to undertake the journey with the caravan by land, or go by water up the Nile.

The second impediment was a sickness with which some of us were seized in consequence of our imprudent neglect in not taking proper care of ourselves in time, before the malady gained ground. This disorder was a sort of inflammation of the lungs, attended with a fever and the most acute pains. It was so violent,

that it confined us to our beds upwards of two months; but at last it abated of itself, for we had not the assistance of a physician.

After all these difficulties, we resolved to proceed, and for that purpose hired a barge to carry us to Elluaen. We agreed with the barge-man, that if he would not take in any passengers besides ourselves, we would make him a present of a new coat, for our company was enlarged by the addition of a Coptic priest, and two Romish missionaries. One of these missionaries was to us a valuable acquisition; for he was a perfect master of the Arabian language, and being a man of real integrity, joined to sweetness of manners, he was of great service to us, as an interpreter.

We entered into another agreement with the barge-master, namely, that besides our baggage he should take no merchandize on board, lest that should prevent us from making proper enquiries into the nature of such curiosities as should happen to fall in our way. But he had been beforehand with us, and got secretly on board whatever things he had a mind to carry; so that after some debate, we were obliged to submit to be imposed on by a designing knave, as most of these men are.

On the 17th of November, 1737, we embarked about four in the afternoon, but our barge-master not coming on board, we did not during the whole afternoon proceed above five hundred yards. At last he arrived, and we proceeded up the Nile in our barge. And here we shall lay before the reader an account of every thing that happened to us during this painful excursion, and likewise an account of every thing we saw. Indeed this is the more necessary, because, as we were employed by his Danish majesty, nothing certainly was more reasonable than that we should give a proper account of whatever happened, to our royal and munificent patron.

Monday, November the 18th, our barge-master came on board, and we sailed immediately. The first place we saw was Dereminna, where the Coptics have a convent. About a mile higher we cast anchor, near which place there was a Turkish mosque. Here we anchored, and next day proceeded up the river, seeing several Coptic convents and Mahometan mosques on the west side, for there are but few on the east, because of the continual depredations committed by the Arabs.

The first town of any note we arrived at was Bafatin, where there is a very elegant mosque, and there is likewise a synagogue for the Jews. The houses are built of unburnt bricks, the streets are not paved, and in general there are but few things that merit a particular description, only that the country around is fertile, and the prospect of the river is delightful.

About two leagues further, we came to Ebbkabaka, a fortress situated on a high mountain; about four miles from the eastern banks of the Nile. Here we found a Turkish garrison, and a mosque for public worship; but there is nothing remarkable in the situation but its romantic building. Opposite to this on the western banks of the river is Manjelmufa, a village ornamented with a mosque, and near it is a grand pyramid five stories high.

Continuing our progress up the river for several days, we passed many agreeable villages situated on rising grounds, and surrounded by fine plantations.

Sakkara is a considerable town, in which there is an elegant mosque, and this seems to have been a place of great antiquity, on account of the vast number of mummies that are constantly dug up in its neighbourhood. Here likewise is a famous labyrinth, in which birds, beasts, and other animals were deposited after they had been embalmed. Here are several pyramids near this town, and the first of them is composed of four stones terminating in a point. The second differs but little from those at Memphis, and is pretty near of the same height, but has been greatly damaged through the injury of time. As this place is almost unfrequented by strangers, the canals of

the pyramids are full of sand, which is almost an insurmountable difficulty for those who would desire to go into them.

The third, which is somewhat higher than the second, is singular in its figure; and although unopened, it appears to have been much more damaged than any of the rest. Perhaps it is of greater antiquity than any of the others; for unless we grant that, it will not be an easy matter to account for its singularity; especially as it does not appear ever to have been covered with granite.

Meduun, a large village, is situated on the western banks of the Nile; and near it stands the most southern of all the pyramids of Dagjour; and, so far as we could discover, the most southerly in all Egypt. It is built of bricks, dried in the sun; but still it is extremely beautiful. It has been so well preserved, that one would imagine it never yet received any damage. Indeed it owes much of its fine appearance to its situation on a squared hill, whose four sides being smoothed, are so exactly adapted to the base of the pyramid, that to the eye, at a distance, they seem to be but one body.

This day we were so becalmed, that we were obliged to come to an anchor near a most beautiful plain, covered with Turkish corn, which was then perfectly ripe. In the evening we were pestered with bats, who hunt for their food on the surface of the Nile; and during the night we were obliged to keep watch, and fire a musquet every hour, to let the Arabs know that we were not afraid of them; and this was so necessary, that we were obliged to do so every night during our journey, whether we had any apprehensions of danger or not.

The calm continuing all that day, we were obliged to remain there, and saw above one hundred barks from Upper Egypt, sailing down the current in their way to Cairo. Our leisure time we spent on shore, and killed a great number of pigeons; but they were so old and tough, that when they came to be dressed, we could not eat them. This disappointment, however, was made up by our shooting a vast number of partridges, whose flesh was very delicious.

November 22, there was not a breeze of wind in the morning; and in the afternoon a strong gale sprung up from the south, which confined us to the spot we had been at before. After this succeeded a calm; and then a breeze from the north-west, and we hoisted sails to make the best use of it we could; but it soon failed us, so that we were obliged to have our bark towed against the stream. This stratagem, however, was of little avail to us, for notwithstanding all our efforts we made but little way, and therefore resolved to fasten our bark to the eastern banks of the Nile, till we could find an opportunity of proceeding farther.

November 23, a dead calm still continued, and we went on shore in order to procure some provisions; but finding none, we returned on board as empty-handed as we went. Soon after this we were enabled to make sail by means of a weak, north-westerly wind; but it was soon spent, and we were obliged to use our ropes until mid-day, when the wind freshened enough, not only to drive us below it, but even to break our fore-mast yard. This accident obliged us to return to Saleheie; where, whilst another yard was getting ready, we laid in provisions for several days; we immediately after sailed, but had scarce made a league, when a violent north-east wind obliged us to come to an anchor at a small place called Giesret Euleg. It is situated on the eastern banks of the Nile; and there is a village on it with a mosque; around it are a vast number of fine plantations, from whence there are beautiful prospects. These villages are somewhat enlivening to travellers, because they serve to diversify the scene, and present to the eye a variety of different objects.

November 24, early in the morning, we went to visit the pyramids already described, but could not learn much more concerning them. At our return we were visited by the governor, who brought us a present of two sheep, three fowls, one hundred eggs, and a ham-

per of bread. In return, we complimented him with some wine of Cadia, and other sorts of liquors, which he received with the greatest politeness. He knew something of us, having spent several days in our company while we were at Cairo. Having taken leave of him, we set sail again about ten o'clock in the morning, but it rained incessantly, and there was little wind. About noon we passed by Komgeride, situated on the western banks of the Nile, a large village, and which was in antient time a very flourishing city. Little remains of its antient grandeur are now left, nor indeed any thing worth notice except a mosque, and some tolerable good houses; during the rest of the day we continued sailing up against the current of the river, and every where we saw villages on each side, most of which were inhabited by Arabs; but the men were gone on excursions into the interior parts of the country; so that we had no reason to be afraid of them.

November 25, having provided fresh provisions, we set out for Beneforef, where we met with several boatmen, whose barges were lost in the water, in their return from the cataracts to Cairo. During the whole of this day, we passed a great number of villages, and all of them were well inhabited, there being vast numbers of people in them. The same day we passed by Deir, where there is a Coptic convent, dedicated to the Virgin Mary; but the antient building having fallen to decay, the present structure consists of little more than wood. Here are a vast number of ruins, some of which seem to have been grand structures of fine stone, but so defaced, that it is in a manner impossible to discover, by any marks, at what time they were built.

According to the traditions of the people, they are the remains of some buildings erected by the Magi; and this is not at all improbable, when we consider that these Magi were no other than a sort of astronomers who resided somewhere in Arabia.

There are stairs artificially contrived in the rock, which lead down on the north side to the Nile. There is also to be seen a kind of aqueduct to convey water from the Nile, which is drawn from thence by means of a machine. It is a piece of very great antiquity, and is composed of large stones. At the bottom of the rock we attempted to go up the stairs, but found it dangerous, on account of the vast number of loose stones, which frequently tumble down.

We continued sailing up the river till towards evening, and should certainly have kept on all night, had it not happened that our bark struck against a sand-bank, which put us to much trouble to get it off. The whole of this day we observed that the bed of the river was gradually becoming more and more narrow, having fine cultivated fields on the west, but barren mountains on the east.

November 26, we continued sailing, having a very favourable wind, and pleasant weather; and passing several villages, came to Menie, which is reckoned half way between Cairo and Girge. Such vessels as sail down the Nile to Cairo, are obliged to land at Menie, and pay some tribute, for which purpose a collector resides near the spot. The town is large, and has several mosques, with some remains of antiquity.

The same day we passed by several villages, and came to Schechabade, formerly called Antinoe, and capital of the Lower Thebaid: it contains several antiquities, wherein some of the enormous stones used by the Egyptians in their buildings are to be seen; but stones of a moderate size, are such as were used in constructing triumphal arches, not only at Rome, but also in the conquered provinces.

The principal things worth notice among the ruins, are three good gates. The first is ornamented with columns of the Corinthian order, channelled; and the two others, which correspond with the first, are plainer. These ruins of antient Antinoe are at the foot of the mountains, bordering on the Nile. The walls of the houses have been built of bricks, which look as if they had been much burnt, for they are as red as if they had been newly made.

About

About a mile above this place, is a convent for Coptic monks; but they are not only poor, but extremely ignorant.

November the 27th, the weather being fine, and the wind favourable, we sailed all night, and passed several delightful villages. It was near this place that the ancient Hermopolis stood, which was reckoned one of the most celebrated cities in Thebais; but there are not any remains of it to be seen, not even a stone or a pillar.

A league farther on the same side, and about a mile from the river, is the village of Galanish, and here there is no such thing as passing without fire-arms. The Arabs of these parts are professed pirates; and despise all sorts of government. We were informed, that one day the governor sent thither his bark to demand the head of the captain of the pirates; and they, to amuse him, cut off the head of a Christian slave, which they sent him, telling him at the same time, that it was the head of their chief. The governor's servants were not strangers to the trick imposed on them, but they concealed it from their master, for which they were afterwards severely punished.

A few hours more brought us to the village called Ell-kgufuer, where the Coptics have a convent, and here the mountains are so near the river, that it is not an easy matter to get along. In them are a number of caverns, some large, some small, whither the labourers used to retire when they refreshed themselves after digging in the quarries.

There are perhaps no mountains in the world that give such evident marks of the deluge as these; for one may see the impressions made by the water during that awful event.

Near the river are vast number of grottoes, which during the primitive persecution, were the retreats of pious hermits; but they are now inhabited by Arabian robbers, who infest the Nile. These Arabs have a nominal governor, but they pay no more obedience to him than they think proper. Nor do they pay any more regard to the Turkish government, for although the janisaries often attempt to chastise them, yet they know where to shelter themselves in the mountains. At this place we saw a dozen of barks belonging to these Arabs, fastened in a creek, which the Nile forms at the feet of the rocks.

About three miles beyond this place, stands Monfalunt, and is the capital of a province of the same name. It is situated at a little distance from the river, and from the numbers of their mosques the appearance is grand and majestic. There is a Coptic bishop here, the generality of the people being of that persuasion; but his church is a poor edifice. The country around it is very fertile, producing almost all sorts of fruits; so that the inhabitants have all the necessaries of life.

There is one thing necessary to be attended to by those who sail up the Nile, and that is, not to take any articles of merchandize along with them; for if they do, they are not only exposed to many inconveniences, but are obliged to pay double taxes, as we were, both here and at other places. Opposite to this city, eastward of the Nile, is a convent of Coptic monks, absolutely inaccessible by any other means than that of letting a man down, and bringing him up again by a pulley in a basket. Near these mountains dwells an Arabian chief, who governs his subjects, and cultivates his lands, without paying any regard to the basha of Egypt, whom he sets at defiance.

This day we saw a crocodile, which seemed to be about ten feet long, but no sooner did we fire at it, than it ran away into the river.

November the 28th. For want of wind, we were this day obliged to have our barge towed along by four sailors; which was a painful job for these poor fellows, the weather being extremely cold, and their cloathing very thin. Our barge was run a ground several times, and in the afternoon we doubled the point of Siut, an ancient city, adorned with a great number of mosques, which give it a most graceful appearance. Here a governor resides, who is subject to the basha of Egypt;

and a Coptic bishop resides here, but he has a poor scanty subsistence. There are many grottoes in the mountains here, but many of them are in a manner inaccessible, the rocks being so steep, that there is scarce any possibility of getting to them. It requires full two hours to ascend the mountains, and the danger is so great, that few will attempt to undertake it. There are several tombs, in which it is reasonable to suppose that some of the ancient hermits were buried; for these poor afflicted men were obliged to submit to be buried in the very cells where they lived.

On one part of the mountain are seven springs, which the people call the seven chambers; and there is an old tradition among the Turks and Arabians, that these seven chambers were formerly inhabited by seven virgins. But be that as it may, certain it is, that these grottoes have something in them which points out that they were first made by no ordinary persons. That they were the habitations of hermits, cannot be disputed; but that they were built by hermits, is ridiculous to suppose. The truth, so far as we are able to form any notion, is, that these grottoes were first cut out of the rocks, by some persons of great eminence, who, driven by lawless powers, left their peaceable habitations, and sought refuge in these inhospitable deserts. Here the wild wandering Arabs swarm in such numbers, that a traveller is continually in danger. The prospects from the river at this place are in a manner past description, and we could have dwelt days together upon it with pleasure; but night came on, which brought us to the village of Sachet, in the environs of which are several beautiful canals made in ancient times, but none of them merit a particular description.

Towards morning we were becalmed, and the current running very strong against us, we were obliged to lay at anchor all day. A Coptic priest, whom we had received into our barge at a small distance from Cairo, took his leave of us, and we were extremely glad of his absence; for although he appeared to be a poor silly fellow, yet his presumption was so great, that he told us several times he did not believe we were Christians; and all this because we would not kneel down and kiss his hands, which is the common practice among the Coptics.

Our people went on shore in order to get some necessary provisions, and they killed a wild-goose with a considerable number of pigeons. The different tribes of the Arabs were then at war, and they slaughtered each other without mercy; but no insult was offered to us. We saw several of these Arabs reaping in a field; but they had so little regard for their future subsistence, that they seemed to cut down the corn only as fodder for their horses. The truth is, they are so idle, and so averse to labour, that they pay little regard to any thing beyond the subsistence of the present day; for their whole food is, in general, procured by plundering the country-people, and robbing the caravans going to Mecca.

November 30th, the calm and the strong current still continuing, we were obliged to lie by all day in the same place, and in the morning we went to Neckeele; not only to see the place, but also to buy such provisions as we wanted, that being their market day. This is but a poor village, and yet we found every thing requisite for our use in the market. To this market the poor country-people resort in great numbers, and bring along with them a few hens, and two or three hundred of eggs. There is one advantage attending this market, namely, that every proprietor is obliged to sell his own goods, and this prevents forestalling and engrossing, which is so common in Europe. Money is scarce with them; but as that is only the emblem of riches; they take goods in return for those they dispose of. During the whole of this day our people, who went into the fields, had exceeding good fortune, for they killed a great number of wild fowl, which they brought home to us, and we regaled ourselves on them in the most delicious manner. Indeed if it was not for these wild fowl, it would be no easy matter to procure any sort of provisions in this place; but those who have fire-arms, need never be in fear of going without them.

December the 1st, a gentle gale arose, and by its assistance we were just able to make sail, and by eight in the morning we came to Abutitsche; a considerable city on the western banks of the Nile, where there are several mosques, which look extremely well at a distance. From this place we continued sailing up the Nile; and every-where the banks of that celebrated river seemed to be covered with villages. It was in this day's excursion that we came to Diospolis, now called by the inhabitants of the country; Gauscherkie. Here are some remains of antiquity, particularly an antient temple, sixty paces in length, and four in breadth. The ceilings are well preserved, and on them are still to be seen many hieroglyphicks. But as this place is in possession of the wild Arabs; they pay little regard to it, but make it a stable for their horses. The sides of the temple are open, but still it retains some marks of great antiquity. Near it are the remains of several canals, which seem to have been cut out by some of the antient Egyptian kings, and most of them have had stone walls in the inside to prevent the earth from falling in; but the rapidity of the Nile has carried off many of these remains of antiquity.

December the 3d, we rested here all that day, and our barge-master went on shore in order to lay in a fresh quantity of bread. Bread is not to be had here ready made, so that those who want any are obliged to observe the following method. They go to the market and buy corn, which they carry to a horse-mill to be ground; but when it happens that this mill cannot dispatch it soon enough, being engaged to other customers, then they parcel it out in small quantities, and get the people to grind it with hand-mills, there being seldom a house without one. After they have got the flour, they give it to the women, whose business it is to make it into bread; and this they soon execute, although their baking implements are not the most commodious, nor in the best order. Their ovens are remarkably little, made of mortar, and heated with straw; but their bread is pretty good, although made in the Arabian manner. They make the dough very soft, nor is there ever any complaint of the bread being over baked. Their cakes are generally good when eaten new; but when they are kept only one single day, they are so nauseous, that few besides the natives can use them.

We went to see the market-place, and found it better stocked with provisions than we could have imagined. This plenty is in part owing to the great numbers of barges that are continually passing, and this gives it the air of a commercial city. All sorts of poultry, mutton, and vegetables, are brought from the neighbourhood, because the peasants are sure to meet with customers. Every thing there is sold very reasonable, nay more so than we expected. We bought the sucking calf of a buffalo for about sixpence, and poultry with all other necessaries in an equal proportion. This place is celebrated on account of a sort of conserve made in it, highly esteemed both by the Turks and Arabs, on account of its sweetness.

As we walked along the market, we met two of their pretended saints; they were stark naked, and ran up and down the streets like madmen, striking their heads, and roaring as loud as they could.

The next curious figure was a common woman of the town; her face and breasts were exposed; the smock she had on was white, whereas those worn by modest women are blue. Her head, her neck, her arms, and her legs, were decked with a variety of trinkets; but all those ornaments did not so strongly mark her character, as her impudent air, and lascivious gestures. And what was rather remarkable, she was so ugly in her features, that we could not conceive how any person would be tempted by her.

In this town near the mosque, is a large burying place, in which are several monuments erected in honour of some illustrious persons. This mosque and burying ground are situated so far remote from

the Nile; that the waters of that river cannot wash away the remains of the dead. The Coptic Christians are much more esteemed, and treated with greater respect here, than at Cairo; and they also enjoy several valuable privileges. They are not afraid to strike a Mahometan; which in other countries, where the Turkish government is more severe, would cost them their lives.

December 4. Having spent two days at this place, and taken in all sorts of necessary provisions, we sailed about eight in the morning; and soon passed several delightful villages, situated near the banks of the river. Our bark stopped at Girge; and we went on shore to visit this city; which, considering its situation, and the nature of the civil government; is extremely populous. Here the governor of Upper Egypt resides; for this is the capital of this part of the kingdom. The Turks have several mosques here; and there is also a church, the residence of a Coptic bishop.

There are also Franciscan friars here, but they make but few converts; most of their time being spent in the practice of physic; and as most of them are men who have acquired some school learning; so they make a very considerable figure, and are treated with great respect both by the Turks and Arabs. Several sums of money are paid them annually; and it may be said of them, that they live in plenty and ease.

December 4, we sailed from Girge early in the morning; but towards evening we were becalmed; we sent some of our people on shore to procure wood for fuel, and desired them to meet us some miles higher. We kept jogging on very slowly, by reason of the little wind we had; and here we passed by a prodigious range of mountains, called Schearaque, and part of them reaches to the banks of the Nile. There are many villages among them, all inhabited by Arabs, and all subject to Arabian chiefs. They consider themselves as intirely independent of the Turkish government; and all such persons as have committed crimes at Cairo, are sure to find an asylum here, no person, not even the Turkish janisaries, daring to follow them into those mountains.

The next place we arrived at was Bardis, a handsome city embellished with a fine mosque; and on the south side of it is a fine canal, which runs a considerable way up into the country. It is surprising to think what vast numbers of villages are scattered up and down the banks of the river; they making in appearance to the traveller, what the antients called a rural city.

Here we met with vast numbers of sand-banks, which put us to many difficulties to get past them. Bagjura, an antient town, embellished with a mosque, is situated on the banks of the Nile; and here we were joined by our companions, whom we had left behind to get wood. They brought along with them a sufficient quantity, which was of great service to us, we having none left on board.

While we were at Bagjura, fifteen janisaries came to our bark, and demanded a passage; our barge-master refused to admit them, alledging for a reason, that we had hired the barge, so that we ought to have it to ourselves; nor would he permit them without our consent. The janisaries only laughed at him, and told him, that if any one opposed their coming on board, they would force their way. In the mean time I hinted to the barge-master to put off, which he did; so that we were delivered from very perilous company, and probably from very dangerous consequences, which would have taken place, had we admitted these unwelcome visitors on board.

December 6, we sailed all that night, and passed by a great number of villages, till we came to Schaurie, where we found ourselves once more becalmed. Some of our company embraced that opportunity of going on shore to view the ruins of a temple in the neighbourhood. But being informed that there was then a convention of three or four hundred Mahometan saints, attended by an almost incredible

numerable multitude of people, we thought it most prudent to desist. Here we met with a janisary, who begged we would let him embark on board our vessel, which we readily granted; for although it is rather dangerous to be in company with too many of these soldiers, yet one or two sometimes becomes useful. This janisary was attempting to make his escape for having killed one of those fifteen janisaries whom we have already mentioned. He seemed to be a brave fellow, and was several times of great service to us, when we were occasionally insulted by the Arabs, who were sure to come up to us wherever we came to make some remarks on antiquities.

During the whole of this day's voyage, or rather journey, we found the Nile very irregular in regard not only to its turnings, but also in respect of its breadth. The bottom was very clear, so that we passed with ease by several villages on our left, and an equal number on our right. Here we saw several crocodiles stretched on the sand, where the fall of the water had left them dry.

Passing several other villages, we came to Dischne, a name which signifies Admiration, and was given to it for the following reason:

Some Arabs being on a voyage up the Nile, came to this place, and were very much embarrassed to know towards which side they should turn when they had a mind to pray; for the Mahometans always pray with their faces towards Mecca. In the morning they saw the sun rise on their right, which so much astonished them, that they gave the place the name of Admiration.

About eight o'clock in the evening we were becalmed, and being in danger of being driven back by the current, we anchored on the eastern shore of the river, along which is a barren plain, extending a considerable way in length.

December 7, some of our people went on shore, in order to shoot wild fowl, but all they could get was about a hundred sparrows, which were so bitter to the taste, that it was with much difficulty we could eat them. At eight in the morning we quitted this place, and soon after arrived at Dar, on the eastern bank of the Nile. About two hours afterwards we arrived at Dandera, which, without doubt, is the antient city Tentyra, so often mentioned by Strabo and Pliny; we were informed that there was still an antient temple to be seen in it, and we had a strong inclination to visit it, but there was no persuading our barge-master to put us on shore. The city of Dandera is very pleasantly situated on the banks of the Nile, having the appearance of a vast number of villages joined together; there being every where fruit-trees and gardens.

At two in the afternoon the calm obliged us to come to an anchor a little below Kiene, a city, which, although not very considerable at present, yet has a mosque, with several other buildings. Great commerce was formerly carried on here, there being a road extending to the Red Sea, which is only three days journey across the desert of the Thebaid; but that road is now infested with robbers, and wandering Arabs; so that no man can attempt to travel over it without exposing himself to much danger.

Having read much of the antiquities of this place, we went in search of them, but could not find any; nor could the natives of the place give us any information.

In vain did we look for the course of the antient canal, by which goods were conveyed to the Red Sea and back again; we could not discover the least vestige of it, either in the city or its neighbourhood.

Here is an annual festival, at which the governor of the province, with all the Arabian chiefs, attend. There are several ponds in the neighbourhood, supplied with water by the inundations of the river; but it is rather brackish; so that the people use it for their gardens and inclosures. Almost all sorts of plants were growing near the city, but we saw no corn;

probably because it had been cut down; and these plants were a second crop.

December 8, we had set sail the evening before, and during the night passed several villages on both sides of the river. Here the river begins to turn and wind exceedingly, and we continued in our course till we came to Nagadi, a considerable city, in which are several mosques. As soon as we came to an anchor, the Arabian prince sent an order to our barge-master to come on shore and give an account who were the persons he had on board.

The barge-master answered, we were merchants, who had letters of recommendation from the basha at Cairo. The prince told him he did not believe him; for he had heard we were persons who had some hostile intentions against him and his people. That we might give him the utmost satisfaction, we sent one of our attendants to him with a letter from the basha, at which he seemed much surprised, but did not give us any farther trouble.

There are a great number of Coptic Christians in this city, where they have a bishop; but they are far from being good-natured or obliging to the Europeans. We resided all night in this city, and part of the next day, without seeing any thing remarkable.

December 9, we were harrassed that day by a mob of Coptic Christians, who had drawn along with them a large croud of Arabs: they ranged themselves against our bark, and at first seemed to contemplate us with great surprise; but finding that we made no efforts to disperse them, they became more insolent, and had even the assurance to come on board and rumage our baggage. We could not imagine what had occasioned all this, especially as we had not met with any thing like it before; but as soon as our barge-master came on board, he explained the mystery, declaring that these troublesome visitors, on seeing our kitchen utensils, concluded that they were all filled with gold or silver; and that all the tin, copper, pewter, and brass utensils, were made of these metals. He added, that a general rumour had been spread among them, that we had immense treasures; so that it was not safe for us to proceed any farther up the Nile.

He then proposed that we should return to Cairo, telling us at the same time, that both himself and we were in danger of being murdered, that they might make themselves masters of our treasure. The poor fellow, struck with this panic, continued to beg that we would return to Cairo; but we were deaf to all his intreaties. By way of encouragement, we told him that we feared nothing, being well armed; that no person should injure him, but at the immediate peril of his life, and that we were absolutely determined to go up as far as the cataract. Our intrepidity, and repeated assurances of defending his life, as well as our own, revived him a little; and his answer of consent was, "God grant it."

The truth is, these Coptic gentry did us all the injury they could, for ever after that we could not land any where without being surrounded by crowds of them, who demanded money from us; and when we could not comply with their illegal demands, they treated us with the utmost indignity.

In the afternoon we came to Gamola, a large village on the west side of the river, where there was a small island with four crocodiles lying on it; we fired at them, and two instantly plunged themselves into the water; one seemed to be without any motion; so that we concluded we had killed him, and went on shore properly armed, to try whether he was dead or alive; but when we got within fifteen paces of him, he dived into the river. He was about thirty feet long, and all the other parts of the body in proportion. The same day we saw above thirty crocodiles, all stretched on the sand, and in general they seemed to be from fifteen to fifty feet in length.

December 11, we passed several villages, none of which contained any thing remarkable, only that they were agreeably situated on the banks of the river, and surrounded

surrounded by inclosures of well cultivated ground. At last we arrived at Carnae, where there are ruins, extending above three miles in length, and as much in breadth. It was about four o'clock in the afternoon when we first discovered an obelisk, on the east side of the river; and a little after we discovered a vast number of ruins, huddled together in the most indiscriminate manner.

From these ruins of antiquity, we began to imagine that this was no other than the antient Thebaid; but our barge-master would not consent to put us on shore. He did not here plead his fear of the Arabs, his only excuse was, that there were so many sand-banks, windings and turnings, that there would be an utter impossibility for us to land. He swore by his beard, in the Turkish manner, that there was no possibility of going on shore there, without fetching a large compass round about, which would much obstruct our passage.

December 12, towards the evening, we had our bark made fast on the west shore of the Nile, over-against Carnac, which is about four hundred miles above Cairo. In the morning we got up to see if we could not discover some remains of the antient Thebes, and we had not proceeded far when we met with two pillars of great magnitude. Encouraged by this discovery, we returned for fire-arms, but our barge-master perceiving our danger, said all he could to dissuade us from it. Nay, he swore again by his beard, that if we went, he would return home with his barge, and leave us to shift for ourselves; we threatened, that if he should act in such a manner we would certainly castrate him, and make him pay dear for his insolence.

This threat had the desired effect on him; for he changed his note, and humbly begged that for his sake, we would not land; "For (said he) if your good fortune make you escape from danger, you expose me to the greatest perils hereafter; for whenever I shall have occasion to sail up this way, and go on shore, the inhabitants will fall upon me unmercifully, for having brought strangers into their country, to carry away immense treasures from them."

We were too much used to such arguments to pay any regard to them; and the poor janissary, already mentioned, whom we had taken on board, threatened to kill the barge-master if he did not comply with our request.

Accordingly we went on shore, and traversed the country about three miles; but we found ourselves greatly interrupted by a vast number of canals, so that it was a considerable time before we reached the two colossuses which we had seen before. The place whereon they are erected is about three miles from the Nile, in a sandy plain, reaching to the foot of the mountains; and about two hundred paces to the eastward are the ruins of several statues, broken down; and about a mile from them, more to the south, are vast piles of other ruins.

The colossal figures, or rather pillars, look towards the Nile. The one represents a man, and the other a woman, their dimensions being similar; but their size prodigious. They are full fifty feet from the base of the pedestal to the summit of their heads. The bases upon which they are seated are square stones, fifteen feet high; and these are succeeded by smaller ones to support them. The distance from one statue to the other, is twenty-one paces. Their breasts and legs are carved with inscriptions, some of which are in Greek, and others in Latin; but these are of a much more earlier date than the statues themselves, having been engraved upon them towards the decline of the Roman empire.

A little to the north of the statues, are the remains of an antient temple, which undoubtedly was that dedicated to Memnon; and the portico alone is sufficient to give us an idea of the antient magnificence of the Egyptians. All the capitals of the pillars are adorned with hieroglyphics; but it is almost impossible to discover what is meant by them. Two sorts

of columns are to be observed in this edifice, and their thickness and solidity gives them a fine appearance to a traveller at a distance. The colours in the painting are extremely grand; and it is surprising to think that they should have resisted the violence of time for so many centuries.

We observed that the hieroglyphic in those buildings had not the same appearance with respect to antiquity, as some that we had seen in other places, nor was there that exactness of proportion; for which Greek and Roman statues have been so long celebrated. On the inside, on the western wall, leaning towards the north, are three large figures; with the faults already mentioned; and they seem to have been designed to allude to the fall of our first parents. There is the representation of a green tree; and on the right side of it a man sitting, who seems with an instrument in his hand to defend himself against a little oval figure, covered with hieroglyphics, which is offered to him by a woman, standing on the left side of the tree, whilst with the other he accepts the present. Behind the man stands a figure, the head of which is covered with a mitre, and stretching out a hand to him. We could find no connection in the rest, most of the figures resembling amorous devices, or rather the representations of heroic achievements.

But to return to the architecture of the edifice. It is to be observed that on the east and west side there is a wall that serves for an inclosure; but on the north and south are two colonades. The exterior columns are neither so high nor so well proportioned as the middle ones; for they are without capitals, which disfigures them much. There ought to be twenty-one columns on each side; but on the north a great many of them are broken down. Those in the middle being the tallest, raise the platform much higher than the galleries. There is no possibility of seeing the floor, it being covered with ruins and dust, to the depth of four feet at least.

About fifty paces from this edifice are several other remains of antiquity, which seem to have been a gallery, running all round the court; and they are the more worthy of notice, as they are undoubtedly the remains of an antient pagan temple. Each of the pilasters is adorned with inscriptions and figures, and some of these represent men holding books opened in their hands, which shews that they are not of modern date, but were raised by some of the antient Egyptians.

These great blocks of stones cover the pilasters; and upon them are several inscriptions. Behind the gallery is a wall, in a very ruinous condition, and it seems to have been contrived in order to shelter the people from the heat of the sun. There are also two pilasters, too far separated from each other to have been covered; and from this circumstance we may learn, that if this was the place where Memnon's statue was erected, it must have stood uncovered in the open air; which appears the more probable, as it could by that situation better receive the rays of the sun.

Here we saw the remains of an antient statue, half buried in the ground; but we could not discover its proper attitude. The upper part is wanting, and seems to have been purposely broken off, as appears from several marks upon it. On what remains there are a great number of figures, but they were so much defaced, that we could not make any thing of them. All these concurring testimonies seem to point out that we must look here for the antient temple of Memnon. It is certain that no notion can be formed of any place so much resembling what has been said by antient authors concerning it; but with respect to that point, we shall leave the critics to determine.

It is well known that most of the antient authors have entertained us with an account of the statue of Memnon uttering articulate sounds when the sun's beams shone upon it. We struck the remains of this figure several times; but it made no other sound than what is produced in consequence of striking a block

of solid marble. It is true there is an urn in one of the pyramids that sounds like a bell, but then it is necessary to consider that it is hollow.

There is another statue here much of the same dimensions as that already mentioned, but it is thrown down, and lays flat on its face, so that we could not form any proper notion of it. At a little distance from this place we saw another statue carved in the Egyptian manner, two feet high, and made of granite, in the real antient taste, executed with great art and elegance, and has something so pleasing and simple in it, that we were convinced it must have been the work of some elegant master. All the other remains of this celebrated place are now buried in ruins. This indeed is not to be wondered at, when we consider what a vast number of years it is since this city was built, and how often it has been besieged by foreign enemies. When we had seen all we thought worthy of our attention, we took the road leading to the mountains, and visited several caverns and grottoes.

From thence we came to Medinet Habu, a city built out of the ruins of the antient Thebes, and about two miles northward of the Nile. Here we saw the remains of an antient portal facing the Nile, and although it has stood a great number of years, yet it is still in fine preservation. We got over some little hills, made of the ruins and the sand, and came to a square that seemed to be a sort of an antechamber, built with large blocks of white stone, each as high as a man. Some remains rising above the ground are yet to be seen, and the uppermost part is a plain cornice. Over-against the portal is a pretty large opening, and on each side of it a fragment of a wall, covered with hieroglyphics.

This square does not terminate at the portal; but at the walls of the antient city, some remains of which are still to be seen to the northward. The face of the square has no cornice, and the piece of a wall near its aperture is covered with a vast variety of figures, or hieroglyphics, but they are so much defaced, that very few can understand them.

About a dozen paces further are two columns made of several large stones, without any inscriptions upon them; but their channelled capitals are intermixed with colours very pleasing to the eye, though not executed according to the rules of any order of architecture. Having passed the columns, we were obliged to climb over several large blocks of stone that obstruct the passage to the portal. All the rest of the antiquities here contain marks of grandeur, and very probably some of them are as old as the time of Moses. There is indeed one circumstance not taken notice of by any of the travellers who visited Egypt previous to our going into that country, and that is, the situation of the land of Goshen. There is great reason to believe, and the notion is supported by tradition, that this spot of ground was not far distant from Cairo. But then there are two things to be considered, First, a small piece of ground was sufficient to accommodate Jacob's family, consisting only of about seventy persons. Secondly, no reasonable thinking man will believe that the kingdom of Egypt was then so populous as it was at the time when Moses was born. We are told that when the children of Israel came out of Egypt, they were six hundred thousand in number, besides women and children; and in this account there is nothing at all improbable, seeing they had been there two hundred and ten years. But how could the small local territory called the land of Goshen, contain such a number of people? was it not therefore more probable that they would emigrate into those parts of Upper Egypt which we have been now describing? To this sentiment there are two objections which we shall fairly state, and answer with candour.

First, it is said that the children of Israel were condemned to work as slaves in building cities; and from the circumstances attending the birth of Moses, it appears that their residence must have been near the city now called Cairo.

To this it is answered, that we are no-where in scripture told that the children of Israel were confined to one particular spot after the death of their great progenitor; for as they increased in numbers, consequently their local territory must have been larger than before. Is it not therefore reasonable to suppose that many of these people went into Upper Egypt, where they settled till the time that Moses was called upon to lead them out of bondage? But this brings to the second objection, namely, As Moses found the people of Israel in Lower Egypt, where he continued only a few months after his return from Midian; how can it be supposed that they could have gone so far as Upper Egypt? To this it is answered, that these children of Israel, consistent with all the accounts we have of them, kept up a friendly intercourse with each other, and therefore it was no difficult matter to collect them together. Moses found them in such a situation, that notwithstanding all their afflictions, it was not difficult to communicate his intentions to them, and therefore they might have been brought together with the utmost facility; but of this we speak only by way of digression.

Among other ruins in this place, we observed four frizes of greyish coloured stone, and on them were the figures of Bacchus and Venus. As they were executed in the Roman taste, we concluded that they must have been made pretty near the time of Pompey. There was nothing like them here, all the rest being either Egyptian or Arabian. On the right hand of the portal are several buildings, and nothing can be more magnificent; but it was very difficult to get to them on account of the rubbish.

December 13, the calm continuing; we were obliged to be towed, and on our right hand to the west passed by several villages. Sailing along, we saw a vast number of Arabian Coptics, and some of our people put on shore in order to procure some corn for our poultry; but as the Arabians never do any work, but live by robbery, consequently, they have nothing to sell to strangers. Our people fired at some crocodiles, but did not kill any of them, for those animals are so wary, that they escape before any persons whatever can get within musquet shot of them, as they are very quick sighted.

December 14, the wind continuing calm; we were again obliged to be towed, and passed several villages, till we anchored at the antient City of Crocodiles, and some of our people who went on shore; killed several geese of the Nile. All the ground near this place seemed to have been much neglected, for it was quite parched up, and no corn growing on it. Some of the crevices in the ground, were so deep, that a rod six feet long did not penetrate to the bottom of them.

December 15, we had a fair wind all the night, but our barge-master was not in a sailing humour. At break of day, some of our people went on shore and staid till eight in the evening, so that it was that time before we could proceed on our voyage.

December 16, we sailed all night, for the wind was so favourable, that at five in the morning we had passed three villages on the east side of the Nile, together with several others on the west. A league farther on we came up with Afs Fuun, a genteel city, in which is a mosque, it being the capital of the province of Mettani, about two or three miles to the west of the Nile.

Six miles further, after passing a great number of villages, we came to Esnay, a large city on the western banks of the Nile, and here an Arabian prince resides. In this we saw a fine mosque, and one of the priests in our company, having a letter to the governor, went on shore to deliver it, but the governor had died some few weeks before, and his two sons were preparing to leave the place, having committed the administration of justice to a deputy. This deputy was then along with his women, so that the priest returned without seeing him.

In the middle of Esnay is an antient temple, closed on

on three sides, and its front is hemmed in by columns only, being four and twenty in number, and in fine preservation. A channelled border runs all round the upper part of the edifice; but in the middle, which is the front of the temple, is a sort of capital or ornament similar to those on all the grand portals in Egypt. One article is necessary to be observed here, and that is; that although all the columns are equal in proportion, yet they all differ in their ornaments, not one being similar to another.

The interior parts of the edifice are blackened by the smoak of the fires that were formerly used in the sacrifices; but most of the other parts are well preserved except the front gate, and the intervals between the columns. The havock made in this grand piece of antiquity is owing to the ignorance and barbarity of the Arabs, who spoil decorations from a principle in their religion, which forbids them to have any images, and they have even turned this place into a stable.

At six in the evening the deputy governor having taken leave of his women, set sail on board a large barge, accompanied by two others filled with soldiers, and his departure was proclaimed by the sound of trumpets and drums. In about two hours afterwards we sailed with a very favourable wind.

December 17, we had not proceeded much above half a mile, when the wind became so calm, that we were obliged to put on shore at a village called Sernig, on the east side of the Nile; but we had scarce fastened our boat, when one of those that set sail with the deputy governor, full of soldiers, came alongside of us. We were no ways pleased with our new neighbours; for they were so rude and insolent, that it was very difficult to have any thing to do with them, which to avoid we took all the care imaginable. Luckily for us, in about two hours a fresh breeze sprung up, and we pursued our course, sailing all the night, and passed three very populous villages. This day our barge struck against a sand bank, so that we were put to much trouble to get it off. Here the mountains are situated so close to the river, that there are only small spaces of ground left for the villages and the gardens.

Having this day passed by ten villages, we came to Edfu, a considerable city on the west side of the Nile, where the Turks have a garrison of soldiers. This port is not of Turkish architecture, but seems to have been originally the portal of a temple built by the Romans. It is in general well contrived, and its simplicity contributes to its elegance. On the front are three rows of figures, representing children in their faces, but in stature they are as high as men.

In the north side are several windows, by which light had been originally conveyed into the edifice, but most of them are now defaced. There is also another monument here, consisting chiefly of the ruins of a temple, that seems to have been dedicated to Apollo, the greatest part of which is now buried under ground.

This day brought us to Seraik, once famous for having in it many Christian churches; but it is now so much reduced, as to have only the appearance of a contemptible village.

Here we found the bed of the river extremely narrow, on account of the surrounding mountains, and in former times there was a chain across here, for the marks where it was fastened are still to be seen in the rocks.

The rock here is fifteen feet high, and on the top of it are the remains of several small chapels. In the neighbourhood of this place, are vast numbers of grottoes, and all of them have figures engraved upon them; but they have been so much injured by the ignorant barbarous Arabs, that we could not make any thing of them; and indeed this is in general the case with all the antiquities we met with in Upper Egypt.

From an attentive view of these grottoes, it appeared to us, that the unfortunate inhabitants of them had been buried in them. By the inscriptions upon them it is plain, that they were first cut out of the rocks by the antient heathens, who presided in this part of the country; but in the primitive times of Christianity they became the asylums of persecuted hermits.

On the west side of the Nile, is a village called Barnban; and opposite to it on the east, is Kornoruba, where there is a monument of antiquity situated behind a sandy mountain; but mostly concealed by a great number of wretched cottages. The building is supported by twenty-three columns well executed, covered with inscriptions; and the stones of which the roof is composed are of a prodigious size. The columns are twenty-four feet in circumference; but the whole is gradually falling to decay. There are several other monuments here, particularly the remains of antient temples and altars; but as the wind was favourable, we did not stay to make any observations on them, only it appeared to us, that in former times this part of Upper Egypt had been as well cultivated and inhabited as the neighbourhood of Cairo.

In the afternoon we arrived opposite a village called Ell-Kabonia, where a signal was made for our barge-master to go on shore, which he did not much relish; but finding the people were in arms, he was obliged to comply. One Ibrim, an Arabian, was governor; and when he had learned that we had come with letters of recommendation from Cairo, he ordered our barge-master to treat us with the utmost respect. In return for this civility, we sent him some bottles of liquor, with tobacco, which he received with ceremony and complaisance.

December 19, we came to an anchor before the city of Essuaen, situated on the east side of the Nile, but at present much changed from its antient grandeur. It has however a garrison of Turkish soldiers, and in it are four mosques. That which makes this place the more remarkable is, that it is near to the cat rafts of the Nile; and all travellers who visit those celebrated natural curiosities, stop here. Our barge-master being himself a janisary, went to the governor of the fort to give him our recommendatory letters; and soon after two janisaries came on board to invite us to come on shore, and spend some time in the citadel.

The governor treated us with the greatest civility; and he having told us that he would furnish us with asses and camels to carry our baggage to the first cataract, we begged that he would suffer one of his servants to accompany us as a guide, and we would pay him generously for his trouble. He immediately sent for his brother to be our guide, and we agreed on the price.

December 20, at eight o'clock in the morning, one of the priests who understood the Arabic language, came to us at the governor's house, in order to hasten our departure. The governor had agreed with a boatman to carry us from the first to the second cataract; but it took us up some time to lay in proper provisions. This employed us from Friday to Sunday; and during that interval, we went to visit a small island in the Nile, which seems to be the Elephantis of the antients. There are many ruins in this island, but most of them are totally defaced, so that little can be distinguished to point out what they originally were.

There is one ruin called the Temple of the Serpent, but it seems to have been no more than a sepulchral monument.

The inclosure round it seems something like a cloister, supported by columns, and in each of its four corners is a solid wall. This contains a large apartment, with two great doors, one to the south, and another to the north. It is filled with stones and earth, and there are many fine inscriptions on the walls, but they are so blackened by smoke, that few of them are legible.

In the middle of the apartment we observed a small square table, without any inscription upon it, which induced us to believe that there was an urn and a mummy underneath. We desired to have the table lifted up, but the superstition of the people was such, that it would have been dangerous to attempt it. These natives of Upper Egypt flocked round us in vast numbers; for they are easily persuaded that all the Europeans who are curious in searching into antiquities, are magicians, who practise the black art. Here and there

there, where the ground is fallen in, we discovered a vast number of ruins, on many of which were Greek inscriptions. Some of these were fine colonades; and the blocks employed in the building are of a whitish stone, not much unlike what is commonly used in Europe.

The course by water to the first cataract is full of little islands, and rocks of granite, with which each side of the Nile is here covered. We observed also a mosque half ruined; an old citadel, behind which is a little bay, defended by a natural dyke, consisting of large granite stones, whereon are many antient and curious inscriptions. Besides these, there are some remains of Turkish buildings; but as they are of no great antiquity, consequently they do not merit a particular description. But the most remarkable piece of antiquity here is a stone, on which are carved the signs of the zodiac; which may serve to confirm what has been often asserted by the antients, that the Egyptians were very early acquainted with astronomy.

December 21. The governor's son, who had the privilege of demanding the customs at the first cataract, came and paid us a visit; offering, at the same time, to honour us with his company, as well as with those of his servants. This was too generous an offer to be rejected, and therefore we treated him and his retinue with coffee, and likewise gave him such presents as we could afford; for nothing is to be done in any of the eastern countries without presents.

December 22. At ten o'clock in the morning the governor sent a guard of janisaries to our bark, to prevent any injury happening to us at the unloading our goods; and then he sent us thirteen camels, with three horses, and as many asses as were necessary for conducting us and our baggage. The concourse of people was so great, notwithstanding all the precautions that had been used by the governor to prevent them from assembling, that we were above two hours in packing up our goods. The governor's son ordered a trumpet to be sounded, to make the people disperse; but all was in vain, for they paid no regard to it.

Our road was on the east side of the Nile, and we came to a passage between rocks, so numerous, that no more than one camel could pass at a time. At the end of this place we came to a Turkish fort, built upon an eminence, but we did not stay at it. Having travelled about three hours, we came to the first cataract, which the natives call *Morradey*; and there we met the bark the governor had engaged for us. She was much smaller than the one we had hired at Cairo, but in all other respects we found it more convenient than we could have reasonably expected.

We paid the governor's son what were the common duties demanded; and likewise satisfied him and his attendants for their trouble in attending us. They seemed by their looks to desire more; for there is no such thing as satisfying the demands of the people in this part of Egypt; but we took no notice of their dissatisfaction.

December 23. Early in the morning, the governor's son came on board, in order to take leave of us; and we discharged a janisary, who had been of considerable service to us, not on account of bad behaviour, but merely because we had no farther occasion for him, and he was very well satisfied with what we gave him. Our barge-master, who had brought us from Cairo, came also to take his leave of us, and we presented him with a great-coat, and some things for his wife and children.

When we intended to land, we were told that the weather would not permit us till after the expiration of three or four days; and, to add to our misfortune, we found that it was now the Turkish *ramadan*, or *lent*; for by the law of the *alcoran* it is forbidden either to begin a journey, or conduct any servile work, at that solemn season; and that was the reason why our barge-master could not come on board.

According to our bargain with him, he was to carry our company and baggage for a stipulated sum; but here we found that all precautions were of no manner

of use. There was nothing but impositions to be met with; and when we complained of it to the pilot, his answer was, that he was obliged, for his own emolument; to take as many goods on board as he could possibly carry. We found that we were never to see an end of a vast number of inconveniences; but at the same time we made ourselves every way easy, because a continual repetition of impositions always habituates us to them.

December 24. Finding it in a manner impossible to procure carriages, we resolved to walk on foot; and for some hours we had a most agreeable journey, all the while contemplating the wonders of the cataract; and the rocks of granite that form it. After we had got on the sandy flat, we stopped to view the inscriptions, or rather hieroglyphics, engraved on the rocks; of which at present a great part remains. At the extremity of this sandy plain is a large burying-place, full of stones, with inscriptions on each of them. We took it at first for a Turkish burying-ground; but upon closer examination we found that we were mistaken. The tombs were almost alike, and had nothing in them similar to any we had hitherto seen; but not being able to form any judgment who were the persons that had been interred there, we spoke to a Jew that attended us, and who understood the Turkish language, desiring him to explain to us the inscriptions. His answer was, that there was not a Turkish or Arabic letter among them, so that he could make nothing of them. We desired him to enquire what was the tradition in the country concerning them; and he told us, that they were some monuments erected in memory of the first Mahometan caliphs who invaded Egypt.

A little further on, we saw an antient gate, part of which had been demolished, and the rest afterwards rebuilt. It seemed to have been executed in the Saracen taste, and consisted of bricks baked in the sun, mixed with large stones. This mixture seemed to point out that it had undergone a variety of revolutions. There were many other ruins in this place, but they are so much defaced, that it is difficult to say at what time they were first founded; nor is it easy to say for what purpose they were at first designed; all is conjecture and uncertainty.

December 25. Having first attended service for Christmas-day, we went to take a view of the cataract; and that we might not alarm the country too much, we stole out with one of our company, whom we imagined knew the Arabic language; but he knew no more of it than ourselves. We went to the place where we had been the day before, and where was the greatest fall of water. We continued making observations for above an hour, without seeing any thing worth notice, till at last we espied a man fishing, which afforded us no small share of pleasure, especially as the man invited us to take part with him in his pastime. We gave him a small trifle, which to him appeared as a present; for these poor creatures seldom know what it is to enjoy money. He did all he could to make us acquainted with every thing in the place, and we obtained all possible information from him; but indeed there were but few things that merited our observation. Indeed, the antiquities are so numerous, that we were in a manner unable to form any proper notions concerning them.

During this expedition, the weather being extremely hot, we had almost expired with thirst; nor could we catch a drop of water to quench it, although in the middle of the Nile. The rapid course of the water rendered the granite rocks so slippery, that although we made several attempts, yet we could not hold any water in our hands. Almost exhausted, we went on shore; and our guide, who was a native of the country, conducted us to his hut, where we were regaled with dates and milk. He shewed us his furniture, which was not of the most sumptuous nature, but such as an auctioneer could soon take an inventory of. Indeed, the principal part of his furniture consisted in poor naked children, who ran about seemingly insen-

sible of their afflictions, and we could not refrain from giving them a few trifles.

As a proof of his gratitude, he opened one of his large jars, to shew us in what manner corn is preserved in that country. At the same time, he carried to our barge a large quantity of fresh provisions; and although he refused to take any thing for them, yet we paid him in the most generous manner, being determined to encourage benevolence wherever we found it.

Here we found several curious plants, which seem to be wholly unknown in Europe, particularly one called in Arabic *Oschar*, which is at least three feet in height. The colour of the leaves is green, and the flowers have some resemblance to those of a cherry-tree. The outside of the flower is white, and the inside partly white and partly violet. Its fruit is as large as a goose's egg, and the figure not unlike that of a peacock, with veins and ribs like those on leaves.

December 26. At *Morrada*, where the first cataract of the Nile is now observed, no less than three courses were formed by several small islands, which is of great service to the navigation, not only here, but in other parts of the Nile. On the south-side appeared the island of *Ell-Heirt*, remarkable for containing a vast number of antiquities. There is also here an anchoring place for the barks that go to and come from the second cataract; and they are of a smaller size than such as usually sail up the river from Cairo. In general they have but one mast, and seldom draw more than three feet of water. At this place, our barge-master was rather sulky, but by good words and a small present we prevailed upon him to stop till we had taken some fresh provisions on board, for at that time we were in great want of these articles.

December 27. At eight o'clock in the morning, we sailed with a strong northerly wind, and cleared the harbour of the first cataract; we then arrived at the island *Ell-Heirt* already mentioned, which is the *Philo* of the antients, and situated near the eastern banks of the Nile. At a little distance from it is another island, much larger, but not inhabited, and its banks are shaped like a wall cut in a rock. There are several remains of antiquity on this island; but the wind was so brisk, that we had not an opportunity of making proper observations on them. We observed, however, a kind of citadel, on which were several inscriptions in the Egyptian language. Around the citadel are several bulwarks and bastions, which shews that it was, in former times, a place of some repute, although it has now fallen to decay.

There are also the remains of a fine temple, erected in the most masterly manner, and there is no doubt but it has stood upwards of two thousand years. Our barge-master hurried us in such a manner, that we had no time to make proper enquiries as we proceeded up the river; but we were more fortunate in returning back, for we put all his objections to silence by a bribe, which we might have done sooner, had we known the mercenary temper of the people.

The governor's brother, who was our conductor, landed along with us; but it being late, we were obliged to defer gratifying our curiosity till next morning. We asked if the island was inhabited; and being answered in the negative, we took a lantern, and went on shore. Our first care was, to make the tour of the island, in order to form a general idea of the edifices; but we had not gone far, when we perceived a vast number of cottages. We began to suspect that our barge-master had imposed on us, and therefore we advanced with the utmost caution; but on proceeding further, we found these cottages were not inhabited.

The first thing worthy of notice was the great temple of *Isis*, which is one of the finest ruins in the world. Near it is another temple, not so large, but in the architecture much more beautiful. Having seen every thing in this island worth notice, we continued sailing up the river, and passed by a great number of villages, in most of which were many antiquities, but the wind would not permit us to take any notice of them. Some of them seemed to be the ruins of antient

temples, and others the walls of forts, that had been built by the Arabians when they first established their religion in Egypt, under the domineering power of their caliphs.

December 28. In the morning about eight o'clock, we were so much becalmed for want of wind, that we were obliged to come to an anchor towards the east side of the Nile, where we saw several vallies agreeably situated, but none of them contained any thing that deserved the notice of a traveller. Our barge-master was a native of the place, and he assured us, that we might go on shore with safety; and we found what he asserted to be true. As we were some time becalmed, we went in search of antiquities; and discovered the remains of an antient harbour so curiously constructed, that we concluded it had been the work of a most ingenious artist.

At some small distance from thence we saw several cottages built of stone, and all of them covered with inscriptions. We naturally imagined that we should have found some magnificent remains of antiquity in this place; but we were disappointed, for we saw nothing but a heap of stones, on many of which were inscriptions, and the workmanship was curious. The breadth of the land from the mountains to the Nile, at this place, does not exceed one hundred paces, so that the appearance is romantic.

December 29. All this day we were so much becalmed, that we could not proceed, so that we sent some of our people on shore in order to purchase a heifer, which they did for a trifle: but when we came to eat it, we found the flesh very disagreeable; indeed it was so lean, that nothing but necessity could have induced us to eat of it.

December 30. We sailed at eight in the morning, and in a few hours passed several villages situated on the banks of the Nile; some on the east and some on the west. About two leagues further we came to a large village where there is the tomb of a Mahometan saint, and this place is reckoned to be the midway between the first cataract and *Derri*. On the left or east side we observed some ruins in the form of an amphitheatre, but upon closer inspection they appeared to us Turkish buildings. On the mountains adjoining to this part of the river are the ruins of many houses, built, perhaps, for places of retreat; but although they are undoubtedly of great antiquity, yet it is in a manner impossible to discover in what age they were built: perhaps by the heathens of old, and made use of by the Christians in latter times, or even by the Mahometans.

At this place the bed of the river abounds so much with rocks, that it is extremely dangerous to sail along; and in the intervening spaces are many whirling gulphs. We used every precaution we could think of in order to steer through them all; but notwithstanding, we struck upon a rock, and were in the most imminent danger. There was too great a depth of water for our sailors to go into it, nor could we reach the bottom even with long poles. Our barge-master attempted to persuade us to strip, but we remonstrated that it would be impossible to do so on account of the whirlpools: But while we were disputing in this manner, the wind changed, and a brisk current blew up, which brought us safe off, and in a few hours afterwards we passed by several agreeable villages.

December 31. Having spent the night very agreeably, we set sail about seven in the morning, and past by seven villages without meeting with any thing remarkable, except that we were soon stopt by a calm, which obliged us to come to an anchor near *Subua*, a village on the eastern branches of the Nile. In the neighbourhood of this village are several antiquities, but they are not so magnificent as many of those which we had formerly seen in our voyage up the Nile. The most conspicuous of these is a temple, the stones of which are well joined together, but the rest of the architecture is far from being elegant. It is built in the antient taste of the Egyptians, as far as we are able to form any notions of their architecture from the accounts

counts that have been transmitted to us. The greatest part of the portal has been thrown down by the violence of time, but there is still so much remaining as to point out part of its antient grandeur.

Her setting sun still shoots a glimm'ring ray,
Like antient Rome, majestic in decay.

Most of the ruins in this place are covered with sand, so that it is not easy to form a proper notion of them. Indeed the mind of a traveller is so much taken up with the appearance of rocks and mountains near the brink of the river, that few observations can be made. These beauties of the creation sink deep into the human mind, and in general they make such an impression as can never be effaced but by the baleful influence of ingratitude.

January 1, 1738. We lay at anchor all night, and about seven in the morning the wind being favourable, we continued our voyage up the Nile; and passed several more as agreeable villages as any we had seen. In the afternoon we came to a village called Koroskof, where we were obliged to stop in consequence of an order from an Arabian prince, who resided in the neighbourhood, or who rather came once in the year there to plunder.

Sailing along, our barge-master declared, that he would not carry us up the several cataracts of the Nile unless we would give him some additional wages. We paid little regard at first to what he said, which induced him to laugh at us, and he had even the assurance to tell us, that we would be obliged in a little time to alter our tone; we had some suspicions that he intended to do us an injury, and therefore as we had letters of protection from the basha of Egypt, we told him, that if any one attempted to hurt us we would defend ourselves to the last extremity; and that if he should act with duplicity, he should be the first victim of our resentment. This made him change his tone a little, and he swore by his beard, that he would have no hand in, nor any connections with, any disaster that should befall us. He added, that he would go with us as far as we pleased, but begged us to be upon our guard, because he could not answer for the conduct of the Arabian prince, who was in a manner the sovereign of the country, and therefore he advised us to be upon our guard. Soon after this we were becalmed, and the wind being rather against us than for us, we were obliged to come to an anchor near Amada, a village on the west side of the river. There we landed, in order to view an antient Egyptian temple, which has been since made a Christian church. Of this there cannot remain the least doubt, because of the figures and inscriptions upon it, all of which relate to our Saviour and his apostles. Near it formerly stood a monastery, but no remains of that are now left. The bed of the river is very shallow at this place, and here we saw a crocodile above thirty feet in length. It was lying on the banks of the river; but no sooner did we arrive, than it plunged into the water.

January 2. At eight in the morning the wind being northerly, we attempted to proceed up the river; but here we found so many intricate windings, that it was in a manner impossible, so that we were obliged to lay to several hours.

The banks of the Nile, in this part of Upper Egypt, are all covered with a variety of herbs and plants, so that the whole has a chearful and beautiful appearance. That day we viewed a very strange practice observed, by the people in crossing the Nile, and such as we had not seen before. Two men sat on a stack of straw, preceded by a cow that swam before them, and one of them held the tail of the cow with one hand, and with the other he managed a rope fastened to her horns. The man behind steered with a little oar, and in this manner they crossed the river in safety.

The same day, we saw some camels loaded with goods cross the river in the following manner: a man swam before, having the bridle of the first camel in his mouth, to whose tail the second was tied, and the third to his. Behind, there was a man seated on a

stack of straw, whose business it was to see that the camel went on in a direct line.

January 3. Early in the morning we sailed, and although the wind was northerly, yet there was so little, that we did not proceed above three leagues during the whole of the day.

On each side of the river we saw several beautiful villages, which appear the more delightful in consequence of their being built upon eminences near the water, and in each of them is a mosque.

January 4. Before we set sail in the morning, we had a serious piece of conversation with the pilot, who came to us, and demanded a coat. No person on board had promised him one, so that at first we paid no regard to what he said. The fellow, however, was so impudent, that he took his things out of the boat, and swore a solemn oath, that he would not depart from that place for fifteen days. He laughed at us, when we told him that he should not return to the bark without first asking pardon of us; for those fellows are so insolent, that there is scarce any such thing as bearing with them. However, when he found that no person went after him to intreat him to return, he came back of his own accord, and asked leave to come on board; we told him, he might come on board for that time, but we intended, that if ever he should be equally saucy for the future, he should be totally discarded.

Having thus settled matters, we set sail again up the river, and passed by several villages till we came to Derri, where the Nile shapes its course westward, and here our bark was made fast. Some of the peasants in the adjoining villages having given notice of our arrival, there was a vast concourse of people assembled to see us. Hence we inferred, that we could not with safety go up to the second cataract, on account of the tyranny of the Arabian chief, who would have first stripped us of our property, and then murdered us.

January 6. Great part of this day we spent in trifling altercations with our barge-master, about our expence in returning to the first cataract. We had great reason to fear that our barge-master was a designing villain, who intended not only to impose upon us, but even had a design on our lives; for he put us off with so many false pretences, that we were convinced that no honest man could have acted such a part. We were fully convinced that he was a most abandoned villain, and therefore, that we might be no longer subject to him, we insisted on his returning with us down the river, which we did with the help of oars.

January 7. We had rowed all the preceding, and continued to do so all this day. About eight in the morning, we passed by Guita, where we had another squabble with our barge-master, who declared, that if we would not give him more money, he would turn his boat, and carry us back to Derri. In answer, we told him, that we would throw him into the Nile, and take the conducting of the bark upon ourselves, which curbed his insolence so much, that he left the whole to our own generosity.

January 8. During great part of the night the current had been extremely favourable, but about noon there was such a strong northerly wind, that we were obliged to come to an anchor near the east-side of the Nile, and just adjoining to a village called Derdour. Here we found it extremely difficult to procure provisions; for although there were enough in the place, yet the people were so knavish, that there was no such thing as treating with them.

January 9. Although the northerly wind was still strong, yet by the assistance of oars, we pushed on as well as we could all the day, and in the evening we arrived at Abohuer, where we were pestered with a number of impertinent questions concerning the manner in which we had left Derri. All who visited us here seemed to be thieves, and their intention undoubtedly was to rob us, for some of them swam on shore from the opposite side of the stream of the river; and, upon the whole, they seemed to be the greatest villains we had ever seen. They seemed to be strangers

to moral honesty; and as for plunder or rapine, they consider it as a virtue, rather than a crime.

In returning, we observed another invention of the natives to cross the Nile, which we had not hitherto taken notice of. They get astride on a large piece of timber, and they use their arms as oars. In this manner they cross the rivers with ease; and what is very remarkable, there is seldom any accident happens to them from the crocodiles; for although these are most dreadful creatures, yet they hardly ever injure any person, unless they give them disturbance.

January 10. Early in the morning, we began to row; which was attended with much difficulty, as the wind still continued to blow fresh from the north. In the afternoon our barge-master wanted to come to an anchor; but in consequence of a small present, we prevailed on him to continue his voyage. The weather, during the whole of the night, was extremely agreeable; and we spent the time in making remarks on several passages in antient history, in which we were considerably assisted by the two Romish priests who were in our company, both of them being men of real learning, and well acquainted with the classic authors.

January 11. About nine in the morning, we arrived at Morrada; and the son of the governor, who had hitherto attended us, began to assume the most domineering airs, insisting, that we should pay him an additional sum of money, in order to conduct us to Essuaen. This, however, we did not immediately comply with, but told him, that when we saw his father, all things should be settled on the most amicable terms.

January 12. About noon the governor's son brought us several sorts of provisions, and provided us with such conveniences as we wanted. We immediately changed our baggage, and set out for Essuaen, and were conducted to the governor's house. The commandant of the fort at the cataract was there when we arrived, and he ordered that all our baggage should be brought into the house, and the doors shut.

This mysterious proceeding did not very much alarm us, because we were sufficiently armed to oppose any hostile attacks that he might attempt against us. When he had paid the camel-drivers, he saluted us, declaring at the same time, that his reason for acting in this manner was, that having heard of the bad treatment we met with at Derri, and finding many people assembled to look at us, he thought it his duty to provide for our safety.

From the plausibility of his reasons, we began to form a very good opinion of him; and, except his teasing us for a few presents, he did us all the service in his power. Our lodgings were indeed very contemptible; but hardships are little considered by travellers, when curiosity prompts them to undertake and sustain any thing.

A slave, appointed to attend us and do what we wanted, delivered up the key to us at night. We had plenty of mutton and poultry, but we were obliged to pay dearer for them than in the public market.

January 13. In the morning, we were told that a small bark was to sail for Cairo, upon which we went to view it, but found it was too small, and the master asked too much for our passage. We did not make a bargain, for the governor's son told us that the journey was fatiguing enough without being cooped up, and that there would soon be a larger bark at the place to carry us. We bargained however with the master of the small one, to ferry us over the next day to the other side of the Nile, the governor's son having promised us two janisaries and a valet to direct us to the antiquities.

January 14. We crossed the Nile early in the morning, accompanied by the priests, valet, and janisaries; but we were obliged to fall down the Nile above two miles, there not being water sufficient to admit our coming to land. And thus, when we landed, we had as far to walk as we had fallen down the river. Our guide led us over mountains of sand, which here skirt

the river; and, besides the fatigue of crossing over the sand, we had our legs torn with briars and thorns, which abound in this part of the country. The heat was excessive, and after three hours labour we came to the place we were in quest of, quite tired. But, to our great mortification, we saw nothing worthy of the toil it had cost us, and which we were obliged to undergo a second time in returning back.

January 15. The governor's son brought a barge-master to us, whose vessel then lay at the port of the cataract, and was to be at Essuaen in three days. He engaged to carry us either to Cairo or any where else we pleased, and we gave him earnest. The governor's brother, who had accompanied us to Derri, paid us a visit, and related to us all the particulars of the horrid plot that had been laid by the Arabian prince to destroy us. He added, that he had saved us, by his advising us to return; which circumstance we believing to be true, induced us to bestow upon him some presents, which he received with thankfulness.

January 16. About noon Ibrahim Aga, the governor, expired, upon which his son sent to inform us of it, and that he was to succeed him. We returned our compliments of condolence to him, accompanied with some little presents he seemed to desire.

In acknowledgment for this favour, he sent us, in the evening, a guard of three janisaries, which was the more necessary, as nothing is more common than for tumults and insurrections to happen when a governor dies. As we could not, however, trust altogether to these janisaries, two of our people watched every night; but no disaster happened. Nothing of any importance occurred to us during four days longer that we were there; but we took care to obey the new governor's advice, by keeping within doors as much as possible.

January 20. The barge-master came to inform us, that his vessel was arrived, and moored under the citadel. He told us to get our things in readiness, as he would be ready to sail in a day or two.

January 22. This day being a grand festival among the Turks, the governor sent us a sheep. This present was indeed in the name of his sultaness, which intimated, that we had not hitherto sent her any thing; which undoubtedly was a great oversight in us, for the young governor had used us very well, and we were no strangers to the Turkish practice, that no business can be transacted, no information received, no curiosity gratified, nor any reparation obtained, where presents are wanting; which custom is of very great antiquity.

January 23. At length the barge was brought to the place: we went to take a view of her, and found her both roomy and empty. She drew but a foot and three inches water, and was flat bottomed. All these vessels on the Nile are made of sycamore wood, of which also the mummy-cases are made, being very hard and durable. The barges are very strong, and yet many of them perish, on account of their being badly put together, or through the ignorance of the pilots who conduct them.

Having settled every thing concerning the disposal of our baggage, we sent some presents in the afternoon to the sultaness, who ordered her slave to tell us, that she was well pleased with them. But her unsatisfied husband complained that we had not sent him any, although he had already almost drained us of all we had. He sent us word at the same time, that next day all sorts of provisions should be sent us. Our interpreter was a Jew, and being ignorant of the nature of trade on the Nile, suffered him to take some dates on board to dispose of at Cairo.

January 24. The camels and asses that were to carry our baggage came to us in the morning, and in the afternoon we went on board. A scuffle arose among the fellows that drove the camels and asses; and one boy being hurt by a knife, his master and a croud of women increased the tumult, which after some time was suppressed by the janisaries sent at our request by the governor; and one of those was ordered to remain with us as a guard.

Since the death of the old governor we had not seen the new one; for by the law of Mahomet he was obliged to remain at home a certain time. But notwithstanding the severity of this law, he, either for his own interest, or to oblige us, broke through it, and came to us at midnight, accompanied by a servant carrying a long pike, the mark of his master's dignity. We received him with politeness, and invited him to come on board, which he complied with, and drank coffee. He then gave us some hints of his wanting more presents; but we having assured him that we previously resolved to give him some more, he was all good nature, and desired we would deliver some letters from him to the governor of Cairo. After some hours conversation he took leave, wishing us a good journey, begging, that when we delivered the letters, we would solicit for his being continued in the place his father had so long enjoyed, and promised that on the Sunday following all things should be ready for our departure.

January 25. Our barge being about a mile from the citadel, our poor barge-master was obliged to give the rapacious governor one-fourth of the money we had agreed to give him for our passage. On telling us that he wanted money to buy necessaries, we cheerfully advanced it; but we found at last that it was to lend to our Jew interpreter to buy dates for the market at Cairo, which proved of great disservice to us in the end.

In the evening the barge-master who had brought us from Cairo came on board our vessel, and made us a present of a sheep in fine order, with a hamper of bread, for which we bestowed on him such things as we thought would be agreeable. He was a janisary, and lived at his ease; for these janisaries, who are the militia of the country, enjoy a great number of valuable privileges.

January 26. The barge-master who had carried us to, and brought us from Derri, came on board, with a pretended demand of his being entitled to a coat, besides some money. We referred him to the *cadi*, or civil magistrate, who decided, that he was not entitled to any thing from us, besides what we had already paid. In the evening we sent some presents to the governor, with a small sum of money for the use of his house, all which he received with great politeness. Every thing being now ready for our departure, we resolved to leave Upper Egypt, and proceed on our passage to Cairo.

January 27. About one in the morning our men began to ply their oars; but a strong north wind impeded us, till about noon, when it died away, and then we ventured on our course till seven in the evening, when we arrived at a small village, where we found the commandant of Esney encamped. He ordered us on shore, and we waited on him with several presents, but found him a most insatiable wretch, like most of the Turkish governors.

January 28. Early in the morning he sent us two fat sheep, merely that we should send him more than they were worth, which we were obliged to comply with. Just as we were going to sheer off, he sent to us, desiring we would send something that would make him vigorous in his seraglio, at which we laughed heartily; but to part with him on good terms, we sent him two bottles of Hungary-water, desiring him to take a good dose of it in the morning, with another in the evening.

We set off, and in about an hour arrived opposite the antient temple of Ronomba, and we went on shore to view it; but few remains of it are left. A little farther we went again on shore, in order to take some drawings of antiquities; but we had not been long there, when our Jew came to inform us, that there was a band of wild Arabs in the neighbourhood. I did not believe him, but continued taking my drawings till the barge had sailed; so that it was late before I overtook it.

January 29. The calm lasted all night, and greatest part of the next day, which contributed much towards

our getting forwards. From time to time we saw several crocodiles, and fired at them, but none of them were killed. About the middle of the night we came to Tunaeg; a large village, where we met several barges put to shore, and the passengers conversing with each other in a friendly manner. Here our baggage was examined, and the letters we had brought from the new governor of Essauen had a mark put upon them, and were re-delivered to us.

January 30. During the forenoon of this day we proceeded a considerable way, in consequence of the north wind having ceased; but it sprung up with such violence about noon, that our rudder was broken. We were stopped in the middle of the Nile by the conflict of the wind and the current, which caused such a rolling, that many on board fell sick; but our men plied their oars with so much dexterity, that in a short time we got to the village of Duneg, where a bark passed us, having on board several Europeans. Our first care was to get the rudder mended; and the wind continuing more strong from the north, we were obliged to stop there the whole night.

January 31. We went on shore to view some antient ruins, where a temple had formerly stood; but although we soon afterwards set sail, yet even at eight o'clock at night we had not got above three miles, so strong was the north wind. Our barge-men being much fatigued, we would not for that night desire them to proceed any farther; so that to give the poor fellows a little rest, we anchored in the middle of the river; where, during the whole of the night, nothing of any importance happened to us, any farther than our being frequently disturbed by the cries of the wild Arabs.

February 1. At sun-rising we set sail again; but the north wind was so strong, that we were again forced to come to an anchor at Ell-Ardie, situated on the western banks of the Nile. Here we remained all day, and some of our people went on shore, and killed a dozen of geese. In the evening we made new efforts to advance, but the wind being still against us, we were obliged to come to an anchor near a little island formed by the fall of the waters of the Nile.

February 2. The north wind still continued, and was very strong, so that all our attempts to row were defeated. All the poor barge-men could do was to row us to the opposite side of the Nile, where we came to an anchor on the borders of an uninhabited plain, and here we saw several mountains at a distance. Towards evening there was a calm, and having unmoored our barge, we pursued our journey as far as Schagab, and might have continued all night, but we stopped there in order to take in wood, of which we were in great want. This village is a little distant from the west side of the river, and near it are many plantations of date trees, and the country has a cheerful appearance, being full of people, and well cultivated.

February 3. We had not sailed long when we saw several crocodiles; but although we fired, we did not kill any of them; and indeed we may here observe, that it requires much art for any person to dispatch them. In the afternoon we passed by the antiquities of Arment, and pursued our course without interruption till we came to a small village, where the passage is extremely difficult, because the Nile at that place has no current. At last we got as far as Luxxor, where the water was so shallow, that we were obliged to land a mile below the village, and near a place where there are several remains of antiquity. At midnight we went to see these remains of antiquity; for although there were several swarms of Arabians in the neighbourhood, yet our barge-master told us we need not be afraid of them.

February 4. These ruins consist of the remains of antient temples; and after we had taken drawings of them, we attempted to go into the village, where we were told there were several more to be seen; but the dogs barked so loud, that prudence induced us to retreat to our barge. In the mean time the Arabs came up to us; but we amused them with a few trifling presents, and about eleven in the forenoon we got safely

on board. The Nile being very shallow on that side, we were obliged to land two leagues lower, in order to take a view of other antiquities. Our barge-master knowing (says Mr. Norden) how much I had been fatigued, promised me a horse; but the beast was so unruly, that I lost some of my papers, which were found by one of the wretched Arabs, who gave it to his captain, from whom I procured it for the consideration of a small present. This affair being settled, we went again on board, but were soon after obliged to come to an anchor, the wind blowing fresh from the north.

February 5. All this day the wind varied so much, that we went frequently on shore, and walked along the banks of the river, being always ready to go on board whenever we found there was a necessity for it. In the afternoon, the wind from the north was a little more calm, so that we thought to have proceeded on our voyage, but our barge-master quarrelled with his pilot, and asked our consent to have him dismissed. To this we made no objection, for the fellow was, in all respects, very contemptible. In order to settle their disputes, they were obliged to go before a *cadi* or civil magistrate, and the pilot lost his cause, besides being deprived of one half of his wages, so that he was obliged to sit down contented with his loss.

February 7. The wind was still against us, and, to add to our misfortune, our barge began to take in water, which were motives sufficient for us to stop. The barge-master sent for a carpenter, who, before night, repaired all the defects, and the wind abating, we continued sailing till about nine o'clock in the forenoon. Near a village called Dandara, we put on shore, and although there were several antiquities in the neighbourhood, yet we could not prevail upon our company to visit them.

February 8. The whole of this day was spent in sailing in a manner against the wind, for it blew strong from the north, so that we were obliged again to put to an anchor. Here we had an opportunity of viewing some parts of the country, which brought to our remembrance many of those beautiful passages we had read in antient history. That Egypt was what it has been represented to us in the history of the Old Testament, cannot be denied; for, taking all the circumstances together, it must have abounded with many celebrated cities and magnificent temples. If it was once the seat of idolatry; it was also the source from which all the polite arts and sciences flowed. From that fertile soil they were brought into Greece; and the Romans having availed themselves of them, diffused those invaluable benefits over their conquered provinces.

February 9. As soon as day began to appear, we set off, and although the wind blew strong from the north, we did not stop till noon, when we came to Hau, once a very considerable city. Near this city is a heap of stones, which seem to have been the ruins of an antient temple, but we could not find any inscriptions upon them. In viewing this city, we found that many of the houses had been built with the fragments of antient columns, and the remains of most magnificent structures. The evening being calm, our oars began to ply but about midnight; we struck on a sand bank, which employed us till morning to get off from it. This, however, with much difficulty, we effected; but we were so much fatigued, that we longed for rest, although we knew it was not prudent for us to take any.

February 10. Our poor barge men were so much fatigued, that we considered it proper to give them a few hours rest, which they accepted with great cheerfulness. Here the mountains rose to a prodigious height on each side of the river, and in those mountains are vast numbers of grottoes cut out by the antient Egyptians, but since that time, used as cells for persecuted Christian hermits.

We steered along the eastern course of the river, but with great difficulty could make any way, for the bed of the Nile having changed that year, there were a great number of sand banks which obstructed the navigation. By dint of labour we got over three, but met

with many more, and our barge-master was obliged to land, from time to time, in order to sound the depth of the river. Being informed, that if he landed a little farther, he would have more depth of water, his men were so much animated, that in a few hours they brought us to Sambuud, where we put to anchor in the middle of the Nile, intending to wait there till morning.

February 11. At six o'clock the bark was rowed off, and went with great speed, there being scarce any wind to impede her; for so early as nine o'clock, we were at Belliene, where we were obliged to put in, and steer by the eastern shore of the Nile, because of the shallows on the opposite side; when we had got a little farther, a strong north wind obliged us to put on shore. Here we saw a barge obliged to unload, because she could not get over the sand banks that reached from one side of the river to the other. In the afternoon, we pursued our course, and got beyond Bardis, where we found ourselves so embarrassed by surrounding sand banks, that we did not know in what manner to get from among them; believing that we should be obliged to unload like the others.

We promised a man sailing in a little canoe a handsome reward, if he would enable us to extricate ourselves out of our difficulties; and he effected it, so that we continued sailing till ten in the evening, when we came to an anchor.

February 12. In the morning we went on shore to take in provisions, and we met with a Romish priest, who requested that we would take him on board to Cairo, which we readily granted. Having refreshed ourselves, we were ready to depart, not thinking of any obstacles that would happen, when, to our great surprise, through the knavery of our barge-master and our Jew interpreter, an embargo was laid on all the goods on board our vessel. For these two *worthy* gentlemen, companions in wickedness, had attempted to cheat the custom-house, so that we were obliged to pay the duty for all the goods taken on board. Our barge-master had played these tricks so often, that he was glad to abscond lest he should have been hanged, so that he went down the river before us, but had the grace in him to leave behind a pilot to conduct our vessel. All this was owing to the mischief occasioned by taking the dates with us, for the master of the custom-house came on board, and told us, that he had an order to search all our coffers, which we were obliged to comply with. We desired him to open such as he thought proper, and he made choice of two, but did not find any thing in them liable to duty; he therefore took leave of us in a very polite manner, and we sheered off, but had not made much way when we found ourselves again on a sand bank. With great difficulty we got the barge off, and then we went on to the eastern shore of the Nile, where we anchored, near the feet of some high mountains.

February 13. As soon as the moon made her appearance, we set sail, and by seven in the morning found ourselves opposite to Meschie, where a Greek merchant came to us, and desired to be admitted on board our barge; but as we had little room to spare, and as we did not chuse to make ourselves too cheap, we refused him admittance; but we might have saved ourselves this ceremony, for our barge-master, in opposition to all our remonstrances, put his goods on board. This roguish manner of acting aggravated us so much, that we ordered the Greek's baggage to be thrown on shore. The Greek merchant threatened us, but we only laughed at him; and, to complete his mortification, set him at defiance. This was, in a manner, absolutely necessary, for there is such a connection between these Greek merchants and the barge-masters, that one never knows when he is in a state of safety.

At eight o'clock in the evening, the prince of Achmin arrived in a bark, attended by six more. He did not stay long, but took leave of us with great affability, attended by his retinue, who had colours flying, and trumpets blowing. We followed him as close as we could, and before midnight arrived at Achmin, where

where our bark was made fast; in order to take on board our Romish priest, who had gone over land: The prince of Achmin had taken possession of the whole of this territory, although he had no right to it, but we took no notice of his conduct, as we had no connection with it:

February 14. The priests came to us early in the morning, attended by one of the prince's officers, and several Christians, who made us several small presents of dates and other sorts of fruits; we in return gave them a few trifling images, which we looked upon as mere baubles, so that we did not pay any regard to them, but they seemed highly pleased with them. We took leave of them, and set off with a fair wind, which lasted till five in the evening, when a violent storm arose, which obliged us to put on shore at a village called Moraga.

Half of this village had, at some former period, been overflowed by the Nile, so that we could not discover much of its ruins. Here our barge struck upon a sand bank, and it was with difficulty we could get it off. Near this village are a vast number of mountains, in which are several curious grottoes, but we had no time to make any remarks concerning them.

February 15: In the morning, some of our people went on shore, but although they went on shore to get fowls and provisions, yet they soon afterwards returned on board. All the way along the banks of the Nile, we saw a great number of villages, pleasantly situated on the bank of the Nile; but many of these having been already described, we shall not take any notice of them. We intended to have continued our course during the whole of the day, but were retarded in our progress, in consequence of striking in a manner continually on sand banks. Indeed, this disaster was so great, that we were obliged to come to an anchor till next day, submitting in the mean time to many difficulties.

February 16. At day break we weighed anchor, and passed by Catea, once a large village, but above one half of it has been washed away by the Nile. We observed, in some places, the tops of palm-trees, and the roofs of houses peeping above the water. By this and many other inconveniences, it appears that the Arabians are not much concerned about their houses; although they have such regard for their lands, that when disputes arise concerning the settlement of bounds, where the river has overflowed, the petty princes often go to war. We continued sailing all this day, and about sun-setting got between two islands, where the passage was very dangerous, on account of the current being strong, and there being a vast number of sand banks. About ten in the evening, as soon as the customhouse officers perceived our barge, they fired a musket to make us come to. If we had had no merchandize on board, we should have been dispatched immediately, but the unlucky dates occasioned our being detained till the next day.

February 17. Having paid the custom-house duties, we put off in the morning, and passed several villages; and at eleven at night we passed to the western banks of the Nile, and saw thirty barges, all collected in order to assist each other against pirates, the inhabitants here being the most arrant thieves in the world.

February 18. We put off at day-break, and continued our course till ten o'clock, where we passed Scheih Abade, where formerly stood the famous city of Antinopolis, of which some remains are still to be seen. We only saw them from the barge, for there was no possibility of getting on shore. Near this place we saw a fine wood, but vast numbers of the trees had been this year washed up by the roots, in consequence of the overflowing of the river. We saw several grottoes that had been cut in the rocks, and there were several gates fixed to some of them. At eight in the evening, we stopped near a village, situated on the east side of the river, and near it we saw a sugar mill.

February 19. As soon as day-light appeared, we crossed the river, in order to go to Menie, and there, for the first time our rapacious barge-master paid the

duty for his dates. The duties here are appropriated for the support of an officer, whose business it is to send corn for the support of the soldiers at Cairo. He is also obliged to send an annual tribute to the Grand Seignior at Constantinople. When we arrived at Menie, the fog was so thick that we could not see thirty paces before us. We went on shore to view the dyke which surrounds the city, in order to protect it from the inundations of the Nile. It has not been finished long, but is a place of great strength, and well executed. Continuing our course down the Nile, we passed the convent of St. Martha, situated on a mountain, where we saw two or three hundred cormorants, with a variety of other fowls. Near the convent appeared something like the ruins of an antient city, but upon enquiry we found it was the remains of some grottoes cut out of the rock.

February 20. We left this place in the morning, and made a great way, the wind being favourable and calm. About nine we stopped at Benemhamed, to take in provisions, and were so lucky as to get every thing we wanted. We continued sailing till the evening, when we came to an anchor before Scherona; where we refreshed ourselves till the morning.

February 21. We put off early in the morning, and went briskly on till we came near Benesoef, where we got entangled among a fleet of barks, laden with corn for Cairo. Some of them were aground, and we should have been in the same disagreeable situation, but that we had got into the stream, which in a short time carried us down to Benesoef. There we were obliged to go on shore, and pay a duty demanded for every barge that passes this way. We stopped about an hour, and then put off, and soon after saw another barge aground. She had been attacked the preceding night by robbers, and not being in a condition to defend themselves, her crew cut the ropes she was fastened by, and let her run adrift down the current, which drove her on a sand bank. This evening we cast anchor before an Arabian village, on the east-side of the river, and passed the night there.

February 22. In the morning we put off, and at twelve o'clock reached a small town, where we had some acquaintance with the chief magistrate, but upon enquiry, we found he was gone to Cairo, to assist the bey in conducting the caravan to Mecca. Having received this information, we sailed without loss of time, and soon after passed the Seven Islands. We went to land at a place where we had a view of the pyramids of Sakarra. We continued sailing till nine at night, when our vessel struck among some stones, and all our efforts to bring her off were ineffectual till midnight, when she worked herself off. We anchored near where this accident happened, but next morning a strong wind blew from the north.

February 24. This day we got to Cairo, and anchored at the same place from whence we had set sail on the 18th of November the preceding year. We sent immediate notice of our arrival into the city, and a sufficient number of camels were sent to carry our baggage; and thus ends our journey up and down the Nile.

This accurate traveller, who has given us the most perfect description of this celebrated river, concludes his account of Egypt with the following curious particulars:

The conquest of Egypt was completed by Selim, the first emperor of the Turks, and one campaign made him master of that kingdom; but this was only the Lower Egypt; for the Arabians, who inhabited Upper Egypt, and still infest that part of the country, paid little regard to his power; this Selim knew, and therefore established such a form of government in Lower Egypt, as he thought would be sufficient to keep those worthless barbarians in awe. It is a maxim in the Turkish government, that whenever the state is in danger, the rules of equity shall be superseded; and that it is better to perpetrate the most horrid cruelties, than to injure the empire at large, or suffer the dignity of the crown to be trampled on.

Selim

Selim was of such a character, as to follow this barbarous maxim of his ancestors. Being obliged to march with his troops to different parts of the empire, he gave commission to a basha to govern in Egypt; and the power of this officer was despotic. He was only accountable to the emperor, for any part of his conduct, and according to his will and pleasure he could only be changed. The kingdom was divided into twenty-four provinces, each of which was under the government of a bey, and they were accountable to the basha; their power being equally as despotic in their provinces as the basha's was over the kingdom at large. At present they are nominated by the basha, and are accountable to him as he is to the Porte. One of them goes every year to carry the tribute to Constantinople, and another accompanies the caravan to Mecca. Those who are unemployed, assist once a week at the divan or grand council of the basha, to learn the orders of the grand seignior, and to consult concerning the means to be used in executing them.

When Egypt sends her contingent of troops to the emperor's army, they are commanded by a bey; and the place of high chancellor is always filled by one of those officers. The title of bey, or beg, remains for life; but the basha can turn them out of their employments whenever he pleases.

Selim, after the total defeat of the Mamluks, having thus disposed of the first places of the government, introduced a militia on the same footing as that in Turkey. It was confined to a certain number of men, for the most part raised in Egypt, but intermixed with a few others brought from the provinces of the empire, and some Turks who remained in the country. They were divided into military classes, according to the practice of the Ottoman empire; and those divisions are known by the name of portes. But as those who are most distinguished among them are called janisaries, to make the difference between them, we shall here be a little more particular.

The power of the janisaries is much greater than that of the others, though in their discipline they are alike. But still they live in perpetual jealousy of each other, for which the janisaries are most to be blamed, because looking on themselves as the more formidable and honourable, they affect a bold haughtiness to the others; and although in valour they are much inferior to those of Constantinople, yet they glory in their title, and despise all others. Every regiment is commanded by an aga, who cannot be nominated by the basha, but is chosen by the soldiers, and then receives his commission from the grand seignior. He concerns himself only about the interests of the Porte, and for that reason always assists at the divan, presiding over councils of war, and has under him a great number of subaltern officers. Some of these are of good families; and all of them look upon themselves as persons of very great importance.

Selim not thinking it proper to have a naval force in Egypt, consequently no mariners or ships of war are to be seen there. He thought much in the same manner concerning forts; but as there are still a few subsisting, I shall here take a little notice of them. He destroyed all such places as he judged were able to make a vigorous defence; and what castles yet remain are garrisoned by janisaries. Every commandant of a garrison has the title of aga, and they have under them several subaltern officers, with whom they hold a divan or council. Their power, by right, extends no farther than the fortrefs they command; but sometimes they find pretexts to pass their limits, that they may officiously interfere in all the transactions of their neighbourhood. In every place is a *cadi*, or judge, who decides in law-suits; and his sentence is for the most part without appeal. But he generally acts with prudence and circumspection, lest the party who thinks himself aggrieved thereby should have interest enough to bring him before a higher tribunal. Thus fear of disgrace and punishment supplies the differences in the law.

At Cairo, besides the *cadi*, there is a grand master of the police, called *huabi*, who inspects the markets,

with all the public weights and measures. All such as are found guilty, are immediately punished in a severe manner. He walks often through the streets by night as well as by day, and is constantly attended by fifty executioners. He has power of life and death, and therefore his presence creates fear wherever he comes. Luckily his approach is known at some distance; for every one spreads the alarm to his neighbour, to be upon his guard.

In religious matters Egypt is governed by a *mufti*, assisted by doctors well acquainted with the alcoran. They judge in all spiritual causes, but they have no share in the secular government; for their political conduct is to keep fair with all the contending parties, sometimes leaning to the one, and sometimes to the other. But they always attach themselves to that which is most likely to become prevalent, and depart from it as soon as it loses its superiority.

Such is the account Mr. Norden has left us of the government of Lower Egypt; and we shall now follow him in his relation concerning the Arabian princes, who inhabit Upper Egypt, near the banks of the Nile, and there carry on a form of government of their own, differing in some respects from all others in the world.

I shall endeavour, according to the best information I could procure (says Mr. Norden) to give some account of those Arabian princes who either inhabit or usually infest Upper Egypt. The Arabians who live in the Delta, and for some miles round Cairo, are mostly peasants, and totally subject to the government; and they are divided into clans or tribes, each having an officer appointed to govern them. Many of them live in tents, so that at first appearance they seem to form a little camp; but having no property in hand, they frequently remove from one place to another.

When they intend to abide for any considerable time in one place, they agree with the bey for a grant of land, which is only for one season. The contract thus made, they live quietly, and go through the neighbouring villages, where they sell their goods, and purchase whatever they want. They are treated with great mildness; for having but little for themselves, consequently little can be demanded of them; and were they to be otherwise used, the consequence might be dangerous. It would be happy for Egypt, and for all such travellers as visit it, were the other Arabians to act in this regular manner, and greater tribute would be paid; by which means those demanded by the grand seignior would be much easier collected, and more expeditiously supplied.

But those Arabians called Bedouins are of too inconstant a temper, and often so knavish, as hardly to be brought under restraint. When they have committed such depredations as render them amenable to public justice, they soon put up their baggage, and set off to another place. In such cases they join with other camps, composed of wanderers like themselves; and having chosen a captain, form a considerable, nay, sometimes a formidable army. They no longer trouble themselves about tillage, but reap whatever corn they find on the ground. The governors, in the beginning of such invasions, strive to oppose, and sometimes defeat them; but in general they make a vigorous resistance, nor do they retire till they have destroyed every that comes in their way.

Such plundering prevents the officers from collecting the common tribute; and as the grand seignior makes no allowance for their differences, the loss of course falls on the basha, or other officers, who are left to find out ways and means for raising the necessary sums, which often falls very heavy on the people. Almost every year there are incursions of this sort, and when they are soon suppressed, then the loss is supportable; but when any of their flying camps have established themselves, they ruin the neighbourhood by degrees, cutting down the corn, and thereby rendering the poor inhabitants altogether unable to pay the taxes.

Many examples of these lawless insurrections might be mentioned; and when I was in Egypt, the government was greatly disturbed by one of those Arabian princes,

princes, who made himself master of a very fertile tract of land, where he encamped with his followers, to the amount of five thousand men. He had been very successful in opposing the bey of Girge, which emboldened him so much, that he set the government at defiance. Nay, the governor was obliged to come to an accommodation with him, in order to prevent the further spreading of his depredations.

Another kind of Arabians inhabit the mountains over against Ell-Gurzone, and they are the greatest villains in the world. They rob on the water as well as by land; but, happy for the people, they are not very numerous. The bey of Girge is constantly in pursuit of them, and yet they still support themselves, to the great injury of those who have occasion to sail on the Nile. I thought it necessary to give this account of these Arabians, that they may not be confounded with those of Upper Egypt, of whom I shall now proceed to take notice. They are, undoubtedly, a very remarkable people; and ever since the time of Selim they have not only kept possession, but even the sovereignty, of the country. They are extremely numerous, and although some of them are civil, yet in general no confidence can be reposed in them.

Those Arabian princes, who inhabit Upper Egypt, are called Scheichs, a name that signifies sovereign. When the latter dies, and the son succeeds, the basha of Egypt demands a tribute for the use of the grand seignior; but this is seldom paid, and indeed never but by compulsion. These princes rule as absolute sovereigns over their subjects; and so jealous are they of their power, that they do not allow the bey of Girge to come into their territories, without having first obtained their permission. And there is not a single example of his having ever granted that permission, except when the bey comes here to assist at a solemn festival. Here are a great many of these Arabian princes, but some of their dominions are more excessive than others.

They often hold conventions together, in order to take the most proper steps for their mutual preservation, and the settling all disputes between their subjects and themselves. These matters are sometimes amicably adjusted, but when any disputes arise, they are seldom settled but by open hostilities. In wars among themselves, they never suffer the basha of Egypt to send any troops to their assistance, so jealous are they lest any advantages should be taken by those who only want to bring them into a state of subjection.

They are well acquainted with the Turkish maxim, that to stir up divisions is the only way to establish their power in those parts; and therefore, whatever dissensions they may have among themselves, they make them up in the best manner they can.

Most of their disputes arise concerning the succession to the father's inheritance; for supposing a father has left ten sons, without fixing the line of succession, they immediately go to war with each other, and maintain their pretensions by force of arms. Such of the Arabian princes as find themselves powerful enough to oppose the Turks singly, are commonly flattered, and their friendship is courted by their beys and other officers. Thus the Turks pretend to a jurisdiction over them, when, in fact, they hardly maintain the shadow of it.

Having said thus much concerning Egypt, I shall now lay down some rules for those gentlemen to observe, who, from motives of curiosity, visit this once celebrated country; for as for those who go there on mercantile affairs, their consuls will always be ready to give them proper directions. A banker is very necessary in Egypt; but all those who follow that profession, by advancing money on bills of exchange, are obliged to keep lodging houses to entertain strangers: there are no inns fit for the reception of gentlemen, but the banker must provide all the necessaries of life, either in his own house, or in that of a neighbour.

If the traveller be of a nation which has a consul here, then that minister furnishes him with a protection;

and if the banker should even be a Jew, yet if he is a man of worth, he will have it always in his power to protect a stranger from insult. These advices concerning bankers being attended to, I shall next say something concerning the journey.

Begin by dressing yourself in the Turkish habit; for although at Alexandria a man may dress himself as an European, yet it is much better to be like the natives, because that prevents idle fellows from gazing at them. A pair of whiskers, with a grave countenance, will be very agreeable companions, which will make the natives believe that you are one of themselves. Thus accoutred, you can easily procure a janisary to attend you; and, if possible, let him be one who has been accustomed to attend Europeans. These janisaries are easily procured, and they generally know so much of what is called *lingua Franca*, that they can, in common things, understand what is said by a European. They accompany travellers to all such places as are lawful for them to approach, as no one durst insult you while they are in your company. If they meet a person of distinction, they know how to give an account of him to those whom they accompany; and if they are insulted by the rabble, they can in an instant disperse them, so much are they feared.

The bankers know such janisaries are to be depended on, and confidence may at all times be placed in such as they recommend. There is one thing necessary to every traveller who visits Egypt, and that is, before he lands at Alexandria, to have made himself well acquainted with the antient authors, otherwise he will not be able to form proper notions of such remains of antiquity as present themselves to his view. But the country having been much changed in its exterior appearance, since the times of the antients, he will be obliged to seek for modern assistance to direct him, and it may be done in the following manner.

He must enquire what natives of Europe ever settled in the place, who will be of great service to him. He must not, however, listen too implicitly to them, for in general they are very jealous of each other. The traveller's business is to sift them, and attach himself mostly to those who he believes are able to be of the greatest service to him.

The French consul is generally bred in Egypt, and consequently knows their language and customs much better than others. If joined to these accomplishments, he is courteous, then he becomes still more useful to the traveller, by pointing out such things as are worth seeing. Such intimations as he gives are not to be slighted, for he has it often in his power to communicate the knowledge of many things which travellers have not attended to.

At his first setting out here, many of his new acquaintances will offer him their assistance to visit the antiquities of the country; and their civility is not to be refused, nor will it be of any long duration, for they soon become tired; but the attendant janisary is faithful to the last. The janisaries are fond of smoking their pipes; and, having little to do, they have time sufficient to wait upon travellers. They never mind how long you stop at a place, for idleness induces them to wish for company.

Let travellers remember, that it is imprudent to yield to their curiosity, so far as to attempt penetrating into places to which access is forbidden by the Turks, particularly their mosques and fortresses. Travellers must also be cautious not to offer a bribe to any of the janisaries, for in such cases they will be in great danger. Never seek to visit forbidden places, unless you have received a permission, to secure you from any risque; nor will it be avails, therefore, when you take the trouble of applying for the permission, to enquire whether the object is worth it. You will observe a great deal of the marvellous in most of the conversations of your new-made acquaintances in the country, and they will tell you of a thousand wonderful things that have happened to travellers.

Were these story-tellers to be believed, very few travellers would go beyond the walls of the antient Alexandria. The boldest would never venture further than Cairo: but a sensible man should never conclude much from hearsay; let experience be his guide, and let little regard be paid to the report of the ignorant, and those who are too credulous. Very little precaution is necessary for those who intend going no further than Cairo, for the common road will conduct them in safety.

Whilst at Alexandria, there is no necessity to have an interpreter, but those who intend going any further, ought to have a valet well acquainted with the Arabic language. A stranger might be alarmed at the disputes that frequently take place in the boats, not knowing the meaning of their jargon, unless he had a person to explain it. Never lose an opportunity of travelling with Romish missionaries, or any European merchants; for, besides the advantage of their understanding the language, one can rely more on the relations of those creditable people, than on what is told them by a knavish Jew or Greek valet, who often pretend that danger is approaching, in order to make themselves seem the more important.

Let this be a rule for your conduct, not only at Alexandria, but also throughout all Egypt; never dig under any piece of antiquity, nor break off part of a flower from any monument; you must be satisfied with what you see, but never let your curiosity lead you further. You must not yield to the flattering hopes of having an entire view of the antient monuments, for the consequence would be dangerous.

A French consul having more curiosity than prudence, attempted to dig near the obelisk of Cleopatra, in order to come at the knowledge of its just dimensions, and, before he began, he took care to have permission, which was obtained with much difficulty. But notwithstanding the permission, he was not allowed to accomplish his design, for what he dug by day, the natives filled up at night.

This obstinate opposition to all attempts of that nature arises from a firm persuasion that all those monuments cover hidden treasures: nor can they be brought to believe, that mere curiosity brings people into Egypt from the remotest parts of the world, merely to dig the ground; on the contrary, they most seriously believe that the sole motive is avarice, and therefore will not suffer the ground to be dug any where. Should any person attempt it privately and be discovered, he would be looked upon as a thief; they would insist he has carried off the treasure that was concealed there; and to have the stronger claim against him, they make the treasure to amount to a most exorbitant sum.

One would imagine that the great people in this country, infatuated with such a ridiculous notion, would have the ground searched; and indeed some of them have done so: but although they could find nothing, yet they retain the same notion, pretending the treasure is enchanted, that it sinks deeper into the earth when an Egyptian comes near it, but the Franks have the art of conjuring it up. Two of their own people were once taken digging under these antiquities, and their governor ordered them to be confined, under pretence that they had acquired great treasure.

I shall say little of the danger a traveller would expose himself to, by entering into an amorous intrigue. I suppose that none but sober men go to Egypt in search of antiquities, and consequently have nothing to fear on that head; but if any person will be so imprudent as, for sake of an amorous intrigue, to forget the duty he owes to himself, he may very probably be assassinated in the streets, as many young merchants have been in Cairo and in other places. The Turks are a jealous people, and so are all the inhabitants of the eastern nations, and therefore a prudent man will lay the greatest restraint on his passions to keep himself from danger.

Strangers must avoid in Egypt, more than in any other country, all occasions of being insulted by the

natives; but if unluckily one is insulted, it is not prudent to take any notice of it; but above all things let him never strike a Mahometan, for if he escape death for such presumption, all his goods are confiscated; and, what is still worse, he is often detained a considerable time in prison. If a stranger is absolutely determined to have satisfaction, he must apply to the judge, but in that case he will find it so expensive, that he will not be tempted to make a second complaint.

Whatever else remains for a stranger to know, he will soon learn after his arrival in the country, and I thought it necessary to give him all the instruction I could, for perhaps the information would be too late when he arrives on the spot; and it is difficult, if not dangerous, to believe all that is told: for my own part, I should have been glad to have had such information given me beforehand, and I publish these cautions from honest motives of their being useful to curious travellers, who may happen hereafter to be in the same situation with myself.

The Arabians in Egypt have many things that seem peculiar to themselves, for they imagine that when the Scheich Haridi died, God out of his infinite grace changed him into a serpent, so as never to expire, but to cure all manner of diseases.

It is evident, however, that this very wonderful serpent has the faculty of distinguishing persons, and is generally more propitious to the rich than to the poor. If an Arabian prince happens to fall sick, the serpent politely offers to be carried to him, but the common people are obliged to implore his assistance, and promise to reward him for his trouble; nor is this sufficient to bring him forth, without a particular ceremony. A spotless virgin must be sent, for none but the fair has power over him; and if she has any impurity about her, the enraged serpent winds himself up with all the marks of anger.

As soon as the virgin is presented, she makes an humble courtesy to him, and in the most devout manner supplicates his condescension in favour of the sick person. This serpent, who is so devoted to the fair sex, knows not how to refuse the young virgin any thing, and begins to shew he is pleased, by wagging his tail and frisking about the room, he then springs to her neck and presses her bosom in the most voluptuous manner; he is then carried in procession to the house of the sick person, where the priests are regaled with all sorts of dainties. If a christian should come in, the sharp-sighted snake immediately spies him out and disappears, all search for him being in vain.

The Arabians impudently assert, that, were this snake cut into pieces, they would all immediately unite, for they believe that he is eternal. On the other hand, the Christians in this country reason very differently, and decide the merits of the whole transaction according to the religions they profess; they conclude that this pretended saint is the devil, who, by the just judgment of God, is permitted to impose on those deluded people; and they are confirmed in this opinion from a tradition among them, that it was to this place the angel Raphael banished the demon Armodi, of whom mention is made in the book of Tobit. For my own part, I look upon both opinions as equally wrong; (for before any thing can be declared marvellous, enquiry should be made into the reality of the fact, if the circumstances have been such as are related, and if there has been no fraud committed in the exhibiting of them.) I grant, for example, that there is a serpent, but he is not immortal; for he dies like other serpents, and the priests take care to have another trained up exactly like him, ready to substitute in his place as soon as the former dies, and this is the practice with many of the heathens in Tartary.

There is nothing supernatural in the delusions of the serpent, for whoever has seen the legerdemain tricks played by the mountebank before the castle of Cairo, must have been struck with feats more surprising than this. Is any thing more easy than to make a tame serpent observe certain signs; and as for virgins, they take care not to be deceived, by always chusing a very young

one. It is also known that certain herbs and flowers will attract serpents, and therefore there can be nothing at all surprising in the serpent's springing up to the aromatic herbs, with which the young virgin's head is adorned.

To the other question, namely, how can he escape unseen from among the people, and immediately after be found in the place from whence he was brought? I answer, it is easier than the next: we must look on all these priests attending on the serpent as so many hocus pocus gentry, and then where is the difficulty for them to remove a serpent in an instant, unseen by the multitude present? The farce carried on thus far, they retire to the tomb of their snake, followed by the deluded people, and there by their artful priests this creature is found as he was before.

To first cut the serpent in pieces, and then see the parts re-unite, would be an indisputable proof of its immortality, but that step has never yet been taken; for when once the governor of Achmin ordered that experiment to be tried, the priest opposed it, well knowing that it would have put an end to all their pretended miracles.

While we were busied in putting up our baggage at Effuaen, we were favoured with a visit from a Mahometan saint, who with one hand played on the tambourine, and in the other held a crooked stick, with which he majestically touched our coffers and ourselves, giving us a kind of benediction in his coarse manner. In the mean time, an unworthy dog belonging to one of our company, on whom he would also bestow his benediction, growled hideously at his crooked stick; he misunderstood what the saint meant, and thinking he was in good earnest to give him a hearty drubbing, flew at him and seized him by the throat; down fell the saint and the dog on the top of him, he cried out grievously, and changed his blessings into curses, whilst the mob gathering round vowed vengeance for the insult committed on their favourite saint by profane infidels, and a barbarous cruel, heretical dog. To put an end to this farce, which might have proved serious if not fatal, I sent the priest a trifle of money, with which he was very well contented, for he withdrew, and we heard no more either of his blessings or curses.

While I lay sick at Cairo, a droll adventure happened at our inn, occasioned by a publick procession, which they call the feast of the circumcision, which is reckoned one of the most solemn among them. This excited the curiosity of the steward of a nobleman, with whom I had got acquainted in Italy, and who accompanied us in our journey to Upper Egypt. The servants, in order to view the ceremony, were placed on a terracé exactly opposite to some of the apartments of the bey. This palace had frequently stood empty, but at this time one of the bey's women came to see the procession; and irritated, according to the custom of the country, to see herself exposed to strangers, ordered her eunuchs to throw stones at them by way of civil admonition for them to quit their post. The servants were sensible of the assault, but not knowing from whence the stones came, on account of the noise in the street, did not pay any attention to it at first. This filled the bey's wife with indignation at their obstinacy, and she ordered the eunuchs to fire pistols, in order effectually to dislodge them. But the pistols having been as little regarded as the stones, the lady grew quite outrageous, and construed their ignorance into a determination to affront her. Therefore, as soon as the procession was over, she sent seven or eight janisaries to take into custody the indiscreet though ignorant spectators. Sick in bed, I knew nothing of what had happened, but observed four janisaries cross my room to get into another that led to the guilty terrace. They went on tiptoe across my room, and I was so accustomed to people going backwards in it, that I did not think of any bad consequences. I saw, with the same indifference, two of the janisaries return through my room, having left the two others to guard the servants, whom they had made prisoners.

The four janisaries who had been left without doors, finding the success of the others, thought they might attempt any thing; and to complete the triumph, went into the Italian nobleman's apartment, and two of them muffled his lady, in order to carry her to a cave in the neighbourhood. Such acts of violence were neither pleasing to the nobleman nor his lady: it roused their courage, and the lady gave one of the janisaries a violent push in the belly, and at the same time run the point of her scissars into the bosom of the other, obliging both of them to take to their heels. Her husband, in the mean time, having broke loose from the two that held him, ran to his loaded carbine, which he held in one hand, with his sabre in the other, and vowed an immediate destruction to them if they did not instantly depart. This was more than enough to intimidate such dastardly wretches, and therefore they retreated precipitately. But the firing did not end here, for the two who had retired from the terrace through my room were gone to call for assistance, and that instant appeared with fifty armed men. The combat was renewed with more violence than ever, and the field of battle was over against my window. The terror of the carbine kept them at a distance, and they all cried out that if it was not immediately laid down, no quarter would be granted. One of the janisaries fired a loaded pistol, and the ball went over the nobleman's head. At this alarm I rose from my bed to see what was the matter, when upon opening the window in the heat of the action, I saw the lady push her husband into the chamber, which she made fast, and then returned to attack the enemy.

This expedient, joined to her resolution, was the safety of us all, for the husband growing more and more incensed would perhaps, have fired, and killed one or more of those scoundrels, which would have been attended with very fatal consequences; and he certainly would have done so, had he seen them present a poniard to the throat of his beloved spouse. Thus the husband was secured from danger, though not without the most violent agitations in being so.

Being thus freed from apprehensions concerning her husband, she resumed the engagement, not with more moderation, but in a manner less productive of fatal events. One of her enemies retreated weeping for the loss of part of his beard, which she had torn off, another disabled by a kick limped away, she struck her scissars against the ribs of a third, gave the fourth a box on the ear, knocked down a fifth, and indeed there was not one of them upon whom she did not bestow some of her favors, although they were not of the softer kind. Seconded at last by a janisary, whom her heroic courage had made a proselyte to her cause, in less than half an hour she drove above fifty armed scoundrels out of the house, who came to take her and her husband prisoners. The basha being informed of the lady's courage, and the servants innocence, from that day forward had us protected from all such insults, in a distinguished and extraordinary manner, which could not have been obtained, had any Turk been killed on the spot.

Another source of the aversion the Arabians in Egypt have to strangers, besides their believing that they come in quest of treasure, is, that they consider them all as so many spies, who come with an intent to return and inform their countrymen of its situation, who are hereafter to invade it, and exterminate all the natives. Nothing can put this ignorant notion out of their heads, and the following ridiculous incident will set it in a proper light.

One day as we were sailing up the Nile, the weather being calm, I was looking over some of my drawings, and rectifying the names of towns and villages, a passenger, a native of the country, rushing suddenly on me, snatched the paper out of my hand, and tore it. I was struck with amazement, not knowing what to conclude from such insolent behaviour; and while I was in suspense whether I should be angry or not, the barge-master, and others, burst into a loud fit of laughter.

laughter. I desired to know the cause, and then they unfolded the whole mystery.

It seems the poor ignorant fellow was resolved that I should not know the place of his nativity; and the reason he gave for it was, that I perhaps had a design of returning thither some years after; and that bringing an army with me, I should conquer the country; and that if he let me preserve the name of his village in writing, that I should also take it along with the rest: and that was his patriotic motive for snatching and tearing the paper, whereon I was going to write the name of his village.

I could scarce refrain from laughing at the fellow's simplicity, although highly offended at his insolence. And, to prevent any future attacks of the like nature, I ordered the barge-master to put him on shore, the vessel being hired by ourselves, and that it was through our favour he had got his passage. The barge-master was ready to obey, but the poor frightened fellow, at seeing the vessel turn toward land, guessed the intent, implored my forgiveness; and promised

better behaviour for the future. I consented to his not being turned out, and he behaved quietly afterwards, being willing to do us any piece of service he could.

Such is the narrative written by Mr. Norden, who, while living, was one of the greatest ornaments of the literary world. The Royal Society thought it an honour to have him one of their fellows, and their conduct was imitated by the other societies in Europe. He was in high favour with his own sovereign; but although his youth promised much, yet such is the instability of all human greatness, and fond wishes, that this accomplished gentleman died of a consumption soon after his return home. His thirst after knowledge was too great for his constitution to bear; and thus the literary world was deprived of one of its brightest luminaries.

Having said thus much concerning Egypt, we shall proceed to give an account of divers other parts of Africa, from several learned modern travellers who have lately visited those places.

TRAVELS THROUGH THE KINGDOM OF ALGIERS, AND SEVERAL OTHER PARTS OF BARBARY.

By Dr. SHAW, and others.

THERE are none of the modern authors who have visited the kingdom of Algiers, and other parts of Barbary, more accurately than the learned Dr. Shaw. He was a master of every part of human learning, well acquainted with history, and extremely curious in searching into every thing relating to antiquity. This stimulated him to enquire into many things on the spot. On his return home, he was earnestly urged to publish his observations on what he had seen abroad. Those persons who urged him to this, knew well what a vast loss it would be to the public, had any thing of his been suppressed. This induced him to publish his travels; and it must be acknowledged, that there is hardly any thing on the subject equal to it; we shall therefore proceed to lay before our readers, in his own words, all that is curious and entertaining in Dr. Shaw's travels.

The kingdom of Algiers is in length, from east to west, about nine hundred miles, and in the broadest place about two hundred and forty. However, (says Dr. Shaw) we found great difficulty in fixing the boundaries, for there are a great number of districts, some of whom pay an annual tribute to the Turks; but others, and indeed the greatest number of them, are independent. We found the mountains of Allas, so much celebrated both by books and historians, to be far inferior to many of our mountains in Britain; but it is natural for people to magnify any thing, when they have not had an opportunity of seeing a greater.

The frontier village of the Algerines to the sea is Twunt, fortified by a strong wall under a castle. It is about four leagues south-west of Cape Hone, which is one of the most conspicuous promontories to the eastward of the celebrated river Mulva, or Mullovia, which is large and deep, and discharges itself into the Mediterranean sea, over against the bay of Almeira, in Spain.

At a short distance from Cape Hone, we came to the river Jafna, on the western banks of which are the ruins of an antient city, called Siga, and formerly the capital of the kingdom of Numidia, now called Tack-umbrect, for all the antient names are changed.

From hence we travelled over an extensive country, diversified with mountains, rivers, and villages, till we came to Oran, a fortified town, about a mile in

length, built on the declivity of a hill, and overlooked by two castles. Less than half a furlong to the westward of this mountain, there is another castle, in a situation somewhat higher than the former, but there being a large wall between them, their respective ridges are so remarkably disunited, that they form a very convenient land-mark for mariners.

To the southward or south-east are two castles erected on the same level with the lower part of the town, but separated from it by a deep winding valley. This may be considered as a natural trench to the city; and at the upper part of it, at the distance of three furlongs from the town, there is a spring of excellent water, more than a foot in diameter. The rivulet formed by this fountain, adapts its course to the several windings of the valley, and passing the walls of the city, supplies it plentifully with water. We saw at every opening of the valley such a confined, and yet pleasing view of rocks, precipices, plantations of orange-trees, and rills of water trickling down from them, that nature rarely displays herself in such a variety of colours, or such engaging prospects. Near this fountain, there is another castle, which forbids all approaches of an enemy, and is an excellent defence to the city.

Three of these castles are regular polygons, as the other two are built with battlements and loop-holes, like some of our old fortifications in England. Oran hath two gates; that which lies nearest the port, is called the gate of the sea, and over it is built a large square tower, which may be easily fortified. The other is called the gate of Flemcan, and has an oblong battery, with several ports for cannon.

The citadel is on the north-west, and that is the highest part of the city. On all the angles of the castle cannon are placed, and the lower corner of the city, to the north-east, is defended by a regular bastion; from all which circumstances, Oran must be considered as a place of some strength; and the Spaniards, who are now possessed of it, would not have made so easy a conquest, unless there had been either some treachery or strange misconduct on the part of the Moors.

The Spaniards have ornamented the place with several beautiful pieces of architecture, in the Roman style, but neither so solid nor so strong as the antient. They have also imitated the Romans, in carving upon every

A FEMALE of MOROCCO

A Female Habit much used in Africa

every convenient place, inscriptions in their own language, the characters of which are large and legible. In travelling from Oran to the great port, we crossed a small rivulet, which rises about a furlong from the sea; but although the people call it a river, yet it has no title to that name.

The port has nothing in it remarkable, either for beauty or convenience; but the country running three miles from it, is fertile and well cultivated. In looking down upon the sea from some conspicuous eminences, we saw that it must have been a natural safeguard to the city. The water made use of by the inhabitants, is in the lower part of the country, near the city of Brachish, which seems to arise from its near connection with the sea. They draw it below the precipices from a number of wells, which, by the masonry, appear to be as old as the city; and yet they have a tradition, that their ancestors were better supplied with water, which was conveyed to them by an aqueduct, some of the arches of which are still standing, as a proof of this tradition; but these remains were so few, that we knew not what to make of them. However, to supply the want of such a necessary article of life, the founders have made the usual provision for collecting the rain water, by building the whole city upon cisterns. These still exist, but are converted to a different use, serving the inhabitants as so many hovels to dwell in.

Among the ruins are several bases, capitals, and shafts of pillars, and a well finished Corinthian capital of Parian marble supports a smith's anvil. In the *cadi's* house, we accidentally discovered a most beautiful Mosaic pavement, through the rents of a ragged carpet spread over it.

The next place we visited was Arzew, where there is nothing curious; but five miles to the eastward of it, there are several very good salt-pits, which supply the neighbourhood with that article. This commodity, from the facility of digging it, the shortness afterwards of the carriage, and the advantages of the adjacent port, would, under any other government, be a branch of trade almost invaluable, as the pits are not to be exhausted. A little to the eastward, we came to the mouths of the rivers Simkne and Habrah, which unite about two miles before they fall into the sea. Except in the rainy weather, these rivers are lost in the land. The places at which they are crossed, is called El Muchadhah, or the Sound, and is on the road leading from Arzew to Mustyganimm. The last mentioned city is built in the form of a theatre, and is said to have been made up of many villages, formerly separated, but by degrees enlarged to one. There are some unoccupied spaces here, that seem to confirm this conjecture, and in one of them particularly, which lies near the centre of the city, there are the remains of an old Moorish castle, which was built before firearms were known, as appears from the whole of the structure.

Mustyganimm affords a most beautiful prospect of the sea, and is encompassed by a strong wall, having also a castle, in which a Turkish garrison is kept. On every side, except that towards the sea, it is surrounded by hills, so that an enemy might easily attack it. The chief strength of the place consists of a citadel, built on an eminence, which has a full command of the town and the neighbourhood. The city is about a furlong from the sea, and twelve miles north of the Sound.

Muslagram, the next place we visited, is a little farther, and is a small town, inclosed with a mud wall, and flanked to the west by a range of hills. Both these places are delightfully situated in a soil extremely fertile, as well as plentifully supplied with water. The road between them, which runs along the sea-shore, is pleasantly variegated by gardens, orchards, and handsome country-seats. On the southward and south-east, they are bounded by a range of hills that stop the progress of the noxious winds, accompanying the hotter seasons, and refreshing streams steal down on every side. The castle, and some ruins on the north-west,

appears from what remains of them, to have been erected by the Romans

There is a fine fountain a little to the eastward of these places, where, according to tradition among the Moors, there was once a bloody battle fought, in which the vanquished party was totally cut off. This place is called Kalmeeta, and three miles to the north-west of it is the mouth of the Shelbiffe, which is the largest river in the kingdom.

More to the north-east, in a low swampy situation, contiguous to the sea, is Tennis, which was formerly the metropolis a petty kingdom, before the conquests made by Barbarossa. It consists at present of only a few huts, and is watered by a brook which falls into the sea near a small adjacent island. The harbour is very dangerous, being not at all defended from the north and west winds, which prove fatal to many vessels that touch here in the stormy seasons; and from hence large quantities of corn are sent into Europe. The Moors have a tradition, that the natives of this place were formerly in such reputation for sorcery, that some of them were employed by Pharaoh to work miracles equal to those done by Moses. They are at present the most notorious thieves and cheats in the world, and no person can trust them. Near this plain is the most remarkable promontory in all Barbary. It is a high rocky mountain, stretching a good way into the sea, and is called by modern geographers Cape Tunis; but the Moors distinguish it by the name of Bell, alluding to a grotto found in the lower part of it.

Travelling still more to the eastward, we crossed a river called Tefert, which is very dangerous in the rainy season, because of its overflowing its banks. Five miles distant is Shershall, a city famous for steel, earthen-ware, and such utensils of iron as are used by the natives. It consists of low tiled houses, which take up about a mile of ground, but was formerly of more extent than at present; though it is still very populous, and the people seemed to be more industrious than any we had hitherto met with.

It is certain that this must have been once the situation of a city equal in grandeur to Carthage, if we may be allowed to form an opinion of its magnificence from the remains of its pillars, capitals, cisterns, mosaic pavements, and many other works, which are still to be seen. The water of the river Hushem was conducted hither through a large sumptuous aqueduct, several fragments of which still remain among the neighbouring mountains and villages to the south-east, which are incontrovertible proofs of the beauty and grandeur of the work. There are two other fountains to the south-east that furnish Shershall with water: and nothing surely could have been more inestimably valuable in such a country as this is, where the heat is extremely violent.

The situation of this place was nobly adapted for strength and beauty, and it was secured from the encroachments of the sea by a strong wall, near forty feet high, supported by buttresses, and winding two miles along the shore. Two furlongs within this wall the city begins on a level, and afterwards rises gradually for near a mile to a considerable elevation. One of the principal gates on the land-side is near this elevation, and leads to the rugged mountains of Beni Menasser. One of the gates towards the sea-shore lies under the shade of the mountains of Beni Yfrath, and the other under the mountains of Shenooah.

Shershall being thus shut up by mountains and passes difficult of access, all communication with it may be easily cut off, whenever the neighbouring tribes chuse to be troublesome, a disposition in which they are often found. From this we may naturally conclude, that Shershall is no other than the antient city called by the Romans Julia Cesarea; and the following words of Procopius confirm this opinion, who says, that the Romans could only approach it by sea, all the avenues by land being in the hands of its neighbours. To this we may add, that the caravans are

thirty days in their journey between Sherhall and Tunis, the neighbourhood of the antient Carthage; and it took up the same space of time for the Romans to travel from Carthage to Cesarea. They have a tradition, that the city was formerly destroyed by an earthquake; and that the port, which was before large and commodious, was thereby choaked up with the ruins of buildings.

This seems to be confirmed from there being many ruins still seen at low water near the Cothon, which communicates with the western part of the port, as they could not have been brought hither by any other accident. The Cothon was well contrived for the convenience and safety of the vessels that anchored in it; and the founder's ingenuity in supplying it with water is worthy of admiration. For this purpose several floors, and mosaic pavements, were laid upon an eminence, forming the northern channels of the port and the Cothon, in which the rain-water fell. From thence the water was conveyed by means of some small conduits into a cistern capable of containing many thousands of tons. The diameter of the port which is of a circular form, is two hundred yards; but that part of it which was formerly the most commodious, is now filled up with sand.

Leaving this place, we travelled twelve miles eastward to Tefessad, which appears to be the Toposse of the antients. We are told by many authors, that the Christian inhabitants of this country were, in the fourth century, persecuted by the Arians, who ordered their tongues to be cut out; and notwithstanding this piece of cruelty, Heaven endued the persecuted with the faculty of speech, and enabled them, tongueless as they were, to relate an account of their sufferings. It is not our business to make any remarks upon this; for it is well known, that many of the primitive Christians had good hearts, but not clear heads.

From Tefessad to Algiers the whole coast of the Mediterranean is very irregular, there being sometimes woods for several miles together, and mountains of an equal extent. This, however, is attended with one convenience, namely, that the fine plains of Metejiah, that lie behind them, are conveniently screened from the more immediate influence of the boisterous northern blasts blowing from the sea.

South-east of Tefessad, about seven miles upon the mountainous part of the sea-coast, lies the Kuber Romiah, or Roman sepulchre of the Christian women. It is a solid compact edifice, built of free-stone, the height being one hundred feet; and although the Turks have demolished part of it in hopes of finding some treasure, which they suppose to have been buried underneath, yet it is still sufficiently high to serve as a land-mark for mariners. From the elegance of the workmanship, the goodness of the materials, and the form of its construction, we have room to suppose it more antient than the Mahometan conquests, and probably the same monument that was used for the interment of the Numidian kings; for the Turks take little pleasure in architecture, which is the reason why they have so few celebrated structures.

Such is the account given of a few of the northern parts of Barbary by Dr. Shaw; and before we proceed more to the eastward, we shall follow him to the more southern provinces, which is the more necessary, because few travellers have penetrated so far into that part of the country as himself. Nor are vague, uncertain accounts, written by men of no reputation, to be held in competition with what a gentleman of learning, knowledge, and antiquity, saw, and lived to see esteemed and applauded by the public.

Leaving the northern part of the country (says Dr. Shaw) we travelled southward to Tremesen, a city situated upon a rising ground, below a range of rocky precipices. Upon the first ridge of these is a large stripe of level ground, watered by several springs, which flowing some little way in distinct streams, at length unite, and become forcible enough to turn several mills; and as these streams approach the city, they form several cascades, which afford an entertaining

prospect. There is something romantic in beholding them; and it is no wonder, that from such views as these, genius has been elevated to the highest pitch of enthusiasm in poetry.

The city is well watered on every part from a reservoir, which is filled by subterraneous channels connecting with the neighbouring mountains. In the west part of the city there is a large square basin, of Moorish workmanship, two hundred yards long, and one hundred broad. The inhabitants have a tradition, that here their antient kings were wont to take the diversion of sailing, and their subjects learned the art of navigation. Probably this basin was designed for a reservoir of water, in case of the city's being besieged, because the resources with which it was otherwise supplied might have been easily cut off by the enemy. The walls of this city are, for the most part, composed of mortar made of sand, lime, and pebbles, to which time has given the strength of stone. To prevent intestine commotions, the city was divided into several wards, each of which being surrounded by a strong wall, might have been considered as a separate city within itself.

The antient Tremesen was about four miles in circumference; but little more than one-fourth part of it now remains, it having been for the most part destroyed by the dey of Algiers, on account of an insurrection against government, that happened there in the year 1670.

Among the ruins are found many fragments of Roman antiquities; and in the walls of an old mosque we discovered several altars, dedicated to *Dii Manes*. In the village of Hubbed, a little to the eastward of this place, there is a tomb much revered by the Mahometans; and a mile to the westward is an inclosed area of two miles in circumference, in the center of which is a high tower, and a plentiful fountain. On this spot once stood the city of Munfourah, nothing of which, not even a house, now remains, except some parts of the walls.

Here the beautiful plains of Zeidoure begin, upon the banks of the river Isser, and extend themselves through an interchange of hills and villages, during a course of thirty miles. About the middle of these plains is a high pointed precipice, called the Pinnacle of Ravens, below which runs the Sinun. This waters a piece of ground on which formerly stood a city of the same name, but no remains of it are now left. At a little distance from this is pointed out the place where Barbarossa, to elude the pursuits of his enemies, scattered about his treasures, a device however that could not secure his escape. There is a Moorish sanctuary on the other side of the river, standing upon an eminence, and is inhabited by a sort of Mahometan monks.

All these places, as well as the adjacent mountains, are possessed by different tribes, who live independent of the dey of Algiers. The next place we visited was Ell-Callah, built upon an eminence, and surrounded by hills, being but ignorantly contrived, having neither drains nor causeways to carry off the filth. It is a great market for carpets, in the manufacturing of which the inhabitants of several villages are employed.

Five leagues to the south-west of Ell-Callah is a town called Mascar, the walls of which are composed of mud; and there is a fort, but the Turks are not allowed to keep a garrison in it. Thus we find that many of these people live as it were independent of any government whatever; for they pay no more regard to the dey of Algiers, than they do the grand seignior.

From this place we travelled north-east to Tagalemt, a large city, which was some years since plundered by the Arabs, who have left behind them proofs of their ignorance and barbarity, in burning down and destroying all the valuable remains of antiquity, wherewith this place was once magnificently adorned, leaving every thing as a heap of rubbish.

Near this place resides a powerful body of Arabs, who pay no sort of tribute, but sometimes serve as volunteers

volunteers in the Algerine armies, in order to procure a little plunder, for they are thieves by nature. In the same neighbourhood is another tribe of Arabs, who never cultivate any part of their grounds, but live either by keeping their flocks, or plundering their neighbours. They are, in all respects, like those Arabians who live in Upper Egypt, being utter strangers to civil government, and unacquainted with society.

About six miles farther, are the ruins of a Roman station, with the Shelliffe running under it, and near it are several sepulchral monuments. The Arabs supposed, that these monuments had been built over some treasures, and in this they were confirmed by a person who explained to them the following inscription: "My treasure is my shade, and my shade is my treasure; search for it; despair not: nay, despair; do not search." This set the ignorant creatures to work, but alas! all they could discover was, the ashes of the dead.

Five miles farther, on the banks of the river, are the ruins of two large cities, viz. Memnon and Sinaab; the latter of which seems to have been the most considerable, being at least nine miles in circumference, though we only saw some pieces of walls and cisterns remaining. Here is a market kept every Thursday, for the benefit of the inhabitants, that being to them as Saturday is to us.

Three miles from Sinaab, on an eminence, is a mud-walled village under the Turkish government, called Marjejah, but it does not contain any thing remarkable, only that the grounds adjoining to it are the property of one of the most powerful tribes of the Arabs in this part of the country, although they have been mean enough to give up their freedom. Boni Arax is situated about eight miles south-east of Marjejah, and two miles north of the river Fuddah. This place was in some repute in former times, having had a citadel, and two thousand inhabitants, who were a warlike race of people, that commanded the country as far as Mascar. At present it is considerably reduced; the citadel is in ruins, the houses changed into huts, and the inhabitants are become timorous and cowardly. The nature of the soil is, however, still the same, and produces fruit, particularly figs, both large and delicate.

Descending the mountains of Beni Rached to the north, we arrived at a fertile plain, whereon once stood El-Herba, a Roman city, something more than a mile in circumference. Here are several pillars of blue marble, of excellent workmanship; but their capitals, which are of the Corinthian order, are much decayed.

Travelling still more to the north-east, over a fertile plain, through which the river Steiffe pleasantly winds, we arrived at Mulzama, built upon a mountain two leagues from El-Herba. At a distance, it has the appearance of a multiplicity of buildings and antiquities, from inspecting of which, a virtuoso may promise himself something, but he will be wretchedly deceived in the end, the place consisting only of a few houses covered with tiles. However, it has many advantages; being well watered, in a wholesome situation, commanding a delightful prospect, surrounded by pleasant gardens, and delightful vineyards.

Hither the people of Bleda and Algiers repair in great numbers, to pay their devotions to Sede Youafeph, one of their favourite saints. Here are some fragments of Roman architecture, and from an inscription upon one of them, it is probable, that the grandson and great grandson of Pompey the Great lie interred here. It is impossible to reflect on the misfortunes of this hero and his family, without being sensibly affected; and here the vain, who are desirous of temporal glory, become a little more cool, or, at least, they should moderate their pursuits.

Heroes are much the same, the point's agreed,
From Macedonia's madman, to the Swede;
The whole strange purpose of their foes to find,
Or make an enemy of all-mankind.

Regardless of the past, still on he goes,
Yet ne'er looks forward farther than his nose.

POPE.

Eight miles north-east of Maliena, halfway between Stocli and the sea, are the baths of Mireguca, well known by the name of Aqua Calid Calonis. The largest and most frequented of these baths is a basin twelve feet square, and four deep. Here the waters bubble up in a degree of heat just supportable, and hence pass off, having first filled a neighbouring cistern made use of by the Jews, who are not allowed to bathe in company with the Mahometans. Both these baths are now open to the weather, and half filled with stones and rubbish, though, in former times, they were well covered, and kept in excellent order. Numbers of people, afflicted with different disorders and bad habits of body, resort hither in the spring time, and are said to find some alleviation of their grievances. Higher up the hill is another bath, the water of which, being too hot, is conveyed into another room, where it is made use of in the same manner as our purging waters.

Between these two baths, there are the ruins of another Roman town, equal in size to El-Herba, wherein are found tombs and stone coffins of an unusual size; but this does not in the least prove, that the persons buried there were of a gigantic stature. The bigness of the bones that are often dug up among the sepulchres of the people, who have been buried in those places, may be easily accounted for, if we only reflect, that it was the common practice of the Goths and Vandals to bury his horse along with the deceased soldier. Possibly this custom passed over with them into Africa, the natives of which not being very expert anatomists, might confound, as they certainly did, the bones of the horse with those of the man; and this opinion, with respect to interment is confirmed by the many long swords, with handles shaped like crosses, that are often taken up in this country along with those gigantic bones.

These baths are surrounded with steep precipices, neither to be climbed or crossed without much difficulty, which however is compensated by a succeeding view of the delightful plains of Metijah, stretching away to the southward for more than fifty miles in length, and twenty in breadth, well watered by several winding rivulets and wholesome springs. Here are many fine country seats and farms, that supply Algiers with provisions, besides fruit, pot-herbs, rice, and grain of every sort. The soil also abounds with flax. Indeed, the whole neighbourhood of Algiers is so finely cultivated, that it appears somewhat like a terrestrial paradise, but that leads us to give a description of that celebrated city.

Algiers, surnamed by the Turks the Warlike, has, for many ages, braved the powers of Christendom; notwithstanding vigorous attempts have been made to seize upon it. This city is not more than a mile and a half in circumference, and yet, according to the best accounts we could procure, contains no less than one hundred thousand Mahometans, fifteen thousand Jews, and two thousand Christians, but these latter are slaves. It is situated on the declivity of a hill, whereby the houses, rising gradually one above another, have, almost all of them, a full view of the sea. The walls are rather weak, but in some places they are strengthened by additional fortifications.

The Cuffabah, which is built upon the highest part of the city, and makes the western angle of it, is of an octagonal figure; each of the sides in view having their port-hole. The gates near the river, are each of them defended by bastions, upon which are placed several pieces of ordnance. The ditch that formerly surrounded the city, is now almost entirely filled up, but still the place is exceeding strong.

About a furlong to the north is a castle, built for the most part in a regular manner, and very capable of making a defence against any common enemy, both in their landing and in their attempting to make a settlement.

settlement in the place. Half a mile to the westward is a sandy bay; betwixt which and Algiers, the road is tolerably good, so that thirty men may walk abreast.

There is a castle for the security of the road, but it is a place of no strength. Both these bays are overlooked by a ridge of hills, laying nearly upon a level with the Cassabah already mentioned. Two Convenient castles are built here, one of which is called, from its five eccentric angles, the Castle of the Star, is within a furlong of the Cassabah, and connected with the bay. The other, called the Emperor's Castle, hath a full command of the Castle of the Star and the Sandy Bay towards Ain-Rebalt.

The emperor Charles V. in his unfortunate expedition in 1541, against this city, landed his army at Ain-Rebalt, where there still remains a fragment of the pier supposed to have been erected for that purpose. The better to secure a correspondence with his fleet, and to succour his troops in their intended approaches towards the city, he possessed himself of the ridge already mentioned, where he built the inner part of the castle that still continues to be called after his name.

Such is the strength and situation of Algiers toward the land, but towards the sea it is much better fortified, and capable of making a more vigorous defence; for the embrasures in this division are all employed, and the guns of brass, with every thing suitable to them. The battery of the Mole-gate, upon the east angle of the city, is mounted with several long pieces of ordnance, one of which hath seven cylinders, each of them three inches in diameter. Half a furlong to the south-west of the harbour, is the battery of Forliòs-gate, or rather the Gate of the Sea, which consisting of a double row of cannon, commands the entrance of the port, and the road before it.

The port is of an oblong figure, one hundred and thirty fathoms long, and eighty broad. The eastern mound of it, which was formerly an island, is well secured by several fortifications. The castle built by the Spaniards, while they were masters of the island, and the two remote batteries erected within this century, are said to be bomb proof, and have each of them their lower embrasures mounted with thirty-six pounders; but the middle battery, which appears to be the oldest, is the least defensible. None of these fortifications have ruins or advanced works, so that it is difficult to keep the soldiers, who are appointed to do duty, to regular discipline, which is much the same in all those countries where the Mahometan religion is professed.

Some years ago, the naval force of the Algerines was rather in a declining condition, but at present it is on a very respectable footing. Their ships are not large, few of them being above thirty guns; but they have so many men on board, that they are capable of doing a great deal of execution. Their officers know very little of military or naval discipline, and yet we find, that the Christians can seldom succeed in any engagements with them. This will appear the more evident, when we consider there are always a vast number of Christian slaves in Barbary, whereas neither the Spaniards or Italians have, at any time, more than a few of the Moors.

There is little within the city that merits a particular description, or worthy the notice of a curious traveller. There are several inscriptions on the great mosque, but they are either so much mutilated, or covered over with plaister, that we could not make any thing of them. Their officers who act in a civil capacity, are much the same as in other parts of the world where the Mahometan religion prevails.

Algiers, from its distance and situation, with respect to the Tefessad, should be the antient Icosium, which was forty-seven miles from Tepasá Leo; and several authors inform us, that it was formerly called Mesgana, from an African family of that name. Its present name, which should be pronounced Al-je-zeire, signifies an island, so called from being in the neighbourhood of the eastern mound of the harbour, which, till after the place was taken by the Moors, was sepa-

rated from the continent. In their records and public letters, they stile it the Island in the West, to distinguish it from another of the same name near the Dardanelles.

The hills and valleys round Algiers are every where beautified with gardens and country-seats, where the inhabitants of better fashion reside during the summer season. The country-seats are little white houses, shaded by a variety of fruit-trees and ever-greens, whereby they afford a gay and delightful prospect towards the sea. The gardens are well stocked with melons, fruit, and pot-herbs of all kinds; and, what is chiefly regarded in those hot climates, each of them enjoys a great command of water from the many rivulets and fountains which every-where present themselves in this situation.

The fountain-water used in Algiers is reckoned extremely good, and is brought into the city through a great number of pipes, from the sources already mentioned. Four miles to the south of Algiers is the river Huratch, which rises behind the mountains of the Beni-Moufah, and joining the Fig-River, runs through the richest part of Metijjah. It had formerly a bridge over it, at a small distance from the sea. Bleeda and Neda are the only inland cities in this province, and are each about a mile in circumference; but their walls being chiefly of sand, cannot be supposed to contribute much to their security. Some of their houses are flat-roofed, others like those of Maliana, and all around are the most beautiful gardens and rich plantations.

The branch of an adjacent rivulet may be carried through every house and garden at Bleeda, whilst the several conduits and aqueducts that supply Media with water, some of which appear to have been the work of the Romans, are capable of being made equally commodious. Both these cities lie over-against the mouth of the Masafian. Bleeda is five leagues distant, under the shade of Mount Atlas, and Media about three leagues beyond it, on the other side of the mountain.

Jurjura, the highest mountain in Barbary, is at least eight leagues in length, lying nearly in a north-east and south-west direction. It is from one end to the other a continued range of naked rocks and precipices, and secures, by its situation, a great number of Kabyles from becoming tributary to the Algerines. Of these the Beni Alia and the Beni Siftaka are the most noted on the north-east side, towards the Benikoosey, as the Beni Yali are to the south-east, towards the walled Mansoure; on which side, near the middle, there is likewise a pool of good water, bordered round with arable ground.

The ridge of this mountain is covered with snow; and it is very remarkable, that the inhabitants of the one side should maintain an hereditary and implacable animosity against those of the other, and are continually at war with each other, except during the winter, when the snow puts a stop to their hostilities. Jurjura, as well from its extraordinary ruggedness, as from the situation of it between Dellys and Beujeiats, should either be part of the continent Mons Ferattus, mentioned by Strabo, or perhaps the whole. Eight miles to the south-east of the Boudarna, and at the like distance to the south-west of Media, are the fruitful districts of Wamre and Amoura, both watered by the Harboone.

This river is chiefly collected from the fountains of Media; and near the western banks of it, as it passeth through Amoura to join the Shelliffe, there are some considerable ruins, watered by a pleasant stream. The Arabs call them Herba, a name common enough to other places, and which means something broken up, or pillaged. Several leagues to the south of Media is situated the Burgh Swarry Castle, in a province of the same name. It is a small fort, built upon the skirts of the Sahara, and was a few years ago one of the frontier garrisons of the Algerines.

About six miles more to the eastward are the rocks of Tetterie, called by the Turks Tetterie Dork. They consist of a ridge of precipices, running parallel with the

the plains of Beric Halecfa. They are twelve miles in length, and are, if possible, more rugged than Jurjura. Upon the summit of them there is a large piece of level ground, with only one narrow road leading to it, where, for the greater security, the walled Eisa have their granaries. Beyond the walled Eisa are the encampments of the walled In Anne, the principal Arabs in the district of Titterie, properly so called, because it lies in the neighbourhood of this mountain.

Another considerable clan of Arabs, made up of a variety of families, spread themselves over Getulia, from the Bergh Swaary to the mountains of the Amner, extending thirty-five leagues to the southward. There being no inns in this country, we were obliged to encamp in the evenings; but nothing is more dangerous, because the Arabs have but one notion within them, and that is, to steal. Although we had a guard along with us, yet we were frequently robbed; for they are so cunning as to watch every opportunity.

Continuing travelling more to the southward, we came to a ridge of mountains, where begins the country of the Beni Mezzob, a tribe of the sect of Melarti, which pays no tribute, its members being, from time immemorial employed in the slaughter-houses of the Algerines, but are not permitted to set foot in the mosques. They are more swarthy than the people inhabiting Getulia, farther to the northward, from whom they are divided by a wide inhospitable desert.

The next province we visited was Constantia, which is upwards of two hundred miles in length, and about one hundred broad. It is so fertile in corn and other fruits of the earth, that the governor pays yearly into the treasury at Algiers one hundred thousand dollars in money; whereas the bey of Titterie pays only twelve thousand, and the wesity bey between forty and fifty thousand. The sea-coast is rocky and mountainous; but no part of the Spanish dominions can be discovered from them, although some writers have asserted the contrary, probably because they never were off the spot.

The river, called Booberak, is the western boundary of this province; and at a league's distance on the sea coast, at the foot of a high mountain, the town of Delly rises out of the ruins of an antient city, where, just over the harbour, in an old wall, is a statue, much defaced, which seems to have been designed to represent a madona. The drapery and features are very much damaged, so that it is indeed difficult to make any thing of it. The inhabitants here complain much of the want of water, which indeed is the case in general over the greatest part of this province.

We thought to have discovered some ruins here, but they were so defaced by being incorporated into the walls of the houses, that none of the inscriptions are legible. Towards the eastern part of this province, we visited a promontory covered with ruins, and called by the Moors, Ash-oune-mon-kar; and in sight of it is a rocky island. In this island is a cave, where, according to the traditions of the Romish priests, some of their missionaries used to reside. Here again we were continually in danger from the different tribes of Arabs, who continually infest this place; for although the Algerines have a garrison here, yet the numerous tribes of those people keep it almost continually blocked up. Here a market is kept, the business of which is conducted with great order; but no sooner is it over, than these wild Arabs begin their outrages, and the day seldom concludes without some instance of their barbarity.

The adjacent country produceth a plenty of wax and oil, and the mountains afford good iron, of which they make mattocks, ploughshares, and other instruments, in which the inhabitants drive a considerable trade. This town seems to be more antient than Algiers, because Abulfedah, an Arabian wrestler, mentions Boujecah, but takes no notice of Algiers; so that in his time it was either not built, or else it was in very little repute. The only thing remarkable here is the tomb of a certain saint, called Seedy Buf-

grec, to which there is a great resort of people; and here are still some remains of an aquaduct, and several other ruins. Bujciah is called by the Europeans, Buga. It is built on the ruins of an old city, and in a situation very much resembling Dellys, but the circumference has been much larger than it is at present. Great part of the wall is still remaining, and is carried up to the top of the mountain. Here are three castles, one on the top of the mountain, commanding the city, and two at the bottom, to secure the port. Sir Edward Spraggs once cannonaded this port, and the marks of his firing are still visible on the walls of one of the castles.

From this place we travelled through a great number of small villages, in which we saw nothing remarkable; and came to the river Zoore, which rises among the mountains of Beni Welboan, and being carried in its course through a high craggy tract of land by several small rivulets, at length empties itself into the sea, being first swelled to a very considerable river. The Arabs who dwell near this river, live in caves; and if they spy a ship at a distance in stormy weather, vast numbers of them flock to the shore, praying to heaven for its destruction; and there is no mercy to be expected from them, for they are void of humanity, strangers to the feelings of pity, and indeed such savages, that they hardly deserve the name of men.

Near this place, on a neck of land, between the rivers Sei-boure and Boojemak, are still to be seen the ruins of the antient city of Hippo, of which St. Augustine was bishop; and the Moors shewed us a place where, according to their traditions, his convent stood; for which we were obliged to give them some presents. It was called Hippo Regius, on account of its having been once the residence of the Numidian kings. That St. Augustine had a convent here, cannot be disputed, because he mentions it in several of his writings; and it is well known that celebrated father was a great promoter of the monastic life. He had in his youth given himself too much up to pleasure; but about the thirty-sixth year of his age he entered into holy orders, and was chosen bishop of Hippo, where he was of great service to the church, though indeed he was rather too superstitious, which, undoubtedly, was the fault of the age in which he lived, and partly owing to the warmth of his natural temper. Upon the whole, however, he was a very great man, and his excellent writings, in some parts, shew that he had clear notions of the gospel.

Silius Italicus, speaking of Hippo, says, it was a place of which the Numidian kings were extremely fond, which we need not be surpris'd at, when we consider that it was well fortified, extremely healthful, and well situated for trade, commerce, hunting, and all sorts of diversions. The prospect of the sea is the most grand and majestic that can be conceived; the mountains around it are covered with trees, and the places finely watered.

Travelling along the coast, which is very irregular by reason of the vast number of capes, we doubled one of them, called Rosa, and entered a small creek, where are still to be seen the ruins of a tent, which formerly belonged to a French factory settled here by their African company; but the unwholsomeness of the place, owing to the damps arising from the neighbouring ponds and marshes, obliged them to remove to another place, called La Calle. Here is another inlet about six miles eastward, where these French gentlemen have a magnificent house and gardens, a company of soldiers, a good quantity of armour, and several pieces of ordnance. They command the trade of the whole country, and reap vast advantages from the coral fishery, in which they continually employ at least three thousand men. They buy up all the corn, wool, hides, and wax, exclusive of every other person or power, for which they pay to the dey of Algiers, and to the chiefs of the Arabs, five thousand guineas annually. Some of the tribes in this neighbourhood are subject to the bey of Tunis, and are extremely savage and inhospitable.

From the sea coast all the way up to Seteef and Constantina, the country is one continued chain of high hills, the access to which being almost impracticable, the inhabitants to the westward pay no regard to the Algerines, and refuse to pay them tribute. Towards the east the Turks have always a flying camp, during the summer season, on which account some of the Arabs are obliged to pay them some tokens of homage; but they are so tenacious of their rights, that they never comply with these demands till forced to it by the sword. The prospect here is the most beautiful that can be imagined, for the traveller is at once presented with a view of hills, vallies, rivers, gardens, and long tracts of well cultivated lands.

The most powerful tribe of Arabs in this province are the Zowowah, who possess a large tract of high mountains, from whence they frequently come in large bodies and annoy the Turks, who might as well be at home as to come among them, for they never collect sufficient to defray their expences.

Here is a mosque with a Turkish convent, and the sepulchre of one of their saints; but neither of them contain any thing remarkable. The Arabs who inhabit here are a very powerful clan, being able to bring three thousand horse and fifteen hundred foot into the field; and as they live directly on the great road to Constantina, they are frequently engaged in war. Their capital city is Callay, where they make the most excellent fire-arms; and among their mountains, there is a narrow defile, which winds about half a mile under a high precipice. It is in several places crossed by a rock, through which a passage is cut like a door case, about the width of six or seven feet. These apertures the Arabs call simply the gates; but the Turks, in consideration of their strength and ruggedness, give them the additional epithet of iron. Here a handful of men might dispute the passage of a whole army, and indeed there is something horrid to behold in going through them. A little further there is another dangerous pass, where the road lies upon a deep ridge of mountains, and such dreadful precipices on every side, that should the traveller miss his way, he will be in imminent danger of perishing.

The Arabs in these mountains are so fierce and so much addicted to robbery, that it is dangerous for a traveller to venture among them: they call themselves Mahometans, but it may be justly said that they have no religion at all, although we could not learn that they commit murder: probably this is owing to the following cause. They go out in great numbers together, so that they can easily overpower a caravan of travellers, and take from them their most valuable effects; but as their lives could be of no manner of use to them, they content themselves with obtaining possession of their goods.

Beyond these mountains dwells the tribe of Amner, who are both numerous and powerful: in their manners they are infamous to the last degree; for, contrary to the law of Mahomet, they prostitute their wives and daughters to every one who will give money for the enjoyment of them. There are many ruins here, but none that claim the notice of a traveller except those of Seteef, once the metropolis of this part of Mauritania, and the Sitipha of the ancients. This city was built upon a rising ground, about a mile in circumference, but the Arabs have destroyed all the Roman works so effectually, that they have not left a single fragment of antiquity standing. Here were several fountains and cisterns in this city which were equally delightful and convenient, and from whence water was conveyed to the houses of the inhabitants, but they are now totally demolished.

It is remarkable that the natives of the sea coast are in general of a swarthy complexion, with dark hair; but when we advanced up to the mountains, we found them fair and ruddy, with yellow hair. From this circumstance we are led to imagine that they are some remains of the Vandals, who united in bands and settled in these mountains. At a little distance from

this place are some other mountains, where we saw a vast number of baths, the fountains from whence they are filled are entirely hot, and there are some springs near the river Zenoti, into which they all empty themselves, and thence are entirely cold. Here are some houses built on the banks of the river for the reception of those who come here to bathe, but none of them merit a particular description.

Constantia, of which we shall next speak, is situated a considerable way from the sea, and was in ancient times reckoned one of the strongest cities of Numidia. It is about a mile in circumference, but ending to the northward in a precipice of about a hundred fathom perpendicular.

Here we were presented with a most beautiful landscape, consisting of a diversified scene of woods, rivers, hills, groves, villages, and cultivated lands; and extended so far, that it was lost in its extremity to the eye: to the eastward, the prospect is bounded by an adjacent range of rocks much higher than the city, but towards the south east the country is more open, and presents a distant view of the mountains of Seedy Rugoure, and the peninsula of Egarieh is separated from the neighbouring plains by a deep narrow valley, perpendicular on both sides, throughout which runs the river, and here was formerly a bridge of excellent workmanship.

The neck of land to the south west, near which stood the principal gate of the city, is about the breadth of half a furlong; being entirely covered with broken walls, cisterns, and other ruins, which are continued quite down to the river, and carried on from thence over a slip of plain ground, that runs parallel with the deep narrow valley already described. This city was antiently called Cirta, but it has fallen so much from its former grandeur that at present is little better than a contemptible village.

Besides these there are several other remains of antiquity in this place, particularly some cisterns, which seems to have been placed about the middle of the city; they are about twenty in number, and some in area of fifty yards square, having upon each of them the marks of Roman architecture. The aquaduct is in a still more ruinous condition than the cisterns, but the remaining fragments are sufficient to point out that the persons who constructed them must have been endowed with a large share of public spirit.

Upon the brink of a precipice to the northward there are the remains of a large and magnificent edifice, where a Turkish garrison is constantly kept. Four of the bases, each five feet in diameter, with their respective pedestals, are still in their places, and seem to have appertained to the portico: they are of a black stone, little inferior to marble, hewn in all probability out of that range of precipices upon which they are founded. The side parts of the principal gates of the city, which are of a most beautiful reddish stone, not inferior to marble, are very neatly mounted; and an altar of pure white marble makes a part of the neighbouring wall.

The gate towards the south east is of the same fashion, though much smaller and laying open to the bridge, which according to the antients was built over part of this valley. The bridge was, indeed, a masterpiece of its kind, having the galleries and columns of its arches adorned with festoons and garlands; the key stones of the arches are extremely curious, all of them being adorned with carved work, and betwixt the two principal arches is the figure of a lady treading upon two elephants, with a large scollop shell for a canopy; the elephants having their faces turned to meet each other, and the lady, who appears as dressed in a close-bodied garment, like the riding-habit of our times, and no covering on her head, raises up her petticoats with her right hand, and looks fearfully upon the city: this group of figures in any other situation might be supposed to have belonged to some fountain, it being well known that sometimes such ludicrous figures were engraved upon them; and the reason was, that every attempt was made to stir up amorous desires and corrupt

the morals of the people by gratifying their vicious passions.

A little below the bridge the river begins to run in a northern direction, in which it continues about a quarter of a mile, through a subterraneous passage, which nature seems providentially to have prepared for it; since otherwise the waters must have formed a prodigious lake, and overflowed the country before they reached the sea.

Among a parcel of ruins to the south west of the bridge, there are the remains of a triumphant arch, embellished with a variety of flowers curiously carved: under the precipice are several medicinal springs, near the monument of a Mahometan saint; and about a quarter of a mile to the east the Rummel falls from its subterranean passage in a fine cascade, and all those who are guilty of capital offences are here thrown over a precipice, where if their brains are not knocked out, they are sure to be drowned.

Leaving Constantine to the north west, we entered upon one of the most extensive and the most fertile districts in Numidia, peopled by a gallant tribe of Moors, who have often been of great service to the Algerines. The whole of this country is well watered, and had formerly several plantations of woods and trees. Here we had an opportunity of conversing with several of the Mahometan priests concerning the truth of the Christian religion; but they are in general so ignorant, that we knew not what to make of them. When we observed to them, that their religion could not be of divine original because it was propagated by fire and sword, we received for answer, that our religion had been propagated in a still more cruel manner, though not originally. Here we found that they alluded to the papal persecutions; and when we told them that popery had no further connection with Christianity but its name, they only smiled, and said that had we not forsaken God, he would never have given us up to so many delusions. "You are idolators (said one of the Mahometan doctors,) for you worship images, although you know that it is forbidden in your own law." Perhaps there might have been too much truth in this, but then it must be considered that the Mahometan did not know any more of the Christian religion than what he had acquired in consequence of his conversing with some Romish missionary priests.

The midland boundary of this kingdom is the river Serratt, the waters of which are brackish, and discharge themselves into the Me-gerdath. Near the western banks of it, upon an high pointed mountain, which can be approached only by one narrow road, is a considerable village called Callah, which on account of its strength and situation serves as a refuge or asylum for all the outlaws in Algiers and Tunis; and here they remain till they have either compounded for their crimes, or otherwise procured for themselves a pardon. One of the most remarkable frontier towns of the Algerines is Tepfa, where a garrison is constantly kept, and here there are some remains of antiquity. The situation is fine, and the prospect is grand, in consequence of the vast number of mountains that appear at a distance. Here are many fine gardens, and when we consider what delicious fruits they yield, we shall not be surpris'd to find, that the inhabitants of the country are become quite enervated and degenerated from the dignity of their ancestors, and altogether lost in slothful servility and stupidity.

A little farther we came to Biscara, the capital of Zaab, where there is a Turkish garrison, who do duty in a small castle, erected a few years ago by the bey of Constantina, and the chief strength of it consists in six pieces of brass ordnance, and a few unweildy mortars, which are mounted upon carriages. All over this province, the footsteps of the Romans may be traced by broken inscriptions and mouldering monuments, that have partly escaped the fury of the Arabs; and some stone coffins have been dug up near the river of Benteafe. The inhabitants of Zaab are, to this day, fond of eating dog's flesh, for which the Carthaginians were

once remarkable; this was the reason why they were called Canurii. How these people should have been so fond of what all the Europeans look upon as carrion, we are at a loss to judge, but probably it was at first in consequence of a religious sentiment; for among the Heathen nations, meats and drinks always made an article of their religion. Unless this is allowed, we cannot admit any thing in history; but when it is once admitted, a thousand obstacles are cleared up, and a thousand difficulties removed.

Having thus taken a view of the kingdom of Algiers, and considered every thing in it worthy of notice, we shall proceed to lay before the reader what occurred to us in passing through the dominions of Tunis. Our design was to give an exact description of these countries, and to mention nothing as truths but what would bear the test of a public enquiry. This is the more necessary, because many romantic stories have been related by persons calling themselves travellers, whereas many of them were never out of their own countries.

We must here observe, that the natives of Algiers live extremely happy; for although the government is nominally despotic, yet it is not so in reality. The people, sensible of the duty they owe to the superior powers, seldom take up arms against the government; but when they are so bad as to do so, a general revolution takes place. It is, in fact, a military government; and the soldiers can at all times displace the sovereign, and place another in his room, whenever it appears to be consistent with their interest.

We entered the kingdom of Tunis, and traversed a large tract of ground before we met with any thing worth our notice. But before we proceed farther, it will be necessary that we describe the external boundaries of this place, which makes such a figure in modern history.

Tunis, according to the most accurate computation, is a little more than two hundred miles long, and about one hundred and seventy in breadth. It is bounded on the south by Tripoli, on the west by Algiers, on the east by the province of Shekah, and on the north it is washed by the Mediterranean Sea. It is not divided into provinces like Algiers, but into summer and winter circuits, because the bey assigns these seasons for his visiting the different parts of the country, in order to collect the tribute. In summer his journey is through the most fertile provinces that lie in the neighbourhood of Keff; and in winter he travels over Cairwan and Juraidic; and these two divisions, which we must keep in view, while we give an account of this kingdom, will be found to correspond with many things we meet with in the classic authors.

The summer circuit is much better inhabited than many parts of the neighbouring kingdoms, and has a greater number of towns and villages. The people are also more chearful, more kind, and more courteous to strangers, which can only be ascribed to the executive part of the government being better attended to here than it is in some other parts of the country. The whole of the country here is extremely fertile; but sometimes that fertility is interrupted by hills, rocks, and marshes, that will admit of no cultivation, nor any manner of improvement.

This part of the country is watered by the refreshing streams of the river Zaine, in which there is a small island called Ta-Barka, which at present is in possession of the Genoese, and for which they pay something annually to the regency; but the coral fishery, which was the chief object they had in view when they came to settle here having failed, it is very probable that self-interest will induce them to drop it as soon as they can have a convenient opportunity.

They have, however, built a good sort of fort, sufficient to protect them from the incursions of the lawless Arabs, as well from all other troublesome invaders. This place, however, is not at present in a flourishing condition, and, probably, the Genoese trade will fall to decay in consequence of the officiousness of their priests,

priests, in being so assiduous to make converts of the poor ignorant Mahometans to popery, although those very priests know, that the poor persons whom they convert, must suffer death, and that under the most excruciating tortures.

Having seen every thing worthy of notice in this place, we travelled about ten miles to the eastward, where we arrived at a French settlement, and were kindly received by the gentlemen of the factory. These gentlemen pay a considerable sum annually to the Turks for the privilege of trading here; but it must be acknowledged, that no men in the world can be more polite and obliging to strangers.

Upon a canal, between an extensive lake and the sea, lies the ancient city of Bizerta, being about a mile in circumference, and defended towards the sea by several batteries. The lake has a communication with the sea, into which it empties itself with a great force when the wind is high at the south. On the contrary, when the wind is northerly, the waters of the lake are driven back by the violence of the sea.

The channel of communication between the lake and the sea is the port of Hippo, which is still capable of receiving small vessels, and was not only one of the safest, but also one of the most beautiful havens on the coast. Here was a large pier, which ran out into the sea, and thereby destroyed the force of the north winds. However, the Turks, in consequence of their natural indolence, have let this place fall to decay; and thus a haven is destroyed, which in other hands would have been an inestimable treasure. This place abounds with fish, fruit, corn, oil, pulse, and various other productions.

From the gulph of Bizerta there is an extensive prospect of olive plantations, and very beautiful groves. It is bounded by a high ridge of rocks; and about two miles to the south are two small islands, without any houses upon them; and there the Italian galleys lie in wait, in order to make captures of some of the Tunisian corsairs.

Upon the side of a spacious navigable basin, formed by the river Merjerdah, lies Porto Ferino, where some years since there was a considerable city; but the place is at present only remarkable for its beautiful Cothon, which contains the navy of Tunis, and is safe from the weather. The Merjerdah waters run with a fine meandering stream through a rich fertile country, and, like the Nile, makes encroachments on the sea, by heaping sand and mud together in different places. This is the famous Bagrada of history, on the borders of which Regulus is said to have killed a monstrous serpent, which Pliny tells us was one hundred and twenty feet long.

It is certain that Utica, so much celebrated in the Roman history, lay somewhere in this neighbourhood; but at this distance of time it is in a manner impossible to fix upon its local situation. Indeed this is not much to be wondered at, when we consider what encroachments the sea has, from time to time, made upon the land: but this leads us to take some notice of the ruins of ancient Carthage. This celebrated city has undergone such a variety of revolutions, that to repeat them all would be to write a most voluminous history. The sea has swallowed up part of it in some places, and in others it has retired and left it, as it were, naked and forlorn. There are no triumphal arches, no pieces of curious architecture to be seen here, whereby one might be able to ascertain the identity of this famous city, which once stood up as a rival to Rome in greatness. It was built on three hills of an indifferent height, and had a variety of cisterns, which have escaped the general ruin, while few remains of the other public buildings are left. Near the greater cistern are the ruins of an ancient and celebrated aqueduct, which undoubtedly was a work of extraordinary labour, and beautifully finished with hewn stone.

Almost every house was furnished with a cistern for saving water, and of these there are still a vast number of remains. It would be difficult to determine

what supplies these cisterns afforded; but it is certain, that at Algiers, a city now furnished with the same conveniences as Carthage was formerly, the rain-water is seldom or never sufficient to supply the wants of the people; and in Carthage it must have been less so, when we consider that they were obliged to maintain a vast number of camels, horses, mules, and asses.

In vain did we look for the remains of public structures; they are all swallowed up in the deluge of time; and Carthaginian grandeur and Roman greatness, are both alike trampled upon by ignorant Barbarians. Of all the people recorded in history, none were more barbarous than the Carthaginians, for they sacrificed their own children, and crucified the princes whom they took in war. Nay, to such a height did they carry their notions in these cruel affairs, that if any of their generals happened to be in the least unsuccessful, he was instantly put to death. But every person who is in the least acquainted with history, knows these things, so that we shall not now insist on them.

Travelling about eight miles south-west of Carthage, we come to the channel of Guletta, that joins the lake of Tunis to the sea, and on each side it is guarded by a castle. The lake was formerly large enough to admit a numerous fleet of ships, but now in summer time the main channel of it is scarcely more than six or seven feet deep; and for the space of a mile or more within the banks, it is narrow and dry, being filled with what comes from the common sewer of Tunis.

In this lake are caught the largest and best mullets that are to be found on the coast of Barbary; and the roes of them, when steeped and pressed, are considered as a very great rarity. But the people are utterly ignorant of cookery, so that we were obliged to dress them ourselves, or be either poisoned or starved!

The next place we visited was Tunis, the capital of this kingdom, about three miles in circumference, but not so popular as Algiers; neither are the houses so spacious and magnificent. It is situated on the western banks of the lake, having Carthage full in view; and when viewed from the sea, it appears as if covered with chalky cliffs, which probably induced the historian, Diodorus Siculus, to call it the White City. The air is pure and extremely healthful, on account of the vast number of aromatic herbs that grow in the neighbourhood, and disperse their refreshing fragrance all over the place. Were it not for this, the air would be very unwholesome, on account of the vapours arising from the marshy grounds near it, which being in a manner stagnated a great part of the year, becomes noxious to those who do not take proper care of themselves, so as to prevent the influences of an infection. The water indeed is brackish, but if we except that, there are plenty of all sorts of provisions.

The Tunisians are the most civilized people who inhabit the coast of the Mediterranean; for, instead of plundering their neighbours, they addict themselves to trade and commerce, which induces them to cultivate the friendship of the Christians. This is, undoubtedly, much to their honour; for by living honestly, they acquire respect even by those who do not chuse to follow their example. Near Tunis is a famous monument of a Mahometan saint, called Seedy Dorde; but although one of the Mahometan saints might have been buried here, yet, upon enquiry and examination, we were fully convinced that it was a Roman work, constructed long before the name or religion of Mahomet was known. It consists of a fine mosaic pavement, wrought with great symmetry and proportion, and the figures are trees, houses, birds and fishes. The inland part is very fine, and the column so beautiful, that they may be put on a footing with tolerable good painting. These figures were, undoubtedly, designed as symbols, most of which pointed out something expressive of human actions; but to all these we are now in a manner utter strangers.

All around are the ruins of the ancient Nisa, where there was once a safe and commodious harbour for shipping. At a village, called Lowhareca, a little further

farther on are several ruins, but none of them have any thing remarkable. This village is situate about a mile from the sea, and betwixt it and the sea is a mountain hollowed with great art, from the level to the height of thirty feet, and supported by pillars and arches, of which some parts remain standing.

About a league to the northward is Cape Bon, called by the antients the promontory of Mercury; and from the top of this promontory, the hills of Timly may be fairly discovered in clear weather. All around here, the country is extremely fertile and beautiful. Nature displays herself in her gayest forms; rocks, woods, hills, rivers, and even the ocean, contribute towards heightening the scene, and the numerous remains of antiquity every where to be met with, convince us, that here the Roman grandeur was once known. It gives a sanction to historical records, and removes from our minds those gloomy marks of superstition which are too apt to becloud them, when not guided by reason.

We visited Jerado, an antient ruined city, on the declivity of a hill, about ten miles to the south-west, where there are still some remains of antiquity. Near to this place is a lofty mountain, from whence there is a most extensive prospect on every side; and all that space of ground that lies to the northward of the foot of this mountain, is called Africa. It is probable, that it was from this spot that the whole Continent first received its name, but in what age that happened, cannot now be certainly known; possibly about the time that Rome began to rise up into a state of grandeur, because it is mentioned under that name by the oldest of their poets or historians. Upon an old gate of Jerado, there is a carving of a ram's head, from whence we may infer, that there was formerly in this place a temple dedicated to Jupiter Ammon.

The next remarkable place we visited was Susa, a very considerable city, where the inhabitants carry on a great trade in oil and lemons. There are so many fragments of antiquity constantly to be found here, that there can remain no doubt but it was once a place of considerable repute, and much esteemed in antient times.

The whole neighbourhood of this place is finely watered, there being a vast number of streams in the adjacent parts, and this in a great measure contributes to promote the health of the inhabitants.

Travelling about five miles farther, we came to a pleasant village called Monasteer, bordering on the small cape, and not seeming to lay any claim to antiquity. It commands the bey of Lampta, which was probably the northern mound of the Cothon, great part of which still remains, in spite of the devastation of time, and the encroachments made by the ocean. It was built of mortar and pebbles, so firm as even to be equal to a solid rock.

The next place we visited was Medea, on the sea-coast, and since a place of some repute. The avenue of the port is an hundred yards square, and forms a key within the walls of the city, but is at present too shallow for vessels, except those of small burden. There are, however, some antiquities here, and nothing can so much tire the mind of a traveller, who knows any thing of antient history, as to know or discover that it was at this place Hamilcar made his son Hannibal swear, that he would never make peace with the Romans.

Near this place is Elalia, where there are many ruins, but they are in general so much defaced, that little can be made of them. Some of these ruins consist of cisterns; and, on viewing them, we are filled with some notions of the antient Roman grandeur. The Turks, however, who are sworn enemies to every thing in antiquity, have mutilated them in such a manner, that we lament the loss, while we are laughed at in making our enquiries. This town is situated in a fertile plain, extending a considerable way in length, and the ground around it, notwithstanding the indolence of the people, is finely cultivated. Near it is Cappadocia, a small tract of land, stretching a great way

into the sea; and upon the extreme of it is a high watch tower, surrounded with ruins, that probably belonged formerly to the city built here by the emperor Justinian. The whole of the coast adjoining to this place, is in general so dangerous for mariners, that no seamen, who know any thing of it, will venture into it, except in the most calm and favourable weather; but while they lay at anchor, they catch so many fish, that it makes them in a manner amends for all their trouble.

The next place we visited was Arfax, a pretty flourishing city, and the inhabitants are industrious, because they do not labour under the same scene of hardships as those in other parts of Barbary. The houses in this city are but meanly constructed, being mostly built of materials brought from a place at ten miles distance, namely, the antient city of Thena, much famed for its commerce, but now reduced to a heap of ruins. The whole country around here is extremely barren; for such is the indolence of the people, that they are in all respects strangers to industry. Near to this place is Ma-harefs, a small village, where there is an antient castle, and the remains of some cisterns, said to have been built by the Saracens, but it appears they are Roman works; for the Saracens despised all the remains of antiquity, and this is the reason why we cannot find in Turkey, or in any Mahometan country, those monuments which are so often mentioned in antient history.

Leaving the sea-coast, and taking an inland course, we anchored in a short time at Hadrah, which lies in a valley, and is watered by several pleasant rivulets. From the vast extent of its ruins, this place appears to have been once very considerable in this part of the country; for the foundations of several houses, with a great number of pavements and cisterns, are still to be seen; all which have the marks of antiquity.

Here are also a vast number of marble monuments, some of which are supported by four, and some by six pillars, and others are square, with a niche at the top. All the Greek and Roman inscriptions are defaced by the malice and ignorance of the Arabs, who never pay any regard to those precious relics of antiquity, than if they were the work of yesterday. Among other remains of antiquity, here is a triumphal arch, in memory of Severus Pertinax, but there is no inscription left upon it, to inform us by whom it was constructed.

The next place we visited was Kaer-wan, a populous city, and walled round. It is situated in a plain, and carries on a considerable trade. About a furlong without the walls, is a capacious cistern to receive rain-water; but on account of the heat in summer, it frequently dries up, or becomes stagnated, which creates agues and other disorders among the people. Here are some fine remains of architecture, and a mosque supported by five hundred granite pillars, said to be the most magnificent structure of that nature in Barbary, and by the devotees accounted the most sacred. All the inscriptions here are so much defaced, that no person can make any thing of them, so that we are left in ignorance concerning the antiquities of the city.

It is remarkable, that all along through Africa, the monuments and remains of antiquity, are more defaced than in any other parts of the world. The reason is plain, the Goths and Vandals made such devastations here, that nothing escaped their fury; and this happening about the decline of the Roman empire, towards the middle of the fifth century, every thing contributed to bring about a general devastation.

At Spaitla, the antient Suptula, among other mouldering ruins, there is a grand triumphal arch of the Corinthian order, consisting of one large arch and two smaller ones on each side, and from it, all the way to the city, there is a black stone pavement, guarded on each side by a parapet wall, for the more convenient passage of heroes who triumphed. At the end of the pavement, you pass through a spacious Corinthian portico, into a noble area, where there are three renowned temples, with many pediments and entablatures, together

ther with a vast number of other decorations. All these three buildings have, in some measure, escaped the ravages of time; and when we consider how often the country has changed its masters, we are rather surpris'd to find them in such a state of perfection.

Travelling more to the westward, we came to Truzza, where we saw several vaulted chambers, which were perpetually filled with sulphurous steams. These are much frequented by the Arabs, for the benefit of sweating, and they are of great service in the cure of many disorders. The river Meeguleel waters the neighbouring country; and the Arabs contrive to make it overflow many tracts of land, which are seldom or ever refreshed with rain. On the banks of this river, near Truzza, are the ruins of a large city, but there are no inscriptions to be met with; to inform us what was its name, or by whom it was built.

More to the south-west, on a precipice that hangs over the river Derb, there is a large arch of Attic structure, supported by Gothic pillars, and adorned with designs in the Corinthian fashion. It was built by Manlius Felix; and in the plain below there are many tombs, upon which are several Latin inscriptions, but they contain nothing remarkable. Here, and throughout the whole neighbourhood for several miles, are a great many villages, near each of which there are some plantations of oranges, which renders it extremely delightful and pleasant.

The next place we visited was Jemme, the same that Cæsar calls Trifstra, and although it is now in ruins, yet it abounds with a vast number of antiquities, such as pillars, altars, and a spacious amphitheatre; but in a late revolt of the Arabs, Mahomet Bey blew up four of the arches from top to bottom, because the rebels had turned it into a fort. From what still remains of it, nothing can give us a more exalted idea of Roman greatness. Part of the platform, and many of the seats are still remaining, and in the centre of the area there is a deep well hewn out of the solid rock, whence the pillar, that supported the awning, may probably have been fixed.

By comparing this with some others of a similar nature, it appears to have been built about the time of the Antonines, agreeing exactly in proportion and workmanship with the structures of that age; and as the elder Gordian was proclaimed emperor in this city, it is not improbable, that out of gratitude to the place where he received the diadem, he might have founded some public buildings. Upon one of the medals of the younger Gordian, there is the figure of a theatre; not hitherto accounted for by the medalists, and probably it may allude to this place.

Six miles more to the south-east, we visited Rugga, the ancient Carragu, where we saw the remains of a large cistern, that formerly supplied the whole city with water: this has been a very curious structure, and the pillars that supported the roof, are still standing. Fere-nah, which, from its lonely situation, is probably the Thala of the antients, is situated near Rugga, and was once the largest city of Bizacium, but at present all the remains of its grandeur consist in a few granite and other pillars, which by some extraordinary chance have escaped the devastation of the Arabs. It hath been extremely well watered, for besides the large brook that runs under the walls, there have been several wells within the city, each of them surrounded with a rail, and vaulted over with a cupola. This and a good air are the only benefits that can be urged in favour of its situation; for, excepting a small piece of well cultivated ground, the rest of the neighbourhood is poor and barren.

There are several frightful precipices to the westward, and beyond there is an extensive desert, almost parched up by the scorching heats of the sun. While we were in this province, we could not visit the curiosities; having to visit Gapa, the Capra of the antients, and formerly one of the best fortified cities of Jugurtha. It is built in a solitary situation, on a rising ground, in the midst of mountains, from whence there is an extensive prospect. All around are plantations of olives,

palm-trees, vines, and indeed most sorts of fruits. These plantations are refreshed by a stream, collected from two fountains, one of them in the centre of the city, and the other in the citadel. The former is still walled round, and discharges itself into a large basin, contrived for bathing. These two fountains uniting form a stream, which the inhabitants partition out among their plantations. There are many altars and granite pillars among the walls of the houses and the citadel, which, when in their proper places, must have been great ornaments to the city, but most of the inscriptions upon them are defaced.

Here we entered into what is with great propriety called the dry country, and the first place we arrived at was Eb Jereed, a large town, the houses in which are all built of mud; and the roofs supported by palm-trees. Interspersed among those houses, we frequently found pillars of granite marble, with Roman inscriptions upon them, which may serve to shew, that this place was once in more repute than it is now. The trade carried on at present by the inhabitants is in dates, which they exchange for wheat, barley, and linen, with other necessaries brought from the contiguous parts. The dates of Tozar are most esteemed, and they are exported to Ethiopia, where they are exchanged for black stones, two or three quintals being the common price given for one. The whole country around this place, is extremely beautiful, for although the sun beams are fierce, yet the cooling plantations make amends.

There are several villages here, divided by a Lake, and separated by palm-trees fixed at convenient distances, for the direction of caravans, and for this reason the road is called the Lake of Merks. Were it not for the guides, the quicksands would make the passage extremely difficult, it being from east to west twenty leagues, and in some places six leagues broad. In this lake are many small islands, one of which is covered with dates, and these, according to a tradition of the Arabs, spring from the stones of the fruit which an Egyptian army brought hither with them, and planted for the sake of nourishment.

From this place we travelled from El-Hammah, full thirty miles over an inhospitable desert, without either wood or water. This is a frontier town belonging to the bey of Tunis, and is very antient; for here is a castle and a garrison kept by the Turks. The houses in this town are in general poor miserable huts, thatched with straw, and have walls of mud; they are in general about twelve feet square, with banks running around them, for the convenience of those who come to bathe, which is frequent enough here.

In most of these towns and villages through which we passed, there is a house set apart for the reception of a traveller, with proper servants to attend him; and all this is done at the expence of the community. In Turkey there are many caravanseras, but here there are but three; so that unless a traveller can procure a lodging, he is obliged to pitch his tent in the open fields, and there he must remain till morning in great danger of being assaulted by the wild Arabs, who imagine that all those who have tents are persons of fortune, and consequently have great riches, of which they think to make a booty.

A few years before we visited this country, some gentlemen, who had come from Europe, found what is here represented reduced to practice. They were going to visit Abyssinia, and in the course of their travelling they were one night obliged to encamp; but before morning the Arabs came and murdered every one of them. Indeed this is frequent in the country; and therefore those who travel should take care when they pitch their tents, always to have some person in readiness to spread the alarm when any of the Arabs come up.

The journey through this part of the country was the most afflicting that can be imagined; in the day the heat was excessive, and it was equally cold at night, unless it happened that we could meet with some shades to shelter ourselves under from the inclemency

mency of the season. Indeed our camels were the greatest sufferers, although we took all the care of them we possibly could; for we gathered stubble, grass, and every thing else for them we could think of, before we had so much as considered whether we had any provisions left for ourselves. In the whole of this country we met with a large share of barbarity and dishonesty; and although we endeavoured to conduct ourselves with the utmost prudence, yet we frequently found it rather impracticable.

There is one rule to be observed in travelling through this country, and that is, to have always on a Turkish dress. This prevents them from being considered as singular, and consequently they often pass through the country unnoticed, or at least they are not considered as strangers. The people believe them to be Turks like themselves, and therefore they take little or no notice of them.

The Arabs seldom follow any sort of employment, but rove about from one place to another; without any

settled habitations. When no temptations to plunder lead them abroad, they remain at home in a state of indolence, reposing themselves under the shades of some of their trees. They have no relish for domestic pleasures, and they very seldom converse with their wives and children. Their greatest pleasure consists in roving abroad, and hunting wild fowl from one place to another. They esteem their horses as superior to every thing; and indeed this seems to have been the practice of the Turks from time immemorial.

Such is the account that Dr. Shaw has given of these people, and of their manners and customs; and when we consider every thing, we must be naturally led to acknowledge, that many of their practices are consistent with some things that we frequently find mentioned in the Old Testament. The abstract we have given is just and fair; and now we shall proceed to relate what some other travellers have seen of the interior parts of Africa.

TRAVELS THROUGH DIFFERENT PARTS OF AFRICA.

By Sir THOMAS HERBERT, Sir GEORGE SANDYS, Mr. MARMOL, and others.

THE characters of these gentlemen are so well established in the literary world, that nothing can be added to them. Sir George Sandys was son of Dr. Edwin Sandys, archbishop of York, who had suffered much for his religion; and this George, his son, was not only as good, but also well acquainted with every part of human learning. The other gentlemen were equally reputable, and therefore we shall proceed to mention every thing curious related by them.

We shall therefore begin with Marmol, who is one of the principal persons that had an opportunity of visiting the kingdom of Morocco.

We began our journey at Ilec, the most western province of Morocco, which is craggy and mountainous; and there we saw vast numbers of goats, horses, wild asses, and a variety of other animals, of which there are vast numbers here.

Great quantities of barley grow here, but we could neither find wheat nor oats, which is the rather remarkable, because the latter, for the most part, thrives best on barren ground. They have vast numbers of bee-hives, from which they gather great quantities of honey, so that much of their trade consists in exporting wax, which brings them in a considerable revenue. The natives are a warlike people, but brutish and uncivil to strangers. Their valleys being well watered with springs and rivers, might make good vineyard and gardens, but they neglect both; neither do they plant olive-trees, for what oil they use is made of the kernel of a certain fruit that grows upon a tree called erapen. The fruit is as large as a common apricot, and contains nothing but a stone, covered with skin, and, when ripe, shines transparently in the night. The goats feed upon it, but are not able to break the stone, so that the natives gather them, and extract the oil above-mentioned from them; but it has a most rank, disagreeable taste.

The inhabitants are so ignorant, that not one of them can read or write, except a few of their priests, whose example and precepts are a standing rule to all the people in the country; for although they all profess to be Mahometans, yet they know very little of the alcoran. They wear no shirts, because they have no linen but what is bought at some of the inland towns, and that is generally purchased by the people of quality. They have neither hats nor caps on their

heads, but only woollen rollers, about half a foot broad, which they roll five or six times about their heads, in the form of turbans. The finest of these fillets are of cotton cloth, striped with red, with tassels hanging down on each side.

The young men shave their heads and faces, but married men not only suffer their beards to grow, but also let a little tuft of hair grow on the crown of their heads; and this is the mark, they say, by which the Mahometans will be distinguished in the day of judgment. Those who live in cities and towns live more decently than the other; for they wear doublets of woollen cloth, with long skirts and woollen sleeves, and a great many buttons on the breast, with a cassock above all, rather finer than the rest. Their women have long and large shifts, and a sort of veil, which they call haygue, within doors; if they are ladies of quality, they cover themselves with half linen and half silk, which they fasten upon their breast with a silver buckle. Upon their arms they have silver bracelets, and large silver rings upon their ancles, besides several other rings of gold, silver, or iron, according to their ability. The gentry lie under a sort of tapestry, but the common people have nothing to lie on besides bullrushes or goat-skins, with which they cover themselves. The men are of a robust constitution, but very jealous of their wives, who are commonly handsome, and of a clean, white, and sanguine complexion.

Their ordinary food is barley-meal, which they either bake into cakes in an oven, or in an earthen pan, and eat it hot with butter, honey, or oil; or sometimes with goats flesh stewed. Sometimes they boil the meal with milk or fresh butter, and so eat it; but their xacida is a piece of paste, or dough, boiled with water and salt, having a hole in the middle filled with butter, or oil, in which they dip their bread when they eat it, and then they drink up the broth. When they eat, they sit down, both men and women, on the ground, and the earthen vessels being placed in the middle, they grasp at the victuals with their right hand, it being considered as dishonourable for them to make use of knives or spoons, or to touch it with the left hand, because with that member they wash themselves; and so nasty are they, that they never wipe their hands after they have been at an entertainment.

The whole of this province is extremely well peopled,

pled, being full of large villages; but the inhabitants are the most turbulent wretches in the world, for they live in continual war with each other. Their arms are three or four darts, with sharp steel points, and a poniard, bent like a sickle, which cuts in the inner side; and to these they add several slings, tied about their middle: luckily, however, they have acquired some knowledge of fire-arms; but their progress in military discipline has been very trifling.

In fighting they always betake themselves to steep and inaccessible places, from whence they tumble down stones upon their enemies; and upon an attack they make such a noise, that one would take them to be much more numerous than they are: and what we have here said of these people may with great propriety be applied to all the inhabitants of this kingdom or empire of Morocco.

Tednest, the next place we visited, is the capital of this province, and is watered by a fine river, that runs at only a few miles distance. All along the banks of this river are beautiful gardens, and delightful plantations, laid out in the most agreeable manner.

All the houses are built of wood, and most of them are covered with plaster. Most of the inhabitants of this country are shepherds and labouring men, who spend their time in the fields, and the rest are taylor, carpenters, and smiths; to which we may add some Jews that are goldsmiths, and some merchants that sell the broad-cloth made in the country, and trade in purchasing linen cloth imported from Susai, where the European merchants exchange it for wax and leather. This city has but very few conveniences, for there are no baths, inns, nor hospitals, except in Goree, for such poor people as pass that way. There are two hundred Jewish families residing in one quarter of this city, where they are allowed to observe their own law, for paying about ten shillings a year to the governor; but besides this, they are loaded with the most enormous taxes. Indeed this is not much to be wondered at, for these people have been oppressed in all ages, and in all nations, ever since their city and temple was destroyed by Titus. All mankind seem to join in treating them with contempt, and the miseries they have suffered are so great, that humanity shudders back at the bare recital of them, because they are a disgrace to human nature.

Tednest, though a place of considerable strength, has been destroyed several times; and it was once reduced so low, as to become a receptacle for wild beasts. But the adjacent country being fertile and populous, it was soon after rebuilt, and became famous for its commerce. From this time it became a place of great repute, and was considered as a royal city, but still it is much inferior to some others in Morocco. Xeriff Mahomet pitched upon it for the place of his residence, and adorned it with a fine palace and most elegant gardens, through which he contrived to have water conveyed. It was his place of arms against the Arabians, who infested his province, under the conduct of an African captain, who was a vassal of the king of Portugal.

This captain being a mortal enemy to the Moors, and a particular friend to the Portuguese, he marched against Mahomet, who was then at Tednest, accompanied by his two sons, with the flower of his army. Upon their arrival at the head of four hundred Arabian horse, and three thousand Moorish ones, with eight hundred Arabian foot, the Xeriff marched out of Tednest with four thousand horse, and meeting the vanguard, commanded by the African captain, was routed before the Portuguese general came up with the rear.

In this battle he lost eight hundred men, besides two hundred that were taken prisoners; and upon that he and his two sons betook themselves to flight. The victors having possessed themselves of a booty of three thousand head of cattle, small and great, besides a great many horses, camels, and mules, marched up to the city, and took it without the smallest opposition. After that it continued in the hands of the king of Por-

tugal, as well as many other places in this country, till the Xeriff having drawn together an army, recovered it, so that his posterity enjoy it to this day.

In the same neighbourhood we visited Agabel, a small fortified town, which was likewise taken by the above-mentioned general, who was the first that scaled the walls, and by his personal bravery not only animated his men, but astonished his enemies. This town was afterwards retaken by the Moors, and is now in their possession; for it has been its fortune always to fall into the hands of those who are masters of Tednest. At a small distance is Alguel, a very strong town, built on the top of a high mountain, and was once attacked by the Portuguese; but the Moors acted in such a courageous manner, that the assailants were obliged to retreat with disgrace.

About twelve miles farther along the coast, we arrived at Temleth, an ancient city, where there is a small harbour, with an old castle, built in such a manner as to have the command of the shipping. This town has undergone many revolutions, and it was once taken and destroyed by the Portuguese, but since that time it has been new peopled, and here we found the inhabitants extremely civil. The country adjacent is very fertile, and the mountains produce vast quantities of honey, which becomes a considerable article of commerce, the honey and wax being bought up by the European merchants.

But the principal strength of its neighbourhood consists in the dependence it has on the castle of Tesgdelt, where the governor resides, and where justice is at all times administered. Near to this is another castle, called Culchyat, built by one Omar, a Mahometan preacher, and it has always been of great service in keeping the people in a state of subjection. A little farther on a promontory, shooting out into the ocean, is a little town called Testone, with a pretty good harbour, where the European merchants used to land their goods. It was formerly called the port of Heriultus, and at present is a place of considerable strength, its walls and tower being built of brick and free-stone; and formerly a strong castle was kept here, the soldiers being supported from the duties that arose from the wax and honey exported to Europe, or to any other parts of the world. At present it is subject to the emperor of Morocco, and a governor resides in it, with a small garrison of soldiers. The inhabitants are in general civil to strangers, so that those who visit the country need not be under any apprehensions of danger from them. The bee-hives here are in a manner innumerable, for most of the country is covered with them. The honey and the wax are both such articles of commerce, that one would be surpris'd, why the people do not become rich in consequence of exporting the fruits of their labour. But then it must be considered, that these antient people are subjected to the payment of so many taxes, that they scarcely know what is their own. It is the duty of a sovereign to give his subjects any sort of indulgence to let them live in peace, and enjoy the fruits of their labour; but whenever the iron head of tyranny extends itself, so as to trample on the natural rights of mankind, than the people become dispirited, and sink down into a state of dejection.

The next place we visited in this extensive kingdom was Sus, which contains a vast number of districts. The western part of the country is a fine plain laying along the banks of the river Magerib, and the waters are conveyed to the neighbouring villages. The inhabitants are richer than those of many of the other provinces, for besides their large stocks of corn and cattle, they deal in sugars, having good mills for that purpose, ever since the Portuguese first invaded them. The variety of revolutions that have taken place in this country, are almost inconceivable, for it has been conquered and re-conquered many times. When the Xeriffs conquered it, the brother of the chief commander took possession, and gave it to his younger son, on condition of his paying homage, which he did for some time, till at last he drove his elder brother out, and made himself

master not only of all the province, but of several others in Numidia and Lybia. The country affords large quantities of indigo, allum, and several other articles which are extremely valuable in commerce, and these are sold once every year to the merchants residing at the sea-port towns, who send them to Europe.

In travelling through this province, we came to Zechieb, a small town, but famous on account of its vast number of sugar mills, first established here by a Jew, and which have since turned to a considerable advantage. The inhabitants of this town are extremely quarrelsome, and always falling out among themselves; but the government, in consequence of treating them with great severity, have at last made them obedient to the laws, and they are now good subjects. Here are vast numbers of Jews constantly residing, all of whom are merchants, and they carry on a considerable trade. There is something in this part of Africa, that, notwithstanding its being so much subject to be burnt up as it were by the scorching heat of the sun, yet appears delightful to a traveller; for nothing can possibly be more pleasing than to go from the sultry heat to the cooling shade.

Travelling still more to the eastward, we came to Jurudent, a city of considerable repute, where an extensive commerce is carried on. It is well fortified, and little inferior to some of the principal cities in Africa, there being large magazines in it, and here a governor constantly resides, whose authority extends all over the province.

Some are of opinion, that this town was founded by the Moors, but the whole of the architecture serves to point out the contrary; and there is the greatest reason to believe, that it was built by the antient Africans, long before the Mahometans came into this part of the world. We found the buildings in this town far superior to any we had hitherto seen in Africa. The streets were well paved, and the whole plentifully supplied with water. Here a court is held, where justice is administered; and considering every thing consistent with the nature of a despotic government, the place is as agreeable as could reasonably have been expected.

As this city lies near the foot of mount Atlas, so we find a few years ago another small town was built in its neighbourhood; and here is a commodious harbour, where ships may ride in safety. It was first erected by a Portuguese gentleman, who had established a fishery on this coast, and called it the House of a Christian, or rather the Christian's residence. From him it was purchased by the king of Portugal, who considered it as of great advantage to promote the trade of his subjects, but it has since been retaken by the Moors. A garrison of Moors is continually kept here, which serves to keep the wandering Arabs in a state of subjection, but still these wretches commit depredations on all they meet with. The Moors here are but little acquainted with military discipline; but then it must be remembered, that those who oppose them are equally ignorant with themselves. There are some circumstances relating to the history of this place, that might afford entertainment, but we shall not be too lavish in repeating them.

Muley Hamit, a powerful African prince, laid siege to this place, and continued before it no less than seven months; and after the loss of thirteen thousand men, took it upon the accidental blowing up of a barrel of gunpowder which was under a bulwark, and made a breach in the wall. At that time the Portuguese governor had a daughter, who was married to John de Carval, a man of the most unparalleled courage, who had signalized himself by killing thirty Moors with his own hand in one day, and fought upon his knees after he was wounded in both his legs, insomuch that the Moors were obliged to kill him at a distance with darts, for no body durst come near to touch him.

When the Moorish general saw the lady of the courageous hero, he was so taken with her beauty, that he instantly offered to take her into his seraglio; and upon her refusing to gratify his desires, he threatened

to make two of his slaves lie with her by force. In this extremity the lady consented to lay with the conqueror, upon condition he would marry her, and suffer her to continue a Christian. All this was complied with, and for some time hostilities ceased; but the Moors were so much dissatisfied, that her husband was obliged to seek to prevail on her to declare, that she had embraced Mahometanism. She being then big with child, complied with his request, and after her delivery, both she and her child were poisoned by the rest of his wives; but before her death, she declared, in the presence of her slaves, that she died a Christian; and had ever been such, but that she could not refuse to make a shew to the contrary, especially as her father was then in prison. This she desired them to make known to the world; and since her death, her husband sent her father, with some other Christian slaves, to Portugal.

The next province we visited was Morocco itself, which gives name to the whole kingdom, and is at present extremely populous. The inhabitants of this country, who live in towns and villages, are extremely cunning, and very knavish.

They are clothed decently enough in their way, and they have several regiments of horsemen disciplined according to the fashion of the country; but the inhabitants of the mountains near this place are little better than savages. Before we arrived at the metropolitan city, we visited the ruins of Agmet, once a place of great repute, but now fallen to decay. Here is a spacious lake, which receives a large collection of waters from the neighbouring streams, which descend plentifully from the mountains. It seems to have been the work of antient times; for it has every thing about it to point out that it is not natural. Here the country begins to put on an agreeable appearance; and such are the number of different sorts of fruit that offer themselves to our view, that we were noways surpris'd that the people have been reduced to such a state of womanish effeminacy.

Morocco, the capital city, from which the kingdom or empire derives its name, is the most beautiful and the most pleasantly situated in the whole extent of Africa. The streets are broad, and in some of the antient buildings we saw tables of alabaster, with inscriptions on them in Arabic letters, importing, that they were built by the tribe of Luntum, in the reign of Joseph Abu Techesiers, who, to carry on the work with the greater expedition, employed thirty thousand slaves in the building of it, and made it the place of his residence. It is surrounded with delicate walls, made of chalk and sand, mixed with a rich sort of earth, which renders the cement so hard, that when a pick-ax is struck upon it, it casts fire like a flint, and, considering the uncommon height of these walls, it is very remarkable that there is not so much as one breach in them, notwithstanding the city has been sacked and plundered.

The whole construction of this town shews the amazing skill of the architect, and is an object worthy of imitation by the most polite people in Europe. It has twenty-four gates, and at one time contained not less than one hundred thousand inhabitants. It is in a manner impossible, from its present state, to form a proper notion of its antient grandeur.

Here we saw a pillar of alabaster as high as a man, placed upon an antient tomb, with an inscription in Arabic, of which the following is a translation: "I was Ali the son of Aria, who commanded one hundred thousand men; possessed ten thousand horses, and in one day caused one hundred and one pits to be digged for watering them. I married two hundred girls, and was always faithful and victorious, being one of Jacob Almanfor's twenty-four generals. The fortieth year of my age put an end to my life; may whoever reads this epitaph, pray to God to pardon me."

From this epitaph, it appears that the historians have not exaggerated the grandeur of those Moorish or African princes, who have so often crossed the Me-

diterranean Sea, and established colonies in Spain. If one general in twenty-four had the command of one hundred thousand men, what an amazing army must the sovereign have had in the whole! For it is necessary to observe, that among these people, and throughout all antiquity, no generals had commissions unless they had at the same time a command.

The temple of Hali, or rather Ali, was built many centuries ago, and is indeed a magnificent structure. Jacob Almanzor having taken the city of Seville in Spain, he spoiled the great church of all its ornaments; and, not satisfied with that, took the pillars of the altar and portico along with him to adorn this temple. The spire of this temple has upon it four balls of gold, fastened upon an iron spike, the lowest and largest of which will hold eight bushels of corn, and the rest are in proportion. The body of these balls is of copper, but it is covered over with gold; and the African historians tell us, that Jacob Almanzor's women gave all their ear-rings and other jewels for this pious use. In this perhaps there may be some mistake; for when we consider what vast riches the Moors took out of Spain, we shall not be surpris'd to find them throwing them away in unnecessary decorations.

However, the vulgar people, who, like all other Mahometans, are very superstitious, believe that these globes were made by spirits in some remote part of the world, and brought hither in the same supernatural manner; and they believe that those spirits still wait to guard them from every sort of injury. When king Naur was attacked on all hands by the Arabians, the Portuguese, and the king of Fez, he would fain have taken them down, and paid his troops with them; but the inhabitants remonstrated, that rather than the honour of their city should be so far sunk, they and their children should be sold as slaves. However, Muley Hamet lately took down the uppermost ball, and sold the gold of it for twenty-five thousand pistoles; after which, to appease the people, he caused the copper body to be gilt and put up in its place; and hanged up in the most barbarous manner, upon the spire of the temple, the Jewish goldsmith who by his own order had purchased the gold. The people had such an opinion of the sanctity of the gold, that when the Jew was hanged up, they believed it was done by the interposition of the spirits who guarded the place.

Soon after this affair happened, the prince lost both his crown and his life, and the people imputed his misfortunes to this sacrilege, so that since that time no one has presumed to touch them.

There were formerly two large apartments in this city, which were set apart for those Christians called Mufarabians, whom the king of Morocco employed to serve him as soldiers; and there they were permitted to live with their wives and children in the free exercise of their religion. These Christians were called Mufarabians because they understood the Arabian language, and they were brought from Spain by Jacob Almanzor, as a guard for his person. Their number in general amounted to about five hundred horsemen, well mounted and well paid. They continued a long time in this service, till they were recalled by John I. king of Castile, who bestowed upon them many valuable privileges. The name of Mufarab is still perceived in seven popish churches in Toledo, where the Mufarabian service, and the Gothic ceremonies, do still take place.

In 1219 St. Belaid, a Spanish priest, and five others, went over to Morocco to preach the gospel, but the Moors put them to death for inveighing against the doctrines of Mahomet.

At that time Don Pedro, the king of Portugal's son, happening to be at Morocco, brought away the relics of these martyrs, and had them interred in the church of Coimbra. From that time the Mufarabian Christians had such respect with the Spanish princes, that they procured liberty to build a convent for Grey Friars in Morocco; but the Moors becoming triumphant, they were all put to death.

In the place where these Christians were murdered

there is now a large magazine for arms and gun-powder; but in 1569 a dreadful flash of lightning set fire to the whole, and it was blown up along with several of the neighbouring houses. Formerly the Jews had a particular spot allotted them for their residence in the neighbourhood of this city; but the late emperor ordered them to remove to a greater distance, that they might not lead the Moors over to their religion. The place of their present residence is walled round, having only one gate, that leads to their burying-ground. Most of these Jews, like their brethren in other parts of the world, are merchants or usurers; for except it be in a little of the jewellery or toy way, we never find that any of them are engaged in mechanical employments. Many of these Jews engage in the management of the public revenues; and every Jew pays an annual tax of a ducat for every person he maintains in his family.

In the middle of the city is a piece of ground raised higher than the streets, and this is the place where their criminals are executed. There are constantly a number of gibbets fixed, and criminals hanging upon them. Some of these wretches hang by the feet with their throats cut, and others are hung up by one arm, with their bellies ripped open. This is the way of punishing criminals when there is no prosecutor besides the civil magistrate; but when there is a private prosecutor, he must become the executioner himself, which he generally does either by smothering, or cutting his own throat. Sometimes they run him through the body with a spear; but any criminal may purchase his life if he has money.

One of the most remarkable things in this city is a lofty edifice, containing a general cistern for water, which may serve to shew, that these people, although now ranked among the number of infidels, yet were once not only well acquainted with the arts, but likewise had the means in their power to turn them to the most proper advantages.

This cistern receives no less than four hundred aqueducts, which lie very deep in the earth; and, according to the common tradition, they were constructed by twenty thousand Christian slaves. They add farther, that these waters come from Mount Atlas, which is at several leagues distance; but this is not true, for several men have from time to time been put into the aqueducts, with torches in their hands, in order to trace the source; but all of them pretended they could not get along, some for one obstacle, and some for another. However, the late emperor caused the ground to be digged for upwards of five leagues, and found that the waters did not come from such a distance, but that they were a collection of streams, gathered together not far from the city. This was done in such an artful manner, that supposing a foreign enemy should have come to besiege the city, it would not have been in their power to deprive the people of water. Some alterations have since that time taken place, and new aqueducts have been contrived to convey water from Mount Agmel to Morocco, which runs above fifty miles, and water all the plantations as they go along, and are an inestimable benefit to the people, who otherwise would be deprived of the necessaries of life.

The inhabitants of Morocco are a proud sort of people, and mortal enemies to the Christians. They wear cassocks of coloured cloth, embroidered down to the feet with small pieces, cut in the form of lozenges, over which they have vests of fine camblet, or silk and worsted stuff. They have shirts and drawers of white cloth, and scarlet caps, with white turbans. The women are very civil and airy, and their dress is either of silk or linen, reaching down to their knees. They wear no drawers as the women do in Fez, nor do they go on visits, except by permission of their husbands. They are permitted at all times to go to the mosques, or places of public worship, and on such occasion they are obliged to go to the baths, so that the restraint upon them is not so great as some Europeans are apt to imagine.

When

When they go to the basha, they have their faces so carefully veiled over, that no person can know who they are; which indeed seems rather an idle ceremony, because as there are none but persons of their own sex present, so consequently they may speak their sentiments to each other without reserve. It is certain, that the people here live in a very luxurious manner, and probably this is one of the reasons why they are such mean, cowardly, effeminate wretches.

It is almost impossible to express what store of provisions they have here, for besides dates, fruits, and all sorts of sweetmeats, they have an almost inexhaustible quantity of venison and wild fowl. The town is the most populous in all Africa, and the people, although not gentle in their manners to strangers, yet live very happy among themselves. This is, perhaps, one of the ends of government, and so far it ought to be approved of; for there are particular times and circumstances that require particular arrangements in the administering of public justice, and in the manner in which we should treat strangers.

Leaving Morocco, which is, perhaps, one of the most beautiful places in the universe, we came through groves and plantations to the province of Gesucela, where we found the inhabitants to be a wild barbarous crew of people. It is not enough to say that they are cruel to strangers, for they are continually quarreling with each other. They have here an annual fair, which commences on Mahomet's birth day, according to their traditional account, and continues two months. During this fair, they entertain above ten thousand foreign merchants, and observe a very regular order; although at other times they are the most brutish people in all Africa; but then it should be considered, that in this case self-interest becomes the predominant motive in their minds.

Most of the tradesmen here are coppersmiths or braisers, for it is but a few centuries ago since the Africans knew any thing of the nature of metals, so that these men are held in great estimation. The inhabitants of this province lived formerly without any regular form of government, but at present they are subject to the emperor, who being no stranger to the great service that arts must always be of to his country, not only grants them his protection, but likewise several privileges, some of which are superior to what the rest of his subjects can claim.

The next province we visited was Duguela, which is thirty leagues in length, and twenty-four in breadth. It is one of the first provinces in the empire, because it affords all the necessaries of life. Its plains are delightful, and the mountains very beautiful, from whence there are the most extensive prospects. In the plains we met with several wandering tribes of Arabs; but although they are by nature thieves, yet when a traveller presents them with a small present, they generally go away contented. Some of these Arabs have villages here; but they are of such a roving disposition, that they move from one place to another, and there is hardly a possibility of knowing where to find their fixed habitation, for indeed they have seldom any.

In this province we came to the city of Safia, called by the Africans, as well as by the Portuguese, Asaphia. Some are of opinion, that it is one of those cities which Hannibal, the great Carthaginian general, built in Lybia, by order of the senate; but of this we have no certain authority. At present the city has very good walls, but it is not fortified in a regular manner; for around it are several rising grounds, so that it may soon be taken by an enemy. In ancient times it belonged to the kings of Morocco, and at that time its trade was extensive, for the Spanish merchants imported cloth, linens, and other goods, in exchange for wax, indigo, gums, and other commodities. But civil wars breaking out in the province, some of the factious parties called in the Portuguese to their assistance, who were very ready to countenance such an opportunity, in order to establish their own grandeur. The whole of this province is extremely delightful,

whether we consider its abundance of woods, mountains, vallies, rivulets, or its beautiful villages. The people are numerous, which always points out, that whatever the spirit of government may be to foreigners, yet it is mild at home, for population will never go on where cruelty is exercised. But we shall have occasion to take some further notice of this country in the words of some gentlemen who have visited it later; and here we would beg the reader to suspend his judgment till he has put all these accounts together.

It is much to be lamented that the government of this kingdom is too despotic to admit of the people making any regular improvements either in the arts, or in such things as conduce towards promoting the happiness of the country. The climate, in some measure, makes the constitution and men become weak and pusillanimous, in consequence of their having forgotten or neglected to improve all their valuable qualities which should adorn them as rational beings. But this cannot be ascribed to the climate, for it is well known, from what remains we now have in this country, that the antient inhabitants of it were no strangers to those arts which adorn and polish human manners. On the contrary, they have left many monuments of their grandeur behind them; but this leads us to give some account of the kingdom of Fez, into which we entered after we left the territories of Morocco.

This kingdom is but little known to the Europeans, and yet several very learned gentlemen have left us various compositions of it. Among these we have that of Leeos, whose account we shall now follow, and the rather, because this gentleman visited it in antient times; and considering what has been written by all our modern travellers, we shall the more easily come to the truth, for analogy is the best way to resolve any problem or syllogism in logic.

We entered this kingdom by crossing the river Ommirabib, and the first place we visited was Temesne, situated in a plain country, and surrounded by many olive plantations. The buildings in the town have nothing in them remarkable, being mostly comprised of bricks dried in the sun, so that the rain washes great part of them away. All along here are a vast number of ruined castles, which may serve to shew, that whatever the people are at present here, yet in former times they were equally as warlike as those who lived in colder climates. In former times it contained no less than forty cities, and above three hundred castles; but most of these are now fallen to decay. About three hundred years ago, an apostate Mahometan stood up, and pretended that he was a real prophet. He persuaded the people to pay no taxes, and after a long war with the king of Fez, he had his title to the government and sovereignty of the province conferred by a treaty of peace. He continued in possession of these territories till Joseph, king of the tribe Lunhire, having built Meroao, sent several Mahometan doctors to persuade the people to pay homage. Upon that the people rose in a tumult, and slew the ambassadors, and the governor marched with fifty thousand men against Joseph; but Joseph in the mean time carried fire and sword into other parts of the province, and murdered all who came in his way, women and children not excepted, and he levelled the towns and castles to the ground. On the other hand, the governor of Fez fled with his fifty thousand men, but being obliged to run up steep mountains, most of them perished. The havock made among these people was so dreadful, that the whole place was in a manner depopulated; and Temesne, the capital, became, for some time, the habitation of wild beasts. At last king Manser, having returned from Tunis, gave the possession of it to some Arabians, whom he had brought along with him.

It is necessary to observe here, that the Roman arms penetrated into this part of Africa, for the city of Anfu, on the sea coast, was built by them. Here are still to be found several marks of Roman grandeur, such as baths, temples, ports, pillars, and arches.

The

The inhabitants are both civil to strangers, and also very industrious in attending to business of any sort whatever.

They wear a very decent apparel, and trade with the English and Portuguese. Adjoining to the city is a fine fertile plain, extending near one hundred miles in length, producing all the necessaries and comforts of life to the inhabitants, who seem to live here in a greater state of happiness than any others in Africa.

Here, while the place was subject to the Romans, were many learned men, and the place was adorned with temples, palaces, and all sorts of public buildings. There were shops and warehouses filled with such articles as the place affords, such as fruit and wines, which brought in a vast revenue.

From Anfu we travelled to Rebât, a small town, situated on a rock, and just where a large river empties itself into the sea. It was built by Munro, king of Morocco, while he was in possession of Granada, and a great part of Spain. It was designed as a frontier town, from whence he might be ready, at all times, to pour in forces upon the Christians. He adorned it with palaces, mosques, colleges, hospitals, baths, and built a strong tower without the walls on the south-side. This tower is the most stupendous building we ever saw, and from the top of it is an unbounded prospect. It is built in the Moorish taste, and the winding stairs are so broad, that three horses may go abreast together. Great encouragement was given to people to settle here, so that in a short time the town became extremely popular, particularly with all sorts of artists. A camp was every year formed in the neighbourhood; and because the water of the river is brackish, conduits were made to convey it from other parts.

But after Mauser's death, this noble water-work was demolished, and ever since the town has dwindled away in a most remarkable manner, so that at present there is not above a tenth part remaining of what was in former times. This king Mauser caused the city of Sella, which stands in the neighbourhood of this place to be walled round, and for the conveniency of his army, built in it a noble hospital, a stately palace, and a magnificent temple, within which was a small neat chapel, where he ordered by his will that his corpse should be interred: accordingly he was buried there, and not only his own relations, but also many of those kings who succeeded him, made choice of this place to have their remains deposited in.

From this place we travelled to Thagia, a small town, but famous for the birth-place of a Mahometan saint, who, according to their traditions, wrought a great number of miracles, and here this person lies buried. After the solemnization of Easter, the inhabitants of Fez make an annual visit to this tomb, although it is situated at the distance of no less than one hundred and twenty miles from that capital; but that is nothing, where the leading principle is superstition.

They perform this pilgrimage in fifteen days, carrying their tents and other necessaries along with them; and the pilgrims are so numerous, that one would take them for an army. There are few other places in this province that merit a particular description, but there are a vast number of villages scattered up and down the country, adorned with vineyards, which gives the whole a most beautiful appearance, without connecting any ideas of grandeur, utility, or beauty, than what will at all times take place in the human mind, where beholds honest industry.

The next province we visited was Fez, properly so called; and the first province we arrived at was Sella, the buildings of which make a stately shew and appearance, as considerable monuments of antiquity, being supported by grand marble pillars. The temples are very magnificent, and the shops towards the streets are built under large piazzas, to make a distinction between one trade and another. The adjacent country, though exceedingly sandy and barren, yet affords considerable quantities of cotton, and the inhabitants weave it into fine cloth. They have many other necessaries

of life in this province; but this leads us to say something concerning the capital.

Fez, so much celebrated in history, was founded about the latter end of the eighth century, and concerning of this city are many traditional accounts, none of which can be depended on; but we shall here select as many articles as we believe will be supported by rational evidence. Idris, the founder, was one of the immediate descendents of Mahomet, both by the father and mother: for after the death of Mahomet, when the war broke out between his descendents, one of the family of Ali, son-in-law of the impostor, continued at Ehnudina, and left behind him two sons, who growing into favour with the people, were thereupon persecuted, and one of them being taken and hanged, the other escaped to the mountains.

This Idris dwelt upon Mount Zaron, about thirty miles from Fez, and governed that country with the strictest justice, both in civil and religious matters. Dying without legitimate issue, he left one of the female slaves big with child, who had been converted from Christianity to Mahometanism. The young slave being delivered, the people named the child Idris, in memory of his father, and took great care of his education, according to the manner of their country; for they trained him up in all sorts of useful learning, till he arrived at years of maturity.

This young man having been early entered into the army, became a famous warrior before he was fifteen years of age; he added new conquests to his father's dominions, and formed the resolution of building a new city; and for that reason pitched upon the ground where Fez now stands, by reason of its plenty of springs, and the conveniency of an adjacent river and wood. Accordingly on the east bank of the river a town was built, containing three thousand families. After the death of this Idris his son built another town on the opposite banks of the river; but a war breaking out, Joseph king of Morocco was victorious, thirty thousand of the inhabitants were put to the sword, and both the towns united into one city.

Fez is built upon a great number of hills, some large and some small; but in the places around it are no curiosities whatever. The river enters the town by two branches, the one on the south, and the other on the west. It disperses itself into a variety of streams throughout every part of the city, and this water is conveyed to all the public buildings, which is attended with many advantages to the inhabitants of this country, especially when it is considered that health induces them to bathe, while at the same time they are constrained to it from motives of religion.

Most of the houses in this city are built of fine bricks and stones, curiously painted, and the portals are richly adorned. The inside of the roofs of their houses are ornamented with gold, azure, and some other colours, and the floors have carpets laid upon them. Some of the houses are two, and some are three stories high, and the chambers have on every side fine staircases. The doors of the chambers are high and wide, and the houses of the people of higher rank are for the most part beautifully adorned with carvings in wood. Each chamber has a closet in the wall, curiously painted; and indeed the insides of their houses are, in general, embellished in the most curious manner. Some of the houses have square cisterns before them, with cocks that convey the water into marble troughs. When the conduits are full, the overflowing water runs by certain pipes into these cisterns; and when the cisterns are full, it is carried off by other passages to the common sewer, and from thence to the river. These cisterns are always kept sweet and clean, and are never covered but in summer, at which time men, women, and children, bathe in them. Upon the tops of their houses they commonly have turrets, with pleasant rooms in them, which adds much to the beauty of the place.

The inhabitants of this city are almost innumerable, for here are no less than seven hundred Mahometan mosques, besides a vast number of baths. Many of these

these structures are stately; some of them are founded on the ruins of antient edifices, constructed by the Romans; and in general the whole of the constitution has so much utility, that it seems to point out that those who lived in what we call the middle ages, were not altogether fools. Every mosque has a steeple, where a man attends to call the people to prayers; and all those persons employed in this pious exercise are exempted from the payment of taxes. This, indeed, is all their wages; but those who call the people to prayers in the night have a certain salary allowed them. This is paid out of the treasures of the mosque; for they have always a door-keeper to attend, whose business it is to receive the oblations of the faithful, and to pay those persons who are employed in calling the people to church. The rest of the money is for the support of the priests, and to pay for the oil of the lamps that are constantly kept burning in these places of Mahometan worship, which we call mosques.

The chief Mahometan mosque is of such a magnitude, that the circumference, including the gardens and baths, exceeds a mile, and it has thirty-one high gates. The roof is one hundred and fifty cubits long, and eighty broad. The steeple, which is very high, is supported by twenty pillars in the breadth, and thirty in length. It has galleries on the east, west, and north sides, which are forty cubits long, and thirty broad; and under these galleries is the storehouse for oil, candles, mats, and other necessaries. Here are nine hundred lights kept burning every night, and some branches that have sockets for fifteen hundred candles, which are said to have been made of the bells which the Moors took from the Christians. In all their mosques are several pulpits, from which the Mahometan doctors deliver their discourses to the people, either relating to religion or moral philosophy. The winter lectures begin soon after sun-rise, and continue about an hour; and the summer ones continue from the going down of the sun till it is dark. All the lecturers have yearly salaries, and the chief priest of every mosque is to distribute corn, bread, and other necessaries to the poor. Here are a great number of officers belonging to the chief temple or mosque; and all these have their fixed salaries, each having a great number of persons to act under them; so that we find there are pluralists among the Mahometans as well as among the Christians.

The revenues of this mosque or temple amount to two hundred ducats every day; but part of that is laid out in charity, and to keep the temple in proper repair. Sometimes the king of Morocco, imagining the priests to be too rich, fleeces them of a little of their treasure, which is not at all to be wondered at, as the sovereigns of other nations do the same.

There are several stately colleges in this city, the walls of which are in general of marble, or free-stone, and the insides curiously carved and painted. One of them has an excellent marble fountain, with a large cistern, and a stream of water running through a court paved with marble. The doors of this college were of wood, and the gates of stone, curiously engraved. Adjoining to it are three walks, with square piazzas, overlaid with gold, azure, and several other ornaments; and on some of the pillars are verses, setting forth the merits of the founder. In the chapel is a pulpit, in which are no less than six or seven others; and these we ascended to by steps of white marble, overlaid with ivory and ebony. It is computed that this noble structure cost the king no less than forty-eight thousand ducats; but of this there can be no great certainty, because those who have visited this place since that time will contradict this account, as will be seen when we come to relate what has been written by Sir George Sandys.

Both the town and the suburbs have many noble hospitals, in which every stranger is entertained at the public expence. The revenues of these hospitals were very large till the war with Sabid, at which time the king sold the properties, alledging that he had a right to do so, because they were the gifts of his predecessors.

He promised indeed to make some reparation as soon as the war should be over; but he died before that good work was accomplished.

At present no strangers are entertained, but scholars and gentlemen, and it is only the poor decayed citizens that meet with any relief from the hospitals. There is one hospital indeed for such strangers as happen to be taken sick, where they have lodging, provisions, and women to attend them, but no medicines; and one apartment of this hospital is allotted for lunatics and madmen, where they are bound in strong iron chains, and severely lashed when they become unruly.

The next thing remarkable in this city is the baths, which are both pretty and magnificent, being all of one form, though not of equal bigness. Here are two baths, each of which has four halls; with galleries without, raised four or five stories higher, where the people strip themselves.

When any person bathes, he goes first through a cool hall, where the water is about lukewarm; then through a hotter room, where he is cleansed and washed; and at last is sent into a third hot-house, where he sweats as long as he pleases. The fire by which the water is heated is made only of the dung of beasts, parched in the sun. The womens baths are separate from those of the men, or if they both use the same baths, it is at different hours; for while the women are bathing, a rope is hung out at the outer door, signifying that no man must enter; and a husband is not permitted to see his wife in the bath; and when men enter, they cover their privy parts with a linen cloth.

After bathing, the men and women meet together and dance to several different sorts of music. These baths belong to the colleges, and the people who frequent them pay a small annual salary. The servants and other officers who attend these baths have a peculiar custom of marching on a certain day out of town, with trumpets and pipes, and there gather a wild onion, which they put into a brazen vessel, covered with a linen cloth dipped in ley, and so carry it into the hot-house, where they hang up the vessel over the door, as a lucky omen to the bath.

This city contains about two hundred inns, the greatest of which are near the chief mosque. Each of these inns is three stories high, and consists of upwards of one hundred chambers, each of which has a gallery. Every inn is accommodated with a fountain, water-pipes, and sinks to carry off the filth; but notwithstanding all these conveniences, and some others that might be mentioned, the entertainment that strangers receive is but very indifferent. They have no beds, unless it be a coarse blanket and a mat; nor have they any victuals, unless they go to the market and buy them.

The office of chamberlain and cook is performed by the widows of poor citizens, who are taken in there from motives of charity. The inn-keepers are all of one family, called Elehera. They shave their beards, and not only wear the habit of women, but imitate them in their speech and actions. Every one of these has a concubine, whom he entertains as a lawful wife, and these concubines are most notoriously lewd; nay, there are few besides lewd persons who frequent these inns, or keep company with the inn-keepers, for the places themselves are considered by the natives in the same light as we do bawdy-houses.

There are several thousands of mills in this city, all belonging to the churches and colleges, and each of them is placed in the center of the most public streets, fixed on a strong post. Each different trade has a particular place set apart for it, and most of these are, from motives of religion, placed near the grand mosque. There are a few merchant factors; and next to them is the herb-market, where most of the taverns are, because people love to drink wine under the green and shady boughs. And here, lest the reader should be surpris'd when we mention the Mahometans drinking wine, it is necessary to observe, that all the inn-keepers

keepers in this city, and all those who frequent them, are the most abandoned creatures imaginable, none of them being permitted to go into any of the mosques.

After them come the milk-sellers, who dispose of twenty-five tons of that article every day. The cotton-sellers are next to them, and then are those who sell hemp and ropes. Next to these resides the society of porters, a corporation so loving and affectionate, that they make provisions for the widows and fatherless belonging to their own corporation. They have a president or governor, who directs them, procures their wages, and at the end of the week makes an equal distribution of it among them.

Near this is a large square house, covered with reeds, where five hundred sacks of peas and turnips are sold in a day. The citizens are not permitted to buy these from the country people, for there are officers appointed for that purpose, who buy up the necessaries of life, and then impose a tax upon them, for which they account with government.

On the left side of the great mosque, is a place where they sell fritters and cakes fried in oil, and therefore the place is called, "The place of smoke." At the same place they sell roasted flesh, fried fish, and a sort of bread baked with honey. The flesh is not roasted on a spit, but in an oven, with another oven underneath it, in which the fire lies, so that the upper oven is free from smoke and excessive heat. They sell of their oiled cakes as many on a day as brings in above two hundred ducats.

Next to this market, or by whatever name it may be called, are the shambles, where all sorts of butchers meat are sold by weight. They kill no beasts within the shambles, there being a place for that purpose near the river. When a beast is killed, there is an officer, called master of the shambles, who examines it, and fixes a certain price upon every joint.

This price set upon the meat is written on a slip of paper, and the butcher is obliged to shew it, that the purchaser may know he is not imposed on.

In the next street to this is a great market for coarse cloth, there being no less than sixty men employed in signifying to the people what the price of each piece is, as it has been adjusted at the custom-house. Next to this place are the cage-makers, who make coops and cages for poultry, of a certain hard reed; for every citizen brings up a great many hens and capons, which are always penned up in coops, to prevent them from soiling their houses. Next to them is the market for thread and linen cloths; and on the west side of the mosque are a vast number of taylors shops, with those of laundresses, spur-makers, pipe-makers, &c. Beyond these there stands a mount or rock, with a walk leading to one of the king's palaces, where most of his sisters and other female relations reside.

The next place of note here is the exchange, so very large, that it is almost equal to a city, for it is walled round, and has twelve gates, with an iron chain before every one of them, to keep out horses and carts. It is divided into several parts or wards, two of which are allotted to such shoemakers as serve the greater sort of people with the different articles of their trade; and two to the silk-mercers and haberdashers of small wares. The other parts are taken up by those who sell European linen or woollen cloth, silks, stuffs, caps, mats, cushions, smocks, and such other things as are used in the dress of women. On the north side of the exchange is a place appropriated for the grocers and apothecaries, fortified on both sides with two strong gates, and guarded, during the night time, by watchmen with lanterns, well armed, and guarded by mastiffs. The apothecaries can make neither syrups nor electuaries, these being made and sold by the physicians, whose houses, for the most part, join to those of the apothecaries; but few people pay much regard either to the physician or his medicines.

Adjoining to this place are all the shops for turnery, cutlery, and other hardware goods, together with the

upholsterers, and several others. Here likewise are sold vast numbers of cork slippers, for the great merit to walk abroad in, when the weather is rainy. These slippers have very fine upper leathers, and being trimmed with silk, some of them cost five ducats a pair. Their finest slippers are made of the black and white mulberry-tree, and the black walnut-tree; but those made of cork last much longer than any others.

Adjoining to these are ten shops belonging to Spaniards, who make cross-bows; and others, who make brooms of a certain wild palm-tree, which are carried about the streets, and exchanged for bran, ashes, and old shoes. The bran is sold again to shepherds, the ashes to bleachers of thread, and the old shoes to the cobblers. The next to these are the smiths and coopers, who make and sell large vessels in the form of buckets; and corn measures. The corn measures must be tried and approved by an officer appointed for the purpose, who receives a farthing apiece as his fee.

The dyers live by the side of the river, and have each of them a clear fountain, or cistern, to wash their silks and stuffs in. The makers of warlike instruments live on the other side of the river, opposite to the dyers, in a very large place, which being planted with shady mulberry-trees, is extremely pleasant in summer. Next to them are the farriers, then the smiths in other branches, and, lastly, those who black linen. And here ends the west part of the city, which in former times was a city of itself, separated from the other on the eastern bank of the river.

The eastern part of Fez is beautified with marble palaces, mosques, colleges and houses; but it has neither so many shops nor merchants in it as there are in the western part.

Some of these indeed it has, but they are despised over many parts of the city, and they are, in general, very mean, in comparison of those already mentioned. Here is a corn market, with several granaries for corn, and about six hundred houses for weavers, handsomely built, and which pay considerable rents. It is reckoned that there are in this part of the city not less than twenty thousand weavers, and as many millers, with a great many houses for the sawing of wood, in which service the Christian captives are employed; but what wages they earn are the property of their merciless owners.

These Christian slaves have no days of rest but Fridays, and eight other days in the year, on which the Mahometans celebrate festivals. In this eastern part of the city are several public bawdy-houses, which the great men, and sometimes the governors of the city, countenance; and there are likewise several taverns, where women are kept for the use of those who may occasionally want them. Here are no less than six hundred fountains, all walled round, and carefully kept up, the water of each being conveyed by pipes to the mosques, baths, colleges, houses, and all other places where that refreshing element is wanted, or can be of any service.

This fountain water is preferable to that of the river, for oftentimes in summer the river cisterns are dry; and when the conduits are cleaned, the river water must of necessity be dispensed of. In summer the fountain waters are more cool than those of the rivers; but in spring, they are not so wholesome. Most of these fountains have their source from the west or south, for the northern parts of this province are full of rocks and mountains; and there are vast numbers of caves and cells, which probably were cut out of the rocks in antient times, to secure the poor oppressed inhabitants from the rigor of tyrants.

As for the south part of Fez, it is not half inhabited, but its gardens abound with fruits and flowers of all sorts; and the better sort of people generally live here from April to September; for every house has a fine delightful garden adjoining to it, and a crystal fountain, adorned with roses and all sorts of odoriferous flowers.

Westward, that is, towards the king's palace, there stands a noble castle, built by one of their antient kings,

Engraved for Moore's
Voyages & Travels

The KING of CONGO

Surrounded by his Attendants, giving Audience.

kings, and where the royal family formerly kept their court; but now it is the residence of the governor of the city, who acts much in the same manner as the bashas do in the Turkish and other eastern dominions.

In this castle there is a large prison for captives, and the structure is supported by a vast number of pillars, which rather disfigure than ornament the place. This prison is so large, that in one room are sometimes confined no less than three thousand men; and the worst thing is, there is no distinction made between the most notoriously guilty and those who are taken upon the slightest suspicion.

We shall now proceed to give some account of the internal government of this city, especially as it will be found, in its civil policy, to exceed many of the others in Africa. The governor of the city is judge both in civil and criminal matters, and pronounces sentence by word of mouth, for he has no clerk. Besides him, there is a judge of the canon law, who decides in all things relating to the religion of Mahomet. A third judge sits, and decides on all causes relating to marriage, divorce, scandal, and bestiality; and from what they determine, no appeal lies. In causes of adultery, it is common to punish the delinquent by giving him two or three hundred strokes with a small cane, on the soles of the feet. The criminal has then an iron chain, of a most enormous weight, put round his neck, and is led naked through all the streets of the city, from midnight till two o'clock in the morning, and a serjeant follows the criminal, proclaiming his guilt aloud to the people. This being done, they put on his cloaths, and bring him back to prison; and sometimes it happens, that several offenders are led through the city together. For every criminal, the governor receives a particular stated duty upon his first imprisonment, and one ducat and a half upon his condemnation; so that justice here is bought and sold.

Besides these forfeitures, he has several other perquisites, and a particular estate, which yields him seven hundred ducats annually; but for this he is obliged to maintain three hundred horsemen for the king whenever the monarch thinks proper to order it. The barristers, who plead in any cases relating to the laws of Mahomet, are prohibited from taking fees, but must plead the causes of their clients gratis. In general, most of their advocates know nothing at all concerning law, but they have to do with clients more ignorant than themselves. As for those who act under them as common officers, they have no other salary than those small perquisites which the prisoner is obliged to pay, in consequence of his having been obliged to submit to an ignominious punishment.

The customs and taxes of the city are collected only by one man, who pays the king thirty ducats a day, and has his subsistence. He has likewise substitutes to watch at every gate, and sometimes to go out and meet the carriages, so that nothing can pass without paying the customs. If any thing is found concealed, the offender pays double, but exemptions are granted in some particular cases. The same governor of the shambles, whom we have already mentioned, is the collector of these customs, and his salary depends on his assiduity in the discharge of his duty. If a baker is found to have his bread deficient in weight, he receives a hearty drubbing, and is led in contempt up and down the city.

The citizens of Fez wear a decent habit, having over their shirts narrow half-sleeved jackets, and over these a wide garment close before, which, in the spring, is generally made of such cloth as is imported from foreign parts. Upon their heads they have their caps, which do not cover their ears. These caps are covered with a scarf, which is twice wreathed about, and then hangs down in a knot. They wear neither stockings nor breeches; but when they ride a journey in the spring, they wear boots. The doctors and antient gentlemen wear a garment with wide sleeves, much in the same manner as is worn by the great dons of Venice.

The common people are, for the most part, clothed in white coarse garments; and in summer, the women wear nothing but smocks; but in the winter, they have a wide garment like the men. When they go abroad, they put on long breeches that cover their legs, and have a veil hanging down from their heads, that covers the whole fore-part of their bodies. Their faces are masked, their ears adorned with jewels, and their arms and legs with bracelets and rings of gold and silver according to their quality.

As for their diet, the gentlemen have fresh meat every day, and the common people twice a week. They breakfast on fruit, or a sort of flummery, like hasty-pudding; and in the winter upon the broth of salt meat. In summer they dine on melons, grapes, and milk; and in winter upon boiled meat and fallads, and such other things as the season will afford. And here it is necessary to observe, that their food is, in all respects, consistent with the nature of the climate in which they live; for, were they not to eat a great deal of fruits instead of flesh meat, their constitutions would become in all respects the most enervated that can be imagined.

When they eat, they sit on the ground, at a low, uncovered, nasty table, and use neither knives nor spoons, for they take the victuals out of the dish with their hands. They tear and devour the victuals like hungry dogs; and they seldom drink till they have gorged themselves full, and then they drink to excess. With respect to those men whom they call doctors, and whom they look upon as persons of learning, they are a little more orderly when they attend public entertainments, but in some respects not much; for ferocity of manners, in any country, generally diffuses itself among all ranks of people.

In the article of marriage, the bride and bridegroom, accompanied with their relations and friends, and two notaries, go to the mosque together, where every thing is settled before all those who are present; then the bridegroom entertains all the guests with fruits, fried mutton, cakes fried in oil, and a great many other things, agreeable to the custom of the country. After that the father of the bride makes nearly such another entertainment; and this practice has been of great antiquity in many heathen nations.

There is no fixed rule with respect to marriage fortunes, for every father gives his daughter according to the nature of his circumstances, and this is all that in natural equity can be desired. Men in ordinary circumstances generally give their daughters thirty ducats, with a few other trifles; but in this case there is no rule to govern it. Indeed, there is such a variety of particulars relating to the marriage ceremonies of these people, that they are not worth mentioning; for times and customs change in consequence of a variety of circumstances, and there is hardly a rule for the regulating of any one.

When the bridegroom is ready to carry home his bride, they put her into a large wooden cage, covered with silk, in which she is carried by porters; the bride's relations following after her with drums and trumpets. Having thus made a procession through the marketplace, and passing near the mosque, the bridegroom goes away home. Upon the bride's arrival, her relations conduct her to the bridegroom's chamber-door, where they deliver her to his mother. The bridegroom touches her foot with his, whereby she consecrates the room, and thus the ceremony ends.

In the mean time, a woman stands at the chamber-door till the marriage has been consummated; and some other ceremonies are observed, but as they border on indecency, we shall not mention them. As soon as the new married man goes abroad, which is generally on the seventh day after the marriage, he buys a great many fishes, which his mother, or some other woman, superstitiously casts on his wife's feet.

The next morning after the bride goes home, a company of women come and dress the bride, and paint her cheeks and her feet with a black dye: then another feast ensues; the bride being seated on a high place,

place, in view of all the company. The preceding night is spent in dancing, the women dancing alone, and all of them one by one. At the end of each dance, they reward the musicians; and if any one means to honour the dancer, he bids him kneel down, and fastens pieces of money all over his face, which the musicians take off for their reward. At the same time there are ministers and singers, who entertain the company, sometimes with instrumental, and sometimes with vocal music; but if the bride be a widow, the solemnity is not near so great.

They make solemn feasts at the circumcision of their children, which is on the seventh day after birth; and upon that occasion, every one gives something to the person who performs the ceremony. The people of this country observe a great many ceremonies, nearly the same as the Roman Catholics on their festivals, but they can give no account of their origin.

When the Goths and Vandals invaded Africa, they found many Christians there, although the religion itself was on the decline. These barbarians embraced what was then called Christianity, and their descendants kept possession of the country, till driven out or subdued by the Mahometans. This will in some measure account for their keeping the Christian festivals, and observing a great number of other ceremonies.

When the husband, brother, or any of the male relations dies, a company of women, related to the deceased, put on sackcloth, and cover their faces with ashes; then having called some men, dressed in women's apparel, with some square drums, they sing at the noise of these a funeral song in praise of the deceased, making a hideous noise at the end of every verse, tearing their hair, and beating their cheeks and breasts till they are covered with blood.

This superstition, which prevails more among the common people than the gentry, continues seven days together, at the end of which they refrain from mourning, and continue to do so forty days together. In the mean time the widow's friends come to comfort her, and send her several dishes of meat, for they dress no meat in the mourning house till the corpse is carried off.

In this city are upwards of two hundred schools, like great halls, for the instruction of children, where they are taught not only to read and write, but also tables of geometry; and before they leave school, they must read over the whole of the Alcoran; nay, some are obliged to get it by heart, especially such as are designed for public employments. The reason is, they have no knowledge of printing, and written copies are hard to purchase; so that unless they were to treasure up some verses in their memory, they would forget all the principles of their religion.

The chief suburbs are to the west, consisting of about five hundred families of poor tradesmen, day labourers, water-bearers, mountebanks, and whores. In this place are near two hundred caves or cellars of fine marble, where the noblemen of Fez used to lay up their corn, for the least of these will contain one thousand bushels of wheat; but now they are empty, and walls are built before them, to prevent people from falling into them. This suburb is a receptacle for all the offscouring of the people, for here they keep common bawdy-houses, and sell wine, although contrary to the laws of Mahomet.

There is another suburb separate from this, where all those who are afflicted with the leprosy live, there being seldom less than two or three hundred of those persons. They have a governor over them, and he is obliged, by his office, to take care that none of these lepers go out of the bounds set apart for them. The children of a leper enjoys his father's estate after his death; but if the leper has no children, then his estate is divided, one part to the governor, and the other into a common stock, for the support of the lepers who have none of their own.

There are likewise without the city, several fields appropriated by some noblemen for the burials of the

dead. The common graves have a triangular stone upon them, but those of a higher rank have one stone at the head, and another at the feet, with inscriptions upon them. On the north-side of the city is a hill, on which are several tombs of their kings, finely cut in white marble; and considering the genius of the people, they are even more majestic than many in Europe.

New Fez is situated very near Old Fez, and was built by king Sanob for the accommodation of his court. It was divided by the king into three parts; one contained his own palace, and the noblemen's houses, to every one of which he allowed a spacious garden; and not far from his palace, he built a stately and sumptuous mosque. In another part of the city, he built a large and fine stable, or royal mews for the horses belonging to the court; and appointed a market-place, extending from the west to the east gate, which is a full mile in length, and there are shops on each side.

The third part is now the apartment of the Jews, for most of the goldsmiths and jewellers in that part are Jews, who carry their plate to Old Fez, and there dispose of it at a higher rate than they could at home. These Jews dwelt once in Old Fez, but the Moors having robbed them, king Abufabid ordered them to remove to New Fez, and possess a long street in that city. They have many fine shops and synagogues, their numbers being greatly multiplied since they were driven out of Spain.

The street where they now live, was the place allotted for the king's guard in former times, but now the kings have no guards. These Jews are treated in a very cruel manner. Every one despises them, and they are not permitted to wear either shoes or stockings, but only a sort of socks made of rushes. They wear black turbans on their heads; or if they wear caps, they must have a piece of red cloth tied to it. They pay a duty of four hundred ducats a month, besides a great number of other taxes.

Without the walls, the river water is raised by huge wheels and engines, invented by a Spaniard, which turn round but once in twenty-four hours. By this means it is carried over the walls into cisterns, from whence it is conveyed in pipes to the mosques, palaces, and gardens. Before these engines were erected, the water was conveyed from a fountain upwards of ten miles from the city, by means of a conduit, invented by a Genoese, who was a great favourite of the king.

Having said thus much concerning the city of Fez, we shall now take some notice of the nature of the government, of the kings, their laws, ordinances, and manner of executing them, because these particulars have been but little attended to by the Europeans.

The court is kept in New Fez, and is much more splendid than some of ours in Europe; for the king has a vast number of attendants, both of horse and foot, and in his seraglio are kept above five hundred women, though he only visits a few of them.

The people in this part of Africa have no notion of hereditary succession, being lodged in the particular family of one prince. The succession, indeed, continues sometimes regular for a few years, but it frequently meets with interruptions; for the people are of such a turbulent disposition, that they very often depose one king, and then elect another in his room.

As soon as the new king is proclaimed, he singles out one of his young men at court to be his chief counsellor, who acts the part of prime minister. This practice of having a favourite at court, to conduct the king's affairs, is not confined to Turkey, although it may operate with greater strength among an indolent people, than among those who live in more northerly climates. The truth is, all princes have their favourites, although many of them will not confess it. Nor is it much to be wondered at, for the two following reasons: First, all masters whatever have a right to place more confidence in one servant than in another, if, in his opinion, his merits intitle him to it. Secondly, it is done by princes, to take off the

greatest part of the weight of government from themselves, by having it executed by a deputy.

Under the favourite is another officer, who acts as secretary of state, and steward of the household; and next to him is the captain or master of the horse, and this officer has a deputy, who goes into the fields with the horses, to see that they are properly fed and attended. In the last place he nominates a new governor of the city; and as soon as his government is settled, he sends governors into the mountainous parts of the country, to govern the wild tribes of Arabs who are subject to his government. These officers collect the revenues, and allot different habitations to the Arabs, in order that they may live peaceably under government, without injuring one another.

There is no standing army kept here, except in time of war, and then they consist mostly of horsemen. These receive but very little pay, but they have corn, butter, and other provisions allowed them. All their horses are supported at the king's expence, and the men have a suit of cloaths allowed them once every year. Those who look after the horses are Christian slaves, who have had the misfortune to be taken captive; and although these poor creatures are obliged to labour very hard, yet, to add to their misery, they are loaded with iron chains, and when the army marches they are carried on the backs of camels.

The camels are taken care of by an officer appointed for that purpose, who disposes of the portions as he pleases, and takes care of the king's baggage that is carried on their backs. Another officer is the purveyor, who provides and distributes corn to the king's household and his army. In time of war, he has ten or twelve tents to lay up corn in, and sends every day camels to bring loads of fresh provisions. There is likewise a deputy officer, whose business it is to take care that the corn is kept in proper order; that none of it be embezzled, nor any of it eaten by the rats. He is accountable to the high steward for his conduct, and must give an exact account of every thing committed to his care.

The officer who executes the decrees of the king's court has great power, and is attended by fifty horsemen. He is to see that every criminal is punished; and he can even imprison the judges, if they refuse to do justice. There is a chancellor, who writes all the king's letters, and puts the royal seal to all public dispatches. Among the other officers are the following. A governor of the king's footmen, who always attends him, and gives directions to the servants how to act. A commissary for the baggage of the army, who takes care to carry the tents of the light-horsemen upon mules, and the tents of the other soldiers upon camels. A master of the ceremonies, who sits at the king's feet in the senate-house, and commands each member to speak according to his rank and dignity. To these we may add a company of standard-bearers, who upon their march carry their colours wrapped up, only that he who goes before the army has his banner displayed. Every one of this company is particularly well acquainted with the fords of rivers, and the passages through woods, for which reason they are for the most part the guides of the army.

There are a great many drummers in the army, who beat with a bull's pizzle upon drums of brass as big as a great kettle, the lower part of which is narrow, and the upper broad, being covered with a skin. These drummers ride on horseback, having always a great weight on the one side to counterpoise the weight of the drum on the other. Their horses are swift, and their drums make a most hideous noise, so as to inspire the men with martial courage. The musicians that attend the army are not paid by the king, for the different cities and towns are obliged to send a certain number of them to the wars, who are treated in such a manner as their behaviour intitles them to. All the women servants in the king's household are negro slaves; but the queen is always a white, which shews the respect paid to that colour.

There are some Spanish and Portuguese women

slaves kept about the court, and these are under the government of eunuchs, who are negroes, that watch them very narrowly.

The dominions of the king were once very extensive, and yet his revenue does not amount to more than three hundred thousand ducats annually, the fifth part of which does not come to himself. Most of the taxes are paid in butter, corn, cattle, oil, and a variety of other necessaries; but these fetch only a little money. The taxes are not regularly fixed, for in some of the provinces one family pays as much as ten do in another; and in the city of Fez the people are so much oppressed with the enormous load of taxes, that they complain more than those in the exterior provinces.

By the law of Mahomet the taxes were fixed, but the secular princes of that religion seldom pay much regard to the alcoran, for they are continually increasing their demands upon their people, so that the poor inhabitants seldom know how to procure themselves the necessaries of life. This is the reason why they abhor the courtiers, for, like some of the subjects in European nations, they consider all members of state as robbers of the public.

In time of peace the king maintains six thousand horse, five hundred cross-bowmen, and as many musqueteers, who encamp within a mile of his person, when he goes on a progress; but at Fez he keeps no other guard besides his common officers and domestics, and a few upper servants. When he declares war against the Arabians, he obliges all those Arabs who live under his protection to furnish him with an army of foot at their own expence; and these men are in general better soldiers than his own. There is but little pomp or ceremony about his person, neither does he desire it, except upon some public festivals.

When the king is to ride out, the master of the ceremonies gives notice to all the great officers of state, and they are ready to attend him at the gate of the palace; and when the king comes out of the gate, the attendants are marshalled in the following manner. The standard-bearer goes first, then the drummers, then the chief groom of the stable, with his attendants; then comes the king's guards, grenadiers, his treasurer, his chief judge, his captain general, and three officers, each carrying something as marks of their dignity; and the whole is closed by the king himself, who comes out dressed, guarded, and attended in person by his more immediate domestics.

When the king encamps with his army, his own grand tent, which is fifty ells square, is first pitched; and this royal pavilion has four gates, guarded by eunuchs; and on each corner a spire, with a gilded ball on the top of it. There are seven other tents within this pavilion, particularly one for the king, so contrived that it may be easily removed from one place to another. Next to the king's pavilion are the tents of the noblemen and great officers of state; the tents for the Arabians, covered with goat-skins; and in the center of all is a kitchen, supported at the king's expence. The light-horsemen are quartered near the pavilion, and next to them are the stables, where their horses are well fed. The baggage men, butchers, and victuallers, are quartered without the Brill, and whoever comes to the camp must proceed no farther than that quarter, unless they have permission from the king's secretary. Some watchmen are placed to guard the king's pavilion, as well as the stables, all the night long; but they are poor helpless creatures, having neither arms nor ammunition; and sometimes they are so negligent in their duty, that any person who pleases may come into the king's pavilion. The king lives the greatest part of the year in the fields, both for the safety of his kingdom, and to keep the lawless Arabs under proper restraint.

About ten miles from the city of Fez is a noted mountain, called Zarbon, which is ten miles broad, and thirty long. Here are large plantations of olives, but they do not come to much perfection. There are about fifty sheepfolds and booths upon it, and the convenience

convenience of its situation between Fez on the east, and Manasse on the west, renders the inhabitants very rich. The women of this country are in general dressed in woollen, and adorned with silver rings and bracelets. The men are brave, and noted for taking of lions; and those they send to the king, who keeps them for his amusement, and hunts them in the following manner:

Several little cells, in which a man may stand upright, are made in a large field, and secured with strong doors. In each of these an armed man is placed, who shewing himself to the lion, and upon the lion's approach shutting himself up, inflames his fury; upon which a bull is let loose upon him, and if the bull kills the lion, the sport is at an end; but if the lion kills the bull, all the men in the cells, who are generally about ten or twelve in number, jump out upon him, being armed with a javelin and a pike, of a cubit and a half long. If the armed men seem to be too hard for the lion, then the king orders the number to be diminished; and if they seem to be too weak, he and his attendants shoot at him with cross-bows from a lofty eminence, where they sit to see the sport, if such barbarous diversion has any right to be called by such a name.

It frequently happens that some of these cross-bowmen are killed by the lions; but the person who encounters the lion is rewarded with ten ducats and a suit of cloaths; but none except those who are reputed for their valour are permitted to be engaged in these battles.

On this mountain there is a town called Gnalibii, which was once very populous, but has now fallen to decay; and upon the side of the mountain is another town, called Retna Roffa, which stands so near the forest, that the lions come sometimes and pick the bones like dogs, without hurting any person. At the foot of the mountain, leading towards Fez, there stands Castle Shame, so called from the shameful covetousness of the inhabitants. It is reported, that as the king was one day passing by, the people invited him to an entertainment, in order to get the ignominious name taken off, and next morning prepared for his breakfast a couple of rams, and some large vessels filled with milk and water, supposing the king would not know but it was all milk; upon which the king perceiving the milk to be half water, smiled, and said, "What nature hath given, no man can take away."

The next province adjoining to this, does not merit a particular description, only that there are vast numbers of lions in it; but they are so easily frightened, that nothing is more common than to call a coward by the name of Azgar, which is the name of the province. There are a vast number of woods here, with rocks and precipices, all of which are inhabited by wild beasts, but the people are so much accustomed to, and acquainted with them, that they are no more afraid of them, than we are of our common dumb animals.

The next province is Habet, where there are very pleasant cities, surrounded by delightful gardens, refreshing streams, and well cultivated fields. Here we passed by many of these plantations, till we came to Arzilla, built by the Romans, upon the shore of the Ocean, about seventy miles from the Straights of Gibraltar, and one hundred and forty miles from Fez. In antient times it was subject to the princes of Ceuta, who were tributary to the Romans, but it was afterwards taken by the Goths, who restored the provinces of Ceuta to their antient government.

In this manner these princes continued to govern this province, till the Arabians invaded Spain, who overturned the whole form of government; and after they had kept it in their possession upwards of two hundred years, it was again taken by some Europeans, whom Mr. Harrison imagines to have been Danes; we mention this circumstance, because Leo calls them Englishmen, whereas, at that time, there were no adventurers from England, but the Danes were mak-

ing settlements in every part, their own country being too confined to contain them.

The design of the Goths was to draw the Mahometans out of Europe, for they being Christians, were enemies to the new invaders, who worshipped idols. This put an end to all their attempts for the future, and from that time till the present the people have become so mixed, that there is scarce a possibility of making a distinction. A doubt, however, arises concerning these Danes, whom Leo calls English; for although the Danes, under the name of Romans, made many conquests in different parts of Europe, yet we have no account of their having settled in Africa, at least we have not any from good authority. The subject, indeed, is not worth writing on, and therefore we shall take leave of it.

The country all round this place is finely cultivated, affording almost all the necessaries of life, so that the villagers would live extremely happy, were it not for the distance they are off from the woods, whereby they are often in want of fuel; but they have some coals, which are brought hither in waggons. About the middle of the ninth century, this city was surpris'd and taken by the Portuguese, who carried most of the inhabitants prisoners to Portugal, and among the rest some of the princes of the blood. Among these prisoners was Mahomet, the heir apparent to the crown, who was ranomed soon after he was taken.

The next place we visited was Tangier, an antient city, well known to the Romans, and much esteemed by the Portuguese. This city was given as part of the marriage fortune with Catherine of Portugal, who was married to Charles II. of England, and the Earl of Middleton, a Scottish nobleman, was one of the first governors of it. Here it was that Dr. Addison, author of the famous poet of that name, was for some time chaplain, and who has left us an accurate account of the western parts of Barbary. It did not, however, remain long in the possession of the English, for the unsettled state of affairs in the reign of Charles II. of England, drew all things into confusion, and it was delivered up to the Portuguese for some settlements in the East Indies. It is not our business to enquire how far this measure was consistent with sound policy, because that depended on a variety of circumstances, and an almost endless chain of arguments. Sovereigns will act that part they approve of, and subjects are obliged to submit. This consideration should silence those who are continually finding fault with government, because it cannot be supposed, that individuals have it always in their power to enquire into the public conduct of ministers.

From this place we proceeded to Civitas, so called by the Romans, who used to keep a garrison here; it was built just on the Straights of Gibraltar. In former times, it was the capital of all Mauritania, and being much valued by the Romans, was peopled by them with many civilized inhabitants. Upon the decline of the Roman empire, the Goths took possession of it, and kept it till it was invaded by the Mahometans, much about the same time that the Moors invaded Spain. After that it became the most famous city in Mauritania, both for politeness and number of inhabitants. It is adorned with a great number of mosques, with schools and colleges for the education of youth, and resorted to by all those who wanted to make improvement in learning.

The fields adjoining to this place are cultivated with great care, and they have something beautiful in their appearance. There are a great number of pretty villages, especially where the vineyards are situated. From hence there is a noble prospect of the Spanish coast, and every object is visible, the distance not being above twelve miles.

Such was the state of this famous city, till it was taken and razed almost to the foundation by Habdalmummem, who was both king and patriarch, and who likewise banished the principal inhabitants. And not long after it was sacked by the king of Granada, who carried the noblemen and chief citizens along with

with him to Spain, and at last it was taken by the Portuguese, when all the inhabitants abandoned it. The cowardly king of Fez, who did nothing at all to support it, was punished in a manner suitable to his demerits. His six sons were murdered by his own secretary, whose wife he had attempted to debauch, and the bastard son who succeeded him was in like manner slain by his own people, and was the last of that branch in the regal line.

Mount Quadret, in this kingdom, is famous for the birth of Heliceb, who distinguished himself by his valiant exploits against the Spaniards, and at last was killed in battle fighting against those people. Sixty thousand Moors fell along with him, and none escaped but the king himself, and a few of his courtiers. This battle may be called one of those which generally turns the events of war through the preponderating scale, according to the rule of Divine Providence. From that time the Moors never could keep their ground in Spain, but were either put to the sword in cool blood, or forced to renounce the religion they professed; all which was a direct violation of the natural dictates of their conscience.

We came next to the antient town of Bedis, in the province of Eris, situated upon the shore of the Mediterranean, containing about six hundred families, so that it is a considerable place. There is no water here fit for drinking, except in one well in the neighbourhood. This well is situated near the sepulchre of one who was once famous among them for the cure of diseases, but they never make use of the water but in the day-time, because it has many leeches in it. However, it is adorned with a stately temple, and so overstocked with fish, that they give them away to the poor, especially to those who help to draw up a net, for one man has not strength to do it.

These fish are much the same as we call pilchards, and these they salt, and send up into the country to be sold. There is one long street wholly inhabited by Jews, many of whom deal in wines, and in the evenings the people divert themselves with their pleasure-boats on the sea.

Ferdinand king of Spain, having built a fort on an island opposite the town, the inhabitants applied for help from the king of Fez, who accordingly sent them an army, but most of them were cut off by the Spaniards. However, the Moors soon after prevailed, and having taken the place, put every one of the Spaniards to the sword. The buildings in this town, although antient, have nothing in them either grand or curious; they have several mosques, which are very small buildings; and as for their public structures, they are hardly worth mentioning. The gardens, however, are curious, and very beneficial towards promoting the health of the people.

The next province we visited was Garet, which is divided into three parts; the first having several mountains in it, the chief of which is called Beniquazeul, and on it is a town very well peopled. Here a linen manufactory is carried on, and they have all other sorts of trades that are used in this country. The adjacent fields are wonderfully fertile in grapes, quinces, and citrons, which are all sold at Fez, and bring in a considerable revenue. This town has an exceeding good market, frequented by the inhabitants of the neighbouring mountains, who bring vegetables to it, and in return take such goods as they want. At a short distance from the city, there is a cave on the top of a mountain, which continually throws up fire, in the same manner as volcanoes in the other parts of the world.

The next mountain is called Beni-Mosgaida, and on it is a college, where Mahometan doctors are instructed. Here are always a vast number of students, and they are not obliged to pay any taxes. It is not an easy matter to get acquainted with the form of education used by these people; but, so far as we can judge, it consists in the students reading a chapter in the alcoran, and then the doctors deliver a commentary on it, partly critical, and partly practical. Once in every

week, the students, who are pretty far advanced in their education, deliver a critical commentary on a chapter in the alcoran, upon which he makes his remarks, so that this method is not much unlike our scholastic divinity.

There is a small town near this mountain, which deserves our particular notice. It is called Melili, and the inhabitants having been threatened with an invasion by the Spaniards, and finding the king of Fez not in a condition to assist them, deserted the town, and fled with their effects to the mountains of Buthew. This conduct irritated the governor under the king of Fez so much, that rather than any thing of value should fall into the hands of the Spaniards, he set fire to all the public buildings. However, the Spaniards took possession of the ruins, and built a strong castle near where the chief mosque had stood, and remained in possession of it long afterwards.

The desarts of Garet are bounded by the Mediterranean sea on the north; the desarts of Chauz on the south; the mountains just now mentioned on the west; and the river of Mulvia on the east, being about sixty miles long, and thirty broad. Throughout the whole of these desarts, there is no water but that of the river Mulvia, which in summer is frequently dry. The Arabs who live here are excellent horsemen, but in their manners fierce and unfociable. They are divided into different tribes, and are almost continually at war with each other.

Chauz, the next province we visited in this part of Africa, is situated to the south of Garet, and the roads through it are much infested with wild beasts, especially those leading towards the borders, but it is not so near the capital. Dubda is the name of the capital city of this province, and was formerly adorned with many grand magnificent structures. It was built and adorned in this manner by one Mahomet, who formed a design of wresting Fezza out of the hands of the king of Fez. His design was, to go in disguise to the market-place, not doubting but he could get many of the inhabitants to join him. In the mean time, the king of Fez was informed of the plot, and marching against Dubda, with a vast army, encamped at the foot of the mountains. Six thousand of the inhabitants lay in ambush among the rocks, who, after the Fezzan soldiers had gone up the difficult passages of the mountain a good way, so that they could not get conveniently back again, sallied out and killed three thousand of them.

But the king of Fez not intimidated, marched among them with five hundred cross-bow men, and three hundred musketeers, to make a new attack, upon which Mahomet, finding he was not able to defend himself any longer, disguised himself in the habit of an ambassador, and went and delivered a letter with his own hand to the king. Being asked by the king what he thought of Mahomet, the governor of Dubda, he answered, he thought he was mad, in offering to withstand his majesty; then the king threatened to tear him in pieces as soon as he was master of the town, upon which the feigned ambassador asked the king, whether he would not receive him into favour upon a submissive acknowledgment of his offence? His majesty promised, upon that condition, not only to pardon him, but also to give his two daughters in marriage to his two sons; and for his farther security, backed his promise with a solemn oath, in the presence of four of his principal nobility; upon this Mahomet fell on his knees, acknowledged his crime, and the king made good his promise.

Fezza stands upon the road from Garet to Cassada, at the distance of fifty miles from Fez, one hundred and thirty from the ocean, and seven from the Mediterranean. In former times this city contained no less than five thousand families. At present it has a great number of mosques, schools and colleges, with other public edifices, all of which are very pretty structures. The other buildings, namely, the houses, in which the citizens dwell, are very mean structures, having little or nothing in them worthy of notice. A small river runs through the chief temple, that springs

out of the mount Atlas; and sometimes when the citizens quarrel with their neighbours, these incommode them very much, by cutting off this river, and hewing it into another channel, than which nothing can be more afflicting in a country generally parched up with the heat; for besides it, they have nothing but stinking water, and this often forces them to sue for peace.

In riches, and in the civility of the inhabitants, his city is reckoned the third in the kingdom, and the chief mosque is greater than that at Fez: besides which it has three colleges, several baths, and a great many hospitals. Each trade in this city has a place allotted for it, in the same manner as at Fez. The inhabitants are remarkable for their valour and generosity, and there are a great many rich and learned men among them. The adjacent fields are extremely fertile, the places adjoining to the city walls are very large, and enriched with many pleasant fountains, that serve to water their gardens, for without gardens and shady bowers the people in this part of Africa would be rendered incapable of doing any business.

They have great plenty of fruit, and their vines produce sweet grapes, which are mostly bought up by the Jews, of whom there are seldom less than five hundred families in the place. In this city we saw an aged man, who was so much revered, that the people came at least fifty miles to pay their respects to him: and this man, who was very artful in deluding the people, was prodigiously rich in grounds, fruits, and other commodities they had given him.

The next place we visited was Saffro, which has a mosque, with a river running through it, and an excellent fountain at the door for the people to bathe in. Adjoining to it is a forest, where the lions are so tame that one may stroke them like dogs. The buildings are mean, but the gardens are delightful, although the people are far from being so social with strangers as in some of the places already mentioned.

A few miles distant is Ham Lisnan, a city very antient, where, when the Africans were heathens, they had a temple. This temple was much resorted to in the night time; and after the performing of sacrifices, they used to put out the lights, and divert themselves with promiscuous embraces. The children begot in this scandalous manner were brought up by the chief priest of the temple, and set apart for sacred service; but the women, who acted their part in this affair, were prohibited from laying with any man for one year afterwards. The people here have many ridiculous superstitious notions, which seem to have been derived from heathenism, as indeed most of these things are.

In the province of Dubdu is a mountain subject to the government, but it is inhabited by a base inhuman race of people. Their houses are made of rushes, gathered on the sea shore; and on the mountainous parts there is a grain, called paumish, of which they make bread, and other victuals; but at the foot of the mountain are fine gardens, pleasantly laid out, in which are grapes, dates, and peaches. They dry their peaches in the sun, cutting them into quarters, and throwing away the stones, which sometimes serve them for money, that being a very scarce article among them. They have some iron mines, of which they make blunt-pointed daggers and horse-shoes. Their women are proud of wearing iron rings on their fingers and in their ears, and go almost naked, their time being chiefly spent in the woods, where they keep goats, and gather fennel.

Further along, towards the south-east, is another mountain, called Selebgo, inhabited by a people who descend to the vallies every spring, taking their houses, composed of rushes, along with them; and they continue there till the end of May, at which time they are driven away by the Arabians, who come there with their cattle. But in the winter these Arabians resort to woods, and warm places, to shelter their camels, who are so tender, that they cannot bear much cold. On this mountain are amazing numbers of

lions, leopards and apes, and it gives rise to Subu, the greatest river in all Mauritania. It has a stream of water that runs so rapidly as to carry a stone of a hundred weight along with it.

The grand river divides two provinces, and all along the banks are vast numbers of villages, well inhabited. As there are several mountains, two nearly adjoining to each other, so they have a very strange way of pulleying men from one to another. This is done by a great hamper, capable of holding ten men; that being fastened to a rope, which runs from a strong post on one side, to another on the opposite side. But this airy bridge is not always very safe; several accidents frequently happening. This mountain affords plenty of oil, great store of cattle, and very fine wool, of which the women make cloth as fine as silk, and sell it at Fez for a great price.

The next mountain to this is Centopozze, where there are a great many houses, and a dreadful deep pit, into which some people have been let down by a rope, with torches in their hands, who report, that below it is divided into a great many rooms, and at last they come to an artificial cavern, hewn out of the rock, and encompassed with walls, having four doors, leading to some narrow places, in which are cooling springs of water. Some of these bold adventurers have lost their lives in making the discovery, for when their lights are put out by any sudden blasts of wind, they can by no means find the place where the rope hangs, and so perish by famine; and of the truth of this we have the following instances, the reality of which cannot be disputed.

Three men having been let down, went to the four doors above mentioned, where they parted, one going one way, and the other two another. After the two that kept together had gone about a quarter of a mile, one of their lights was put out by a swarm of bats. At length they came to the springs, where they found the remains of white mens bodies, some of whom were consumed, and others fresh. They returned the same way they came, but were scarce got half way, when a sudden blast put out their remaining light, upon which they continued groping their way in the dark, expecting every moment to fall into some pit. They had left some of their companions at the mouth of the pit, and they let down a man to see what was become of them, and he having a light in his hands, found them out, and brought them up. But the third, that went by himself, was not found at that time. He wandered up and down in a forlorn condition, and at last hearing a noise like the barking of dogs, went up to them, and met four strange young beasts, attended by their dam, not unlike a she wolf, which fawned gently upon him with her tail. Soon after that he began to perceive a glimmering light, and so found his way to the mouth of the pit, where he was drawn up by his companions. Such a vast number of accidents happened here, that the pit is now filled with water, so that no person can go into it.

Near this mountain is Cherbeen, that is, the mountain of Ravens, altogether covered over with woods, and in it are a great number of lions. There are no human creatures residing here, owing, perhaps, to its being so much infested with wild beasts, and its coldness in winter. There is a very high mountain, the top of which is covered with an almost infinite number of crows and ravens, from which the mountain derived its name. Sometimes the terrible northerly winds bring such amazing quantities of snow upon this mountain, that those who travel from Numidia are frequently lost in it. Every summer the wild Arabs resort to this mountain for the benefit of its cooling shades, for they pay no more regard to the wild beasts than if they were domestic animals. The ferocity of their tempers, and their savage dispositions, makes them forget all manner of danger; for those who have but little worldly substance to lose, often think life itself hardly worth regarding.

The last mountain we shall mention is Ziz, inhabited by a band of barbarous thieves and robbers, who

who are at continual wars with the Arabs, as well as with the other inhabitants of the country. These robbers are so horribly audacious and cruel, that when they cannot take away the camels, they throw them over precipices, and so break their necks. In this place there are so many serpents, that it is extremely dangerous for a stranger to travel without a guide.

Such is the account left us by Lee concerning the vast continent of Africa, and we are glad to find that it contains accounts of things with which many other travellers were utterly unacquainted. His going through those inhospitable deserts in a public character, gave him an opportunity of seeing more things than he otherwise would, had he only gone in a private capacity. Indeed it is in a manner impossible to travel through these deserts without the assistance of the civil power; and the ingenious Mr. Bruce told the author of this, that nothing less than the most unbounded curiosity could ever have induced him to traverse the deserts of Lybia. How far that gentleman has been rewarded for his labours, is not our business to enquire. Sovereigns are not always strangers to merit, and we doubt not but the best of princes has made him an ample amends for the hardships he underwent, the difficulties he had to encounter, and the vast discoveries he made.

We shall now proceed to relate what Sir George Sandys has written concerning Africa and the other places adjoining to it, particularly some of the islands in the Mediterranean. Rhodes (says Sir George) is now inhabited by the Turks; for although there are some Jews in the island, yet they are treated with so much cruelty, that nothing but the want of means to remove could induce them to remain in this place. As the knights templars were many years in possession of this island, so they have left behind them many monuments of their grandeur; and some of these are still preserved, notwithstanding the severity of the Turkish government. We saw no land after we left Rhodes till we landed at Alexandria; a city so well known, and so often described, that it is needless to add any thing to it.

From Alexandria we proceeded to Cairo, and six days journey up the river above that city brought us to Sarit, where the inhabitants have a tradition, that Christ and his mother, with Joseph, resided here when they fled from the rage of Herod. Such Christians as reside in the neighbourhood of this place, when they find themselves growing old, come here to leave their bones; and there is a handsome church built by Helena, the mother of Constantine the Great. The Greek Christians wear round caps upon their heads, and towels about their necks, with gowns of light stuff. They live in great subjection, and pay an annual tribute to the basha; but many of them retain the vices of their ancestors, without being acquainted with any of their excellencies. Indeed this is not much to be wondered at when we consider, first, the wretched state of the Greek church; and, secondly, the severity of the government, which, by the exertion of lawless power, has brought the innocent inhabitants under the most abject slavery.

The laws here are very strict against those who abuse strangers; for it is the interest of the Egyptians to give all the encouragement they can to Europeans. This is in all respects consistent with sound policy, for the Europeans spend considerable sums among them.

One day as we were walking along we were very ill treated by one of the natives, who attempted to make us fools and laughing-stocks to all the company; for they look upon Christians as no better than dogs, and indeed they call them by no better name. In the mean time one of the magistrates came up, who ordered the fellow to be taken into custody, and the executioner gave him no less than one hundred strokes on the soles of his feet.

Having already described Egypt at large from the travels of Dr. Pocock and Mr. Norden, we shall follow Sir George Sandys from that country to Malta,

which is generally believed to be the Melita mentioned by the evangelist St. Luke, in his account of the voyage of the apostle Paul from Syria to Rome.

On the second of June we entered the harbour of Valetta, in the island of Malta; but they would neither suffer us to land, nor proceed on our voyage for some time, because they were then fitting out several galleys; and they did not know but we were spies on their conduct, who might give an account of them to the enemy, that is, to the Turks; for these knights of Malta take a solemn oath, when they are invested with the ensigns of their order, never to make peace with the enemies of Christianity. The grand master was then absent, but he returned in the morning, and granted us leave to proceed; for the English are always treated with great respect by the people of Malta.

I (says Sir George Sandys) who could never be reconciled to the sea, desired to be left behind, so that I was put ashore on a noted promontory near adjoining to the city, remote from the people; but I was at a loss how to dispose of myself. At last a little boat made towards me, rowed by an officer, whose business it is to attend on strangers who have not received passes and protections. This man carried me to the hollow of a tree, where I was to take up my lodging for that night, and the next day he was to carry me to the lazaretto, where I was to remain forty days longer, till it should be found whether or not I was afflicted with the plague.

In this melancholy condition I continued musing on my hardships, while my guardian was gone for some victuals for me; but in the mean time this lucky accident happened; a small boat came to the harbour, in which were two old women, who laid a Turkey carpet upon the rocks, and upon that a table-cloth, which they furnished with an abundance of choice sweetmeats. A little after them came another small vessel, which put on shore a gallant with two of his mistresses, dressed like nymphs, with lutes in their hands, full of fondling tricks, scarce giving the spark leave to eat a bit but what they put into his mouth.

Upon enquiry, I found that the old women who had treated me with so much kindness, were the mothers of the young ones, whom I had seen land with the gallant; and it naturally led me to conclude, that parents in this part of the world have no great regard to moral duties. I learned upon further enquiry, that nothing is more common in this country, than for mothers to sell their daughters to the knights of Malta. These knights, by their solemn oath, are not on any account whatever to marry; but as it is difficult to divest men of human passions, so these knights are permitted to keep as many girls as they please.

The gentleman who had brought the young women on shore was a French captain, and he invited me to dine with him, according to the common politeness of his country. This I cheerfully accepted of; and such was the good-nature of this gentleman, though inconsistent with prudence, that he offered to convey me into the city at night, and bring me out in the morning; a crime which, if discovered, is punished with death.

While they were persuading me to this, which I had no desire to comply with, my guardian returned, and a Maltese along with him, whose father was an Englishman. As soon as he understood what they had been persuading me to, he endeavoured to point out the danger that would attend it; so the captain having promised me his good offers, returned. He had hardly got out of sight with his females, when they walked towards the shore; and the women behaved in such an indecent manner, that it ought not to be mentioned.

The captain did not forget his promise, for next day he waited upon the grand master, and gave him such an account of me, that I received a passport to come into the city, and was kindly entertained in the house of the Maltese already mentioned. But it is proper that we should describe this island, not only on account of the repute it has obtained in history, but

likewise in connection with a variety of other circumstances. It has withstood the whole force of the Ottoman empire during a long series of years, and the Turks call it in derision the Rock of Malta; yet they have never been able to subdue it. It has been a nursery for the bringing up the bravest generals that ever lived in Europe since the latter end of the thirteenth century; and although superstition has hindered the knights from marrying, yet they are no strangers to the social duties, but, as men of honour, consider themselves as restrained from doing a dishonourable action. They have long been an ornament to those armies belonging to Roman-catholic princes, and many of them have lost their lives in fighting against the enemies of Christianity.

Malta lies in the Lybian Sea, exactly between Tripoli, in Barbary, and the south-east angle of Sicily, one hundred and eighty miles distant from the former, and sixty from the other. It is in circumference about sixty miles, and was formerly called Melita, on account of the vast quantities of honey found there. The country is all over rocky, covered with earth not above two feet in depth. There are few trees here besides those which bear fruit, and of such they are provided with all forts.

As for fuel, they are obliged to bring wood from Sicily, except what is used by the common people, which is a sort of thistle mixed with cows dung. But they have little occasion for any, the climate being extremely warm; for although there are sometimes refreshing breezes, yet these are of such a short continuance, that the sultry heat returns, and the people become so languid, that they are altogether unfit for business. Here are no rivers, but there are many pleasing fountains, in which the people bathe; for although that is not an article of their religion, being Roman-catholics, yet it is very conducive towards promoting and preserving their health; and probably it was from this, more than from any restraint in religion, that the eastern nations first contrived this practice.

The soil produces no sort of grain besides barley; but the villagers make bread of olives, and their cattle feed on straw. They have plenty of cummin-seed and anniseed, which, with vast quantities of honey, they sell to those merchants who trade in the Levant.

The inhabitants of Malta were originally a colony of the Phœnicians, who trading as far as the main ocean, happened by accident to settle in this island; and finding success attend all their endeavours, they built the antient city of Malta, which in time has given name to the whole island. Their language is a mixture of Italian and Moorish; but indeed it is so much corrupted, and the people are in general so ignorant, that it is no easy matter to make any sense of it. When the Spaniards conquered the island of Sicily, they added this to the rest of their new-acquired territories; but a religious dispute wrested it out of their hands. It was agreed upon among the Christian princes, that it should be given to the knights of Rhodes, in consequence of their having been driven out of the island of Rhodes by the Turks; and this leads us to say something concerning this famous order.

They were originally called the knights of St. John, and their first residence was at the hospital of St. John of Jerusalem, which gave them the name of knights hospitallers. That place was built by one Girard, about the time the Christians were very successful in their expedition into the Holy Land, or, to speak in plainer language, during the croisades, which are a disgrace to history.

At first these knights obtained great repute, and so much were they respected by the court of Rome, that pope Celestino the Second granted them a charter of incorporation. Pope Honorius the Second ordered, that they should wear a black garment, with a white cross; and Raymond, the first master of the order, enlarged their canons, and called them "The poor servants of Christ, and guardians of the sepulchre at Jerusalem." In every country they had revenues

assigned them, and hospitals built for their reception. Many devotees injured their families by disposing of estates in their favour; and such was the madness of the people, that although they could not tell whether these men were clerical or military, yet they looked upon them as more than human.

By their vows, they were to entertain strangers, to learn the military discipline, and to be ready at all times to lay down their lives in defence of the Christian religion in general, and particularly in defence of the civil rights of that country where they happened to reside, or with which they had any connection.

When the Saracens drove the Christians out of Syria, the Greek emperor gave them Rhodes as a place of settlement; but they were driven from thence; and, as we have already observed, came to settle in Malta. There are about three thousand of these knights, all of whom wear crosses; and they are all under a grand master, who actually ranks with the sovereign princes of Europe. Many of these princes have high command in the European armies; but they are obliged to return to their duty in the island when the grand master commands them. There was not in Europe, before the Reformation, so far as we know, one single nation where these knights had not a house, with vast revenues to support them. It is true, they were accused of unnatural crimes, and probably there was some reason for the accusation; but it is still more probable that their vast emoluments made them objects of envy; and rapacious courtiers, paying no regard to natural justice, seized on their estates, and decreed that they were unworthy of a place in human society.

But although they were abolished under the name of knights templers, yet they continued under the name of knights of St. John of Jerusalem, till the Reformation in England, at which time their famous monastery at Clerkenwell was in such high estimation, and the rents for the support of it so great, that on the dissolution of religious houses, the abbot was allowed no less a sum than twelve hundred pounds a year for life.

There are sixty villages in this island, under the command of ten captains, besides Old Malta, which is situated in the centre of the island, upon a hill, in the shape of a crescent. The city is far from being well fortified, and yet a garrison is constantly kept here. There is a pretty grotto here, in which they tell us St. Paul lodged after he had been shipwrecked; but we have great reason to believe, that the apostle was shipwrecked on another island, near the coast of Dalmatia; but this is not worth contending about. They add farther, that it was in this grotto that the viper fixed upon the hand of the apostle, which is contrary to the scripture account in Acts xxviii. where it is said this affair happened in the house of one of these barbarians, who shewed him no small kindness. There is, however, one conclusion to be drawn from this mutilated account, which may serve to point out, if not to prove, the truth of the gospel history.

It is almost an universal maxim, that where there is nothing genuine, nothing can be counterfeited: thus, if we had no genuine coin, we should have no vagabonds hanged for counterfeiting it. If we had no notions of moral justice, we should have no persons in the world setting up systems diametrically opposite to truth; and had Christianity never been established, in consequence of the almighty power of God, perhaps we should never have a hypocritical teacher among us. Thus, to come to the purpose, had not what the apostle Luke related concerning St. Paul, been true, why all these traditional accounts of this remarkable event? The people in the island are too stupid to have invented any such thing, but it was handed down to them by oral tradition; and although they have substituted grottos instead of houses, yet this has no connection with the argument. The nature of local residences are changed in consequence of a variety of unthought-of circumstances; and evidence which seem-

ed weak at first, gains strength, and becomes powerful in consequence of a continual addition; but we hope that every reader will make himself acquainted with this part of the subject, and shall therefore proceed to the latter part of our description of this island.

On the point of the harbour of St. Angelo, is a steep rock, upon which this fortress is built, and at the foot of the rock some cannon are placed, which command the entry into the harbour. It is very strong, but still would not be able to make any defence consistent with the nature of our art of attack and defence at present.

A Mahometan, descended as thought of Christian parents, leaped into the sea here, in the midst of the siege, and, notwithstanding all the shot fired at him, swam to the castle, received baptism, and was of no small use to the besieged, discovering most of the designs of the Turks, and leading on the men into places difficult of access. The gallant behaviour of the knight, and the report that had been spread of a Christian army coming to their relief, discouraged the Turks so much, that they thought fit to raise the siege. However, all the towns and villages on the island, except St. Angelo and Bargo, were reduced to ashes. This induced the knight to consult about leaving it, rather than repair the lamentable ruins that had been made, especially when they considered what a powerful enemy they had to oppose, and the backwardness of the Christian princes to assist them. In this state of uncertainty, and not knowing what to do, they applied for advice to the Pope, who encouraged them to continue on the island, promising that the Italian states should assist them.

At the same time the king of Spain sent them money, with three thousand men, arms, ammunition, and indeed every thing that could be of service to them. This enabled them to repair the fortifications; and the city was called Valetta, in honour of John de Valetta, who at that time was the grand master. The place is

not large, but it is built in a very handsome manner, and, being on a rising ground, may be considered as a very strong fortress. It may indeed be attacked from the sea; but there is no way to besiege it by land, except on the south, for it is built on a sort of peninsula that runs into the sea.

The walls of the other parts of the city join to the rock, as though they were of a piece with it, and are washed by the sea. It is joined to the land by a narrow isthmus, where the rock rises naturally, and the ditch on the outside is cut exceeding deep and broad; being flanked all round with battlements. The only gate of the city opens this way; and just facing the entrance within, are two strong bulwarks, with cannon mounted upon them. Besides this grand gate, there are two small posterns leading to the harbour, and there is a tower without the walls, called St. Hermes. The buildings all along are at a considerable distance from the walls, to leave room for the soldiers to make a vigorous defence.

On the west side is a great pit, hewn out of a rock, and a porch is cut under the wall into the haven. In this place all their arms and ammunition are kept, and the galleys are here laid up when out of service. The harbour is too shallow for shipping of any great burthen; but, notwithstanding that, it is extremely pretty and convenient. The palace of the grand master is a noble structure, adorned with a tower, which overlooks the whole island. The council chamber is curiously painted, with the representations of some of their naval engagements, and some of these are fine pieces. The market-place is large, and from it the streets point directly to the walls. The buildings are mostly uniform, of free-stone, two stories high, and flat at the top. In a word, this is a very pretty city, and were it not that the island is extremely hot and sultry, it would be one of the most agreeable places in the world.

JOURNAL OF A JOURNEY TO MEQUINEZ IN MOROCCO.

By the Honourable CHARLES STUART, Commander in Chief of a Squadron belonging to his Britannic Majesty, sent thither for the Redemption of Slaves.

OF this narrative, we can only say, that it was drawn up by Mr. Windfor, secretary to Mr. Stuart, and was published at the earliest request of numbers of our nobility, gentry, great officers of state, and leaders of the highest quality.

The many curious particulars contained in it; the accuracy and integrity of the writer; the sanction it received from government; and above all, the new discoveries contained in it, must render it very acceptable to the public.

Mr. Stuart set sail from England in September 1720, and on the twentieth of October arrived at Gibraltar. At that time the Spaniards, having formed an expedition against the Moors, had already embarked troops; and the ambassador thinking this a proper juncture to begin his negotiation, he, on the twenty-eighth of October, wrote the following letter to the basha of Tetuan.

To his Excellency Basha Hamet, &c. &c.

THE king of Great Britain, my master, having thought fit to recal Mr. Cavendish from being ambassador to the most noble prince, the emperor of Morocco, and having done me the honour to send me abroad to succeed him, I take the liberty to acquaint your excellency of my arrival in these parts, with full powers to treat of a peace with your excellency, or

any other person or persons his imperial majesty shall appoint. And as the British nation is sensible of your great esteem for them, and the readiness you have always shewn towards a friendship and peace between the two nations, (though I do not know, whether by destiny or mismanagement, the so long desired peace has been retarded) I am still in hopes your excellency will continue your great zeal for the common good of both nations, since I am come with a firm resolution to employ my honest and best endeavours towards that good work, and the more, because your glory and advantages are to be the fruit; but it is necessary this negotiation should begin as soon as possible, that I may be made sensible of the intentions of his imperial majesty, whether he will make use of this opportunity of settling that peace and friendship, which the king, my master, has so long desired; for since I am employed on another command upon the sea, against those which at this time ought to be enemies to the emperor, your master, now that they have invaded your country, yet to shew you the sincerity by which I design to act, I should rather chuse that his imperial majesty would prevent any accident that may happen, by sending such persons to Gibraltar, to treat with me as soon as possible, and put a pushing hand to a treaty so long depending, and which has already been adjusted on both sides.

Provided

Provided this can be done, and the articles of peace confirmed, I shall then very readily in person throw myself at his imperial majesty's feet, to present a letter I have now by me from the king, my master; and shall think myself happy to put myself under your protection for my safety to Mequinez. I commit your excellency to the protection of God, and am,

Your excellency's

Most humble servant,

CHARLES STUART.

This letter was sent with the Experiment man of war, which, on her return, brought over Mr. Cavendish, who came to compliment Mr. Stuart on his arrival, and who brought with him a letter from the basha, signifying the great inclination he had to forward the treaty with the English nation; for which purpose Cavendish was to confer with the ambassador, in order to have it pushed as soon as possible. But the ambassador judging it more convenient to treat in the bay of Tetuan, because the emperor had sent from his court one Moses Ben Hattar, a Jewish merchant, who had been often employed in the former treaties, and was reputed more artful and interested than any other in the country, and chiefly to be considered in regard he had money in his power to make the negotiation successful, or defeat it as he had done some others before.

Upon this consideration, the ambassador sailed with his squadron to Tetuan bay, and there with the said Moses Ben Hattar, who took upon himself to be jointly impowered with the basha, agreed to the articles of peace, which were signed January 17, 1721. After which the ambassador was very much importuned to proceed immediately to Mequinez; but as it was necessary his majesty should first approve of the conditions, and the final ratification come to him from England before he landed in Barbary, he found means to delay the time, till his desire was accomplished.

Accordingly on May 30, he embarked at Gibraltar, having along with him Ben Hattar, the Jew, and in three days afterwards landed in the bay of Tetuan, about nine in the morning, which was much sooner than he expected. The basha was not then come to the coast of the bay, but the ambassador had tents, with all other conveniences for the reception of his followers; and among the tents was a very curious one, sent from Mequinez, for the ambassador's person, at the expence of the emperor. In this tent the ambassador had his first entertainment along with his more immediate dependants; and the victuals consisted chiefly of roasted mutton and fowls, which they placed on a table, in rather a more awkward manner than is used in Europe; but the easy agreeable manner in which the people behaved, made amends for all these informalities.

About four in the afternoon the basha came down from Tetuan, attended by above two hundred men on horseback, and three hundred foot, who entered our camp with a great deal of ceremony, forming themselves into a semicircle, and discharging pieces before our tents, where the basha gave us the diversion of seeing him and his people exercise for above half an hour, which they performed with great activity. The basha was attended by his brother, and they both headed parties of horse, who all clapping their spurs to their horses sides, levelled their pieces, and fired at each other, as if they had been really attacking an enemy, which we considered as a Moorish review.

After that they took their spears, and singled each other out to fight, very dextrously putting by the thrust of the spear, while their horses were running at full speed; during the time of the cavalcade, the foot keep a continual fire, but irregular; every man charging his piece, and firing into the ground as fast as he could. Their drums made a very solemn and warlike sound, but they are not beaten after our manner, but with an heavy stroke on the top, and a small one underneath, keeping time to a pipe, something like a

fife, but very loud and shrill. The cavalcade being over, and word being sent that the basha was approaching the ambassador, he went out to meet him, attended by the principal persons in his retinue. The basha welcomed the ambassador to Barbary, and invited him to his seat, where he told him he would do all that lay in his power to make the country agreeable to him; that he liked the English better than any other Christian nation; and some more compliments having passed between them, they parted for that night, the basha laying in his own tent.

Next day, being Sunday, the ambassador visited the basha in his tent, and the latter renewed his kind expressions in favor of the English, and his desire that the ambassador should find every thing agreeable. After that, says Windus, as we were walking about to see the camp, we had an instance of Ben Hattar's unlimited power over the Jews; for he having employed one Ben Saphet as his agent or factor in Gibraltar, found, upon going thither himself, that he had wronged him considerably, reported things falsely, and dealt unfaithfully in his commission; wherefore as Ben Saphet was now coming down to meet him, before he could get within hearing, Ben Hattar ordered him to be strangled; upon which the Jews, and some blacks belonging to the emperor, immediately ran to him, pulled him off from his mule, and in an instant stripped off his cloaths, and put a rope about his neck, which they began to draw, and in that manner bringing him nearer to us, pale and gaping, he cried out to the ambassador to intercede for him.

The novelty of such an act of arbitrary power kept every one in surprize, wondering what would be the event; but after Ben Hattar had reviled him in the most taunting manner, he ordered that he should be carried to the common prison, where, as we afterwards heard, he was daily bastinadoed, as well for the fault he had committed, as to make him discover where his effects were concealed, which Ben Hattar seized on for his own use.

About eleven in the forenoon the basha caused a regiment of fine horses to be drawn up together, which made a noble and martial appearance, many of their saddles being covered over with silver, and he desired the ambassador to take such of the horses as best pleased him. Then every one of us having provided for ourselves, according to our demands, we began our journey in order to set forward. We had about six miles, or rather more, to travel to Tetuan, and during the whole of the journey the Moors continued firing, as marks of congratulation. When we entered the town, there were vast crowds of people to receive us, shouting and hallooing, testifying every mark of respect. The women were dressed in white, so that no part of their faces could be seen except their eyes; but they did not come into the streets, for they stood upon the battlements of the houses.

The basha drew up his people in a large square before his house, where he and his brother, being exceedingly well mounted, shewed us again how dextrous they were with their spears, tilting a considerable time, and sometimes darting their lances into the air before them, and catching them again, as their horses run full speed. Then the ambassador was conducted to the house appointed for him, which was one of the best in Tetuan, and a stable of horses ordered for him and his retinue.

On the next day the ambassador went to visit the basha at his own house, who received him in an outward room, or hall, built long and narrow, as most of the rooms in Barbary are; the reason of which is, because of the scarcity of lofty timber in that country. There were two chairs placed opposite to each other, in which the ambassador and basha sat down, and talked together for about an hour and an half, during which time, eight or ten of the principal Moors of the town, who seemed to be officers of state, stood behind the basha. The conference being over, we were shown the basha's gardens, and stables, in which were a great many fine horses. Indeed the treatment

we met with here was, in all respects, consistent with politeness and good manners; and the basha's brothers, who were remarkable for their courteous behaviour, spent several days in our company, doing every thing in their power to oblige us, and to make our situation in a strange country as agreeable as possible.

On the fourteenth the basha, and another of his brothers, came to visit the ambassador. The basha came a little after dinner, and staid all the afternoon, looking over some of the presents for the emperor. The basha's brother, who was deputy governor of Tetuan, came towards the evening, and brought along with him some others of his brethren and relations, whom the ambassador treated with coffee and sweetmeats.

The fifteenth, we dined in a garden belonging to the basha, about three miles out of town, that he had costly planted. It stands in a pleasant valley, almost surrounded with hills and mountains, which being green and woody, every where afford a most delightful prospect. There runs a small stream through the garden, which, by great labour, was conveyed from an adjacent mountain. We dined under a large tree, that afforded a pretty good shade.

The governor of Tetuan came just after dinner, and, walking with us, was so complaisant as to gather and give us the best fruits, such as oranges, lemons, and small apricots, of a very fine flavour. The walks are separated with cane work, and there is an arbour of the same, very well contrived, in which there being a basin, supplied with water from the stream, the ambassador filled it with punch, and with much difficulty persuaded the governor to drink two or three glasses. Great quantities of carnations coming in through the cane work, make the arbour very delightful.

The governor had his music along with him, which consisted of four persons, two of whom played upon small instruments, after the manner of violins; one had a piece of parchment drawn tight over a little broad hoop, with pieces of loose tin on the sides, which he shook with one hand, while he drummed with the other; another beat time to their music, by striking the palms of his hands together very loud and forcible.

This part of the country abounds with fine oranges, lemons, citrons, olives, grapes, figs, melons, apricots, and pomgranates.

The seventeenth, we dined in a garden belonging to Cardenash, who had been three different times in England as ambassador from the emperor of Morocco. The walks were finely shaded with orange trees, and after dinner Cardenash made the Moors play at several games, to divert the ambassador, in some of which they drubbed one another heartily.

The eighteenth, we dined with the governor of Tetuan, at his house, who treated us plentifully, there being three or four and twenty large dishes served upon the table at once, high seasoned, and dressed almost after the Spanish manner, and some of them were agreeable enough; for the people here are not so dirty or slovenly as some have represented them.

The twentieth, we went a hunting the wild boars along with the basha, in the mountains between Tetuan and Ceuta; we killed six, and took three young ones alive; but the basha broke his spear in one of them. The spear which the foot carry for this sport, differs from those of the horsemen, not being above half as long, and made of a very heavy and tough wood; the blades about half a yard long, and very thick, that they may not break against the side of the boar. There went a great number of foot, thus armed, along with us, who getting upon the hills round about, made such a hideous noise and shouting, that they raised the boars from the woods and thickets, and brought them in view for the chase. If one of these men should happen to be near a boar alone, he must not give way, nor shew the least signs of fear; but, putting himself in as firm a posture as he can, receive

the boar upon his spear, who goes himself up to the end of the blade, where there is an iron goes across, to stop the spear from running through; otherwise the boar rushing on, would reach the man, and wound him with his tusks. If the man is not strong enough to stop the boar, he quits him as well as he can; but sometimes they will hold the boar, thus gored, on the spot, till the rest come to him, who let out such streams of blood with their broad blades, that the beast presently falls down.

On the twenty-third, the ambassador again visited the basha, and the affairs of our journey being discouraged of, we were informed that the Christians and Jews were to set out directly for Mequinez; but the basha would go first to Tangier, and meet us at Alcazar.

On the twenty-fourth, the governor, and some of the principal Moors of the town, supped with the ambassador, and were very kindly entertained; it being our design to ingratiate ourselves as much as we could into their favour. They did not observe the same manner of eating as we did; but taking all that was given them, some of them gorged themselves so full, that they were obliged to be helped down stairs. The governor continued his usual good temper before the ambassador; but when he got out of doors, being much overcome with the liquor he had drank, he drew his scymetar, and laid about him among his own people, which was owing to his being mad with drink; for on all other occasions he acted as a man of real good nature, of which we had several instances.

At this time an accident happened, which had like to have destroyed the proceedings of the ambassador, and put us all under some apprehensions; for nobody could be certain what might have been the consequence, in a country where there is so little knowledge of the laws of nations, and treaties are of so little efficacy, that they are seldom understood. The occasion was as follows:

Two privateers belonging to Sallee, who, notwithstanding they had the ambassador's passes, conformable to the articles of peace, yet having met with nothing but English ships at sea, and being grown very hungry by a long cruise, made bold with two of them, and sent them into Sallee. Upon this the ambassador absolutely refused to proceed on his journey, and complained of the little confidence there was to depend on any agreement, if actions of this nature went unpunished. The Moors themselves, indeed, seemed to be ashamed of it, and by Ben Hattar's management at court, and the ambassador's resolution to return without going to Mequinez, unless reparation was made, he had the pleasure to find that the ships were released, and the captains of the privateers punished for bringing them in. This was, perhaps, as great a favour as could have been shewn; but the Moors were glad of any assistance we could give them in war time against the Spaniards.

In this place we passed our time very agreeably, either riding out, fishing, shooting, or walking in the gardens, the people being very civil; for the basha had forbid them, upon pain of death, to affront us, as they commonly do Christians, by calling them by the most opprobrious names; and he ordered further, that in whatsoever garden we went, we should pass unmolested, and take what we pleased.

Here, as we were one day riding by the side of the river of Tetuan, we experienced the effect of the torpedo, or numb-fish, some of them laying in the mud. They were about the bigness of a large plaice, and much in the same shape, but thicker, and very round, so that the head could hardly be distinguished from the body; we touched them with our canes while we sat on horseback, during which time a numbness was felt to go up our arms, which continued a minute or two after we had taken our canes off from the fish.

Tetuan is a very ancient city, and was called by the Romans Tetuanum. It gives name to a large province, and is the seat of the basha. It is situated

at the opening of the Straights into the Mediterranean, upon the rising of a rocky hill, between two very high mountains, about six miles from the sea, having a castle built higher on the hill, so that it has a full command all over the town. In the valley runs a little river, which is navigable for small vessels, as far as Monteer, a place about two miles from the bay, where they load and unload their goods. Along the coast are beacons, on which they make fires, to give notice when any attempt is made to land.

The houses in Tetuan are pretty good, but the streets are narrow, and hardly any windows to be seen, but little holes to look out at, the light coming in at the inside of the houses, where there is a square court yard, open at the top, with pillars supporting galleries, and painted wooden balustrades round the inside of the house, almost like some of our inns. If the house belongs to a person of quality, there is a fountain in the court-yard, and the rooms are built long and narrow, there being generally four on a floor, answering to so many galleries, from whence opens into each room a large folding door, by which all the light they have is let in. The houses are but two stories high, except the basha's, and some few others belonging to men of quality in office. They are flat at the top, so that in many places they can walk a great way upon them; but those belonging to Christian merchants have battlements, to keep them within the bounds of their own houses; for the Moorish women live in the upper apartments, and often visit one another from the tops of their houses. All those houses are white-washed on the outside as well as within, which casts the reflection of the sun so bright, that it hurts our eyes to continue near them in the day time. They do not raise the walls of their houses, by laying bricks regularly one upon another, but their way is, first to make a strong wooden case, into which they cast the mortar, and beating it down hard, take the case away when it is dry.

The town is populous and healthy, enjoying a very fine air, but the people are poor, and in general little better than slaves, no man possessing any thing but at the will of the basha, who is as despotic in his province as any monarch whatever; they have an absolute power over the lives and fortunes of the people, giving or taking away whatever they please; for which reason, when a man has acquired wealth by trade, or any sort of industry, he endeavours to conceal it, and to seem poor; for if it should come to the knowledge of the basha, he would throw him into prison, and cause him to be tortured, to make him discover all he has in the world.

The inhabitants are of a swarthy complexion, intermixed with a race of well-looking men, somewhat fairer than the rest. They are generally hearty, strong limbed, and rather taller than the Europeans. They are very good horsemen, active, hardy, and laborious, and being at the same time very poor, a messenger will go from Tetuan to Mequinez, which is one hundred and fifty miles, for a Barbary ducat, and performs his journey with great expedition. They are wonderfully patient of labour, enduring the heat of summer, and cold rains of winter, to admiration; and when the ground is all covered with rain, and a storm overhead besides, they will only look for a bush, or a great stone, sit down on their hams, with their backs towards it, and remain in that posture the whole night, or else wrap themselves up in their garments, and pass the night upon the grafs. Some of their running footmen have been known to go sixty miles in one day, which is amazing, when we consider the heat of the country. They swim the rivers in the depth of winter, if the rapidity of the current doth not deter them. The men are generally slender, eat but little, and, during a journey of seven or eight miles, carry only a little meal, and a few figs or raisins in a small goat's skin.

They have no settled posts in this country, by which intelligence can be conveyed from one place to another, nor any sort of carriages upon wheels, for

their light goods are removed from place to place on horses, if it be not very far; but when they have great quantities either of corn, wax, hides, tallow, &c. and go far, they use camels, of which they have great plenty. If any of the bashas or other superior officers, have any business to transact with the emperor, they send a gentleman to him on horseback; but the ordinary way of sending letters is by the footmen already mentioned, who can travel almost as fast as the horses.

Their manner of dressing is not uncommonly; the men wear short shirts, with very broad sleeves, that sometimes hang down, but are more frequently tucked up to their shoulders to keep them cool. They have linnen drawers, which are tied about their waists next the skin, and reach down to their knee. They go bare-legged, but upon their feet they wear shoes, or rather slippers of red or yellow leather, made very light, without heels. Over their shirts they wear a cloth, and have a vest of any colour they please; and this vest is extremely short, being made to fit close to their bodies. This is fastened with small loops and buttons, set very close together, and is frequently wrought with gold or silver thread. Round their waist they wear a scarf of silk or stuff, as they can afford, in which they stick large knives, whose handles are made of ivory, inlaid with silver. Their outward garment is either an alhagne, or an albornooce. The alhagne is a piece of very fine white stuff, five or six yards long, and about one and a half broad. This they wrap round about them, above and below their arms, and make a figure not much unlike what is seen in the drapery of antient paintings.

The albornooce is either made of cloth or woollen stuff, wrought a great deal thicker than the alhagne, and nearly in the form of a short cloak, but joined a little way before, from the neck downwards, having two or three rows of short stripes worked in the stuff, and fringed at the ends for ornament. The bottom and sides are edged with a deep fringe; behind at the neck, there hangs a peaked cowl, with a tassel at the end, with which they can cover their heads from the inclemency of the weather. Upon their heads, which are always shaved, they wear a little red cap, rolling muslin about it to make a turban; and when they go into the country, they wear a handsome cane hat, to keep out the violent heat of the sun.

All the Moors are dressed in this manner, there being no difference, except in the richness of their vests, or fineness of the other parts of their robes, only that the very poorest of all have a garment called galabica, made of a coarse, thick, woollen stuff, without sleeves, but only holes to put their arms through; it reaches to their knees, and hangs loose about their bodies like a sack. The magistrates who are under the basha's, have a broad leathern girdle, embroidered with gold to hang their scymetars to, and this they frequently wear over their shoulders.

When the women go abroad, they are dressed almost in the same manner as the men, their outward garments being an alhagne, with which they cover their heads, bringing it down over their foreheads close to their eyes, and underneath they tie a piece of white cloth to hide the lower part of their faces. The alhagne covers all parts but their legs, which in general are naked when they are at home, or visit from the tops of their houses; only some of the better sort have their drawers so long, that they reach to their feet, hanging in great loose folds about their legs. Their shoes are the same as the mens; and within doors they appear in their hair, having only a single fillet about their foreheads. Their hair is plaited, and hangs down in full length behind. They wear a vest, which is open from the bosom to the waist, to show their shifts that are embroidered. They put in large pieces of muslin to the sleeves of their vests, which hang down very low, in the nature of ruffles, and their drawers are longer than the mens, reaching generally to the calf of their legs. Over their drawers they wear a short petticoat, and they put bracelets upon their legs

and arms, with very large rings in their ears. They have very fine faces, and some of them most beautiful skins, which we sometimes had an opportunity of seeing; and although a man may live a whole year in Tetuan, and not see a woman in the streets, yet, when we meet them in the fields, or see them on the house-tops, if none of the Moors is in sight, they would unveil, laugh, and give loose to a few airs, till the appearance of one obliged them again to veil.

The custom of not letting their women be seen, prevails to such a degree, that when a man wants a wife, either his mother, or some other female relation, must go a courting for him. When the bargain is made, which is always before the *cadi* or justice, the bride is to keep within for eight days, her friends coming to rejoice with her every day. A *talib* or priest also visits her, and gives her instructions how she is to behave in the marriage state. In the mean time the bridegroom is visited by his relations, who all treat him in the same manner.

On the last day, the bride is put into a sort of cage, covered with a fine linen cloth, and carried on mens shoulders to the house of her intended spouse, preceded by her relations, and a band of music. Her brother, if she has one, leads her into the house, where a room is appointed for her and the women, and the man remains in his room with his friends. When the evening approaches, the two poor confined birds are let loose by the company, and the bridegroom goes to his wife's apartment, where he finds her alone, sitting on a cushion of silk, velvet, or such other thing as the nature of their circumstances will afford. Before her is a little table, about a foot high, with two wax candles upon it. Upon her head she has a black silk scarf, tied in a knot, the ends hanging down behind. Her shift is made with long sleeves like the mens, and long enough to hang behind her like a train. Her vest is of silk or velvet, buttoned close to her hands, and all over the breast. She has the same linen drawers we have already described in the women's dress, and collars of pearl or fine stones, and sometimes of lions or eagles claws, tipped with silver. In her ears she has great rings of gold or silver, and the same about her wrists and ankles, sometimes set with rich stones. Her slippers have thick soles made of cork covered with gilt leather, and edged with the same, which is a mark of very great distinction among them; for only the emperor and the *baschas*, with the principal people, are permitted to wear them, except on wedding days.

The cheeks of brides are painted red, and their eye-brows are tinged with black, and continued quite round their temples, like a pair of whiskers. They also make some small black spots, in imitation of patches, near to their noses and lips, a black spot on the end of their nose, and a black stroke, the end of which is drawn from their chin, and reaches down below the pit of their stomach, and sometimes lower.

They paint their eye-lids with a sort of powder, which they call *Alcohol*, putting some of the same into their eyes with a little stick, and the palms of their hands are all blacked. From the top of their thumbs, round the fleshy part, is a black stroke, and one from the end of each finger to the palm. Their nails are dyed yellow; and they have many fine streaks of black on the top of their feet, their toes being also dyed yellow.

Thus beautified, the bride sits behind the table already mentioned, with two wax candles placed upon it, holding her hands up to her face, with the palms turned towards her, about a foot distant from each other, and as much from her face; and she is to look upon her hands, but not upon her husband, who is to seize her when he comes into the room. He then lifts her upon the common bed-place, which is about four feet high; and then he strips her, she not lending him the least assistance. The marriage being consummated, the bridegroom gives his wife's drawers to a black woman, who waits at the door, and she hands them round to the relations.

All the women paint after the method already de-

scribed, especially when they go on visits, or when they are to be married. They are extremely handsome, and bred up with the greatest care imaginable with regard to their modesty. Those who are the most corpulent are the most admired; for which reason, previous to their marriages, they eat a sort of food called *lum-mith*, being a compound of flour, honey, and spices, made into little loaves for that purpose.

Adultery is punished with death; and if a Christian or a Jew is found to have seduced a Moorish woman, they must either embrace the Mahometan religion, or be burnt alive. Any man may divorce his wife if she was not given him by the emperor, but he is obliged to return her the marriage portion, and take care of such children as she bore him. The form is, only to deliver her a letter, telling her, that he has no more occasion for her, and that she may look out for another husband. Those who desire to indulge themselves with a great many wives, marry the handsome daughters of poor men, by which they avoid the very great inconvenience of drawing on themselves the ill-will of powerful relations in case of differences, so that they get quit of them without much trouble or expense.

Several Moors, whose wives or daughters were sick while we were there, came to our physician for advice; but some of them were so infatuated with superstition, that they let them die rather than trust the physician along with them; others consented, but not till they were at the point of death, so that it was too late to do them any good. There was only one exception, in a man who had more sense than the rest, for he took the doctor home to his wife, and she soon recovered of her disorder.

They, as well as all other Mahometans, are allowed to marry as many wives as they can keep, and also as many women as they are able to support, according to their rank in life.

All their women strive who shall please their lord and master, that they may enjoy his favours as often as he can possibly bestow them; for they are kept in great subjection, and think they are extremely happy if they can please their husbands by waiting on them. They are not suffered to go to the mosques, lest the devotions of the men should be interrupted with their presence, but they have a set form of devotion which they perform at home.

When any of these Moors have a mind to entertain their neighbours, the women go to the top of the house, and continue there till the guests are gone. Their general entertainments are with what they call *cusiusia*, which will be described afterwards. They make use neither of tables nor chairs, but sit cross-legged upon the ground, putting their dishes upon a large piece of greasy leather, which serves both for table and table-cloth. Their dishes are either of pewter or earthen-ware, made wide at the top, and narrow at the bottom, almost like a high-crowned hat, turned with the bottom upwards.

While they eat, a servant stands by with a great bowl of water in one hand, and a long slender piece of linen in the other, to wipe their right hands, with which they pull the victuals in pieces, being for the most part stewed to rags. They never use the left hand in eating, that being considered as dishonourable, and they fill their bellies without speaking to each other. After meals they drink water, wine being forbidden by their religion, and all other intoxicating liquors, except cyder. However, notwithstanding this prohibition, many of them get drunk with strong liquors of any kind, if they can only procure them. Their chief desert is butter-milk, of which they are such lovers, that when they would describe the extraordinary sweetness of any thing, they compare it to butter-milk. The reason seems to be this: the country is extremely hot, and butter-milk is not only cooling and refreshing, but likewise of great service towards supporting the spirits under any lethargic disorders. A great black pitcher of this butter-milk is generally brought in, with a wooden ladle, which is presented

presented to the most considerable person, and from him passes round the company several times.

They have no way of making cream as in other places, but make their butter of the milk as it comes from the cow, by putting it into a skin, and shaking it till it becomes butter. It is always sour, because the skin is not cleansed, and when made into sauce, having no substance in itself, it turns thin. Those that have great quantities keep it in holes in the ground, plastered within. The lefs are kept in earthen jars, buried under ground, to prevent it from moulding; but still there is something more than common practice in this, for it seems to have been derived from very high antiquity. Some of this butter they keep till it is several years old, for the people have very vicious tastes. They also wrap up the cauls, suet, and fat, of every sheep and goat in great rolls, which in winter is sold to the poor instead of butter; but it is of a most disagreeable nature, and no person would eat of it except compelled thereto by the utmost necessity.

Their cheese is nothing but curd, put into that form, and it is four in five or six hours after it is made, but they keep it till it is old, and eat it although it is very ill tasted. They do not esteem cows milk so much as they do that of goats or camels, especially the latter, which they look upon as extremely nourishing. Their bread is both cheap and good, especially that made of the flour that grows in Fez, it being renowned for its whiteness. It is baked in cakes of near a foot diameter, and an inch and a half thick, and it is to be had every day hot, and in that condition it is most esteemed. The whole is sold by weight, and the baker is severely punished if he commits an act of injustice. The poor eat a sort of coarse bread, which is made of corn called a third crop, and is a mixture of several coarse grains, that resemble feeds more than corn, and is such as their fowls feed on.

They cut the throats of all the creatures they eat, having first turned their faces towards Mecca, in order to obtain a blessing from the prophet Mahomet. While they turn the head of a beast towards Mecca, they call upon the name of God, and then wash the mangled quarters of the body in cold water, to cleanse it from all impurities. The next part of the ceremony is, to add to the quarters a large quantity of onions, and other sorts of roots, with which the country abounds in great plenty.

When the women visit one another, they leave their slippers at the door of the room, to give notice that a stranger is there, during which time the men refrain from going into the apartments of their wives and daughters, they being extremely punctual in observing all sorts of ceremonies relating to the females. We have something like this in England, where the first peer of the realm is not permitted to come into his wife's apartment without first knocking at the door.

The Moors, in consequence of a religious institution, often wash themselves, and they always bathe five times a day. In common, they only wash their hands and heads; but if they have touched any thing that is believed to convey pollution, then they are obliged to wash themselves all over, lest they should profane the temple during their devotions. There is something in this which has a strong connection with found policy, for were not these people to keep themselves extremely clean, a contagious infection would take place.

They are forbid playing at any games for money, and those who break this law are punished by fines or imprisonment. They sometimes divert themselves at draughts or chess, but in general are not much addicted to gaming, nor do they pay much regard to study or reading. Indeed these people are so effeminate, that almost all the powers of their rational faculties are enervated; and except in the company of their women, or in acts of voluptuousness, they have no notion of pleasure, so that we may justly say, they know no pleasure at all.

They have the most violent hatred that can be

imagined against the Christians, and they look upon them as more odious than the Jews, because the Christians eat swines flesh, and are not circumcised. When a poor man falls out with his ass, the first name he calls him by is that of a cuckold; then he calls him the son of a Jew; but when the beast continues to be refractory, they call him the son of a Christian, which is the most reproachful epithet they can bestow. Nay, they seldom mention the name of a Christian, but they say, God confound him, or God damn his father and mother; and, what is more shocking than any thing we have hitherto mentioned, these imprecations are taught the children as soon as they can speak: and that these children may grow up in a hatred against the Christians, they celebrate a festival every year about St. John's day, in memory of some of their victories obtained during the croisades. During the time of this festival, it is common to see the aged people walking round the streets with wooden horses, swords, lances, and drums; and the children being brought together, they are taught to say, "Thus we destroy the Christians." They also believe that those who die fighting against them go straight to heaven, and they deserve no less than infinite reward for destroying those enemies of their law.

The shops in this city are very small, and have no doors to them; but the master having opened the shutters, jumps in, and sits cross-legged upon a place in the form of a counter. The goods are disposed in drawers round about him, which he can reach, for the most part, without moving out of his place, for the customers stand in the streets while they are served.

In their houses they are always found sitting on mats, or lying on the floor; and if they go out on horseback, it is never farther than to make a visit, unless their business requires it. The truth is, they are very indolent, and sit frequently five or six hours before their doors on benches without any exercise whatever. When they are asked, why they do not walk from one room to another? their answer is, Why should a man walk from one room to another without apparent cause? Can he not as well stay in the place he is in, rather than to go to the other end, purely to come back again?

They do not divide their time as we do, for as the heat of the climate frequently deprives them of rest in the night, so they often get up in the night, and go to their prayers in their mosques; for which purpose, proclamation is made from the tops of the mosques to call them to prayers; and this is done every three hours, because they have no bells. When they come into the mosque, they repeat the first chapter of the alcoran standing, after which they look up, and lift their hands as much above their heads as they can. And as their hands are leisurely coming down again, drop on their knees, with their faces towards the east. Then touching the ground twice with their foreheads, they sit a little while on their heels, muttering a few words, and rise up again. This they repeat two or three times, after which, looking on each other, they say, "Peace be with you."

All their mosques have mats spread along the floor, and there are fountains at the doors. Their way of building them is very irregular, for they are generally surrounded with houses, which is not only a deformity, but likewise an indecency, when we consider that the people who bathe themselves must be exposed to public view. This practice is very different from what is commonly observed in Turkey in Asia, because in that country no person can approach towards their mosques to see them bathe, unless they are of the same religion with themselves, and then they being acquainted with their own customs, no offence can take place.

Their mosques are square and low roofed, supported by many arched pillars, and divided equally into aisles about four yards broad: against one of the pillars, as near the church as can conveniently be, is a pulpit, in which they preach every Friday; but such

as are not learned in the law only stay till the prayers are over, and then they return. That which they call the head of the edifice is a sort of cupola fronting the East, in memory of the place where Mahomet was born: into this, on their festival days, the *cadi* or justice of the peace enters, and, turning his face eastward, prays, all the people kneeling behind him in the mosque; then he turns himself to the people, being still in the same posture, and gives them a blessing; but if there is not a *cadi* present, it is performed by one of the priests.

The steeple or cupola stands indifferently in any part of the edifice or mosque, and in some towns there are a great many chapels and religious houses, but these are not under proper rules; sometimes they pray in the fields, at the monuments of their ancestors, repeating a certain number of collects as they turn over their beads, saying at every one they touch, "God preserve me."

Sunday is the same with them as it is with us; and they have prophecy, that on that day their empire is to be subverted, and their government overturned, by the Christians; for which reason, when the priests call from the tops of the mosques, the gates of all the walled towers are carefully shut, and the same is observed in the emperor's palace at Mequinez.

The habits of the priests are the same with the laity, but they are known by their beards, which are dyed red, and the leather on the top of their sleeves is cut in the form of a flower-de-luce. When a person dies, women are hired to make hideous outcries, and mourn as if they were in real earnest, that is, as if they had some connection with the party deceased, whereas it is all a farce, and such as no sensible man would ever give any countenance to. If it is a man, then all his wives get into the middle of the house, put ashes on their heads, sing about the dead body in a ring, and squall like so many cats, all the time tearing their cheeks with their nails: some, when they lament over the dead, ask them whether they wanted any thing in this world; whether they had not in it plenty of victuals. But when the wife dies, the husband receives the condolence and visits of his friends at his door; and if he be of the middle rank, it is no shame for him, even on the day of her death, to go abroad and provide for her funeral: they wash the corpse and wrap it in a new shroud, and then carry it on a bier to the place of interment, accompanied by a vast concourse of people.

They always bury their deceased out of town, making the grave large at the bottom, that the corpse may have room enough; and they never put two persons in a grave, lest their bones should be mistaken at the day of judgment: this however is only a vulgar notion among the people, for their doctors have more elevated notions. Nay, we are assured by Mr. Hanway, that in 1743, when he was in Persia, he conversed with a Mahometan priest concerning the resurrection of the body, and the latter had the same notion concerning it as Christians. It may be objected indeed, that the Mahometans in Morocco may have different notions from those in Persia, but this is a vain and trifling plea; for excepting a few ceremonies, of little consequence, the Mahometan religion is the same in all ages and nations.

They are extremely fond of fine tombs, which are generally built in the form of cupola's, with an entrance as wide as the building: they are of different forms; some are low pyramids, and others are square, and the body is generally deposited in the middle; but there is no fixed rule, nor are any of them confined down to the form of a particular structure.

The ordinary way of burying is by digging about three feet into the ground, into which they put the bodies wrapt up in the shrouds; for they use no coffins, but pave the grave over with stones. And perhaps it may not be improper to mention, that Mr. Cooke, who died in 1754, desired to be buried in this manner, at Morden College near Blackheath. Mr. Cooke had resided several years in Barbary; and when he advanced to old age, he conceived or rather harboured suspicions that all those who profess the gospel are hypocrites, and

he was led into this by his wife's conduct, who was to all intents and purposes priest-ridden.

It is certain, that they must have but very confined notions concerning the immortality of the soul, because they believe that departed souls can suffer; but do not Christians believe the same? Yes; without knowing what it means: but this has little to do with the nature of our present narrative; the truth is this, we must either believe the resurrection of the body, or we must believe no resurrection at all; and it is much to be lamented that the Portuguese and Spaniards, with whom these people have been long connected, so far from teaching them any thing of real knowledge, have left them in the same state of ignorance they were in when they were first discovered. They have the same notions concerning idiots as were embraced by the Turks, for they reverence them as saints and the chosen of God. For this reason all these fools are led about the streets, while the people keep kissing their garments, as if they had in them something sacred: they hold out to them every thing but money, which is reckoned too impure for them to touch, so that they must not take it. When they die, sumptuous monuments are erected to their memory, and these tombs, though many in number, are visited from motives of devotion. It is certain that the Mahometan religion does not permit people to worship saints or images, and yet this of visiting the tombs of the deceased deserves no better a name than idolatry.

It is difficult to lay down a general rule by which to know who are reckoned saints, or how they became so; but any thing extraordinary makes one: some are saints by descent, others on account of some particular qualities, many for being fools or madmen, and some for being most abandoned villains. Thus it happened, that one of the emperor's guards having stolen something, his Moorish majesty was just going to kill him, but on mediation he forgave him; and the people believed he was a saint, because the emperor had not power to kill him. Several of the emperor's horses have been made saints, and one of them was so much in repute while we were there, that a man having committed murder was pardoned if he could touch it. This horse was sumptuously fed with cuscusa; and it was a great favour to permit a courtier to drink out of the same bowl with the emperor and his horse.

Every thing, even the most horrid crimes, may be committed with impunity by the saints, because they are supposed to act from a divine impulse: they may steal, murder, ravish, or do what they please. There was a naked one at Sallee while we were there, who seized a young woman in the streets; and she, not well knowing the nature of that sanctification, began to treat his faintship a little roughly, but some other saints coming up they soon overcame the girl, and after gratifying their brutal appetites left her almost dead.

There was another saint at Mecassan who was a great huntsman, and the people thought it an honour if at any time they could steal dogs for his amusement: but their saints, like some of ours in Europe, are frequently detected. One of them had acquired a great reputation for sanctity in practising a trick taught him by a Jew, which was, to dip his alhague in spirits of wine, and when he went into the mosque he used to set it on fire by the lamp: this procured him great reputation, and he was sent for to court, became great, and lived to do the poor Jew an ill office. However the Jew was even with him, for he told the secret to the emperor, who put his holiness to the trial of more substantial fire, for he ordered him to be burnt alive.

There was likewise another saint undone by a Jew in the following manner: the saint pretended that he went in a miraculous manner every day to Mecca, and the Jew, who knew him to be an impostor, shewed him a fine string of beads, and afterwards shewed them to the emperor, who was to ask the saint to bring him a string of beads from Mecca. The saint returned to the Jew, got the beads, and went to the emperor with them as a present he had brought from Mecca: the emperor told him, that it must have been very fatiguing

for him to go so often to Mecca, and therefore that he might not have that trouble for the future, he ordered his head to be cut off, and his body thrown to the dogs. And here we would ask any serious person whether such a knavish trick practised by a Mahometan was not sufficient to make the emperor an infidel? that is, to make him believe that there was no truth in any religion whatever? undoubtedly it did. The best men in Roman Catholic countries are all deists; and why? because they know that the priests are constantly imposing on them. It is just the same in protestant countries; for were there no wicked clergymen, there would be no deists.

We heard so many reports concerning the tricks practised by the saints, that we doubted the truth of some; but the following, as well as many others we could mention, may be depended on.

A Christian making a voyage to sea intrusted a faint with a purse of gold, and at his return went to demand it; the faint denied he ever had such a thing, and the Christian made his complaint to a *cadi*, who told him that had he been a Moor he must have been satisfied with the faint's having denied it, but being a Christian, all the justice he could have was, that he should go into the great mosque, and swear to the truth. The poor man told the judge, that being a Christian he could not go into the mosque, but desired that the oath might be administered in the place where he sat to do justice. The *cadi*, being a man of wit and discernment, thought that the poor Christian looked for justice, so that his request was granted: the faint came first and sat down in the porch, and when the *cadi* or judge heard of it, he invited him into his house, and treated him in the most familiar and friendly manner.

After amusing him with discourses upon several subjects, he, to get his beads into his hands, stole out of the room, and sent them to his wife, as a token she should send a certain person with so much money, which accordingly came. This being sufficient conviction, the *cadi* ordered all the goods belonging to the faint to be seized, and sent him and his family to seek shelter on the mountains.

If a city happens to be founded near the tomb of a faint, there is a shrine round about it, that has the privilege of being a sanctuary for all sorts of criminals. But this is conditional, for the emperor never considers it as a crime to take an offender out of it, and strangle him with a bow-string. One time a Moor having committed some very trifling crime, the emperor sent an army of his guards to bring him out of the sanctuary; but the saints who resided at the place refused to deliver up the culprit. This exasperated the emperor so much, that he ordered the officers to be put to death; but at last the criminal was delivered up, and hanged along with half a score of the saints.

They are mightily addicted to superstition, relating very wonderful things of their saints, and among the rest their extravagancies. They believe some people have a malignancy in their eye, by which they hurt all things they look on, especially little children and fine horses. One day a *cadi* at Tangier having gone a fishing, and not succeeding in his diversion according to his wish, he seized a poor innocent man, who stood looking on, and accused him of witchcraft. The poor creature was committed to prison, and all his goods were sold before he could obtain his liberty.

They have another extravagant notion, which is, that God will grant their requests if they are very importunate; and thus it happens that in times of rain, the children will be all day running through the streets, calling for fair weather; and in drought, for rain. This they do with an hideous noise, sometimes for eight days together. This is the first effort, but if God does not comply with the requests of the children, the servants and learned men go into the fields, and beg for rain. If that solemn experiment does not succeed, then they all go together barefooted, and meanly clothed, to the tombs of the saints, where

they request rain; and sometimes the emperor performs this piece of devotion himself. But if all these experiments fail, then they turn the Jews out of the town, and bid them not return without rain; for they say, "That though God would not give them rain for their prayers, yet he will grant that favour to the Jews, to be rid of their importunity, their stinking breath, and sweaty feet." This happened once while we were in Africa.

They have a great many schools there, where the children learn to read, write, cypher, and get the alcoran by heart, which when they have gone through, their relations borrow a fine horse and furniture, and carry them about the town in procession, with the book in their hands, the rest of their companions following, and all sorts of music peculiar to the country going before.

Such as apply themselves to the study of their law, are admitted to hear public reading and preaching in their mosques, by their priests, and when approved of by them, are admitted into the number. They are examined by the priests, and if approved of by a majority, are admitted without much ceremony; for the oldest priest touches the beard of the candidate with one hand, and with the other gives him the right hand of fellowship. This is much the same as is practised among the Roman catholics, and even among some protestants; for superstition has no end.

The Moors, when they meet, salute one another, by joining their hands with a quick motion, and separating them immediately, each kissing his own hand, if they are equal in rank, but if not, the inferior kisses the superior's hand, and sometimes his head too. If it be a *cadi*, or judge, they kiss his foot, if on horseback; if on foot, his head cloaths, or any thing they can lay hold of; and all this is done in the most reverential manner, kneeling.

The current coin of this country consists of gold, silver, and copper; and their gold ducats are thin round pieces, stamped with the emperor's name; but they pass for much more than their value. The *blanhill* is a little round piece of silver, stamped also with the emperor's name, and worth about two-pence of our money. The *fluce* is a small copper coin, twenty-four of which go for a *blanhill*, so that their lowest piece of money is equal to the third of a farthing; and yet things are so reasonable here, that two or three of them will purchase a loaf of bread.

One may purchase a fowl for a *blanhill*, and every thing else in proportion, the whole country yielding all the most desirable necessaries of life.

The *basha*, Hamet Ben Ally Ben Abdullah, who treated us with so much kindness, was between forty and fifty years of age, a strong built man, inclining to be fat, but active and dextrous in all manly exercises. His countenance was grave and majestic, having a Roman nose, good eyes, and a well featured face. His skin was a little swarthy, but upon the whole, his appearance was majestic. The dominions he presided over are very extensive, reaching from Oran, which separates the emperor of Morocco's territories from those of the Algerines, and reaches westward to Morocco on the ocean, and from the Mediterranean on the north, as far as the river Cehu on the south. It is reckoned as large as the whole kingdom of Portugal, and contains many fine cities, being those we have already mentioned.

Sunday, June 13, we began our journey to Mequinez, leaving Tetuan about five o'clock in the afternoon, and a little after six, encamped on a very pleasant plain, by the side of a small river, about six miles from Tetuan. Here Ben Hattar lay encamped with his retinue, having left the town before in order to prepare himself for his journey.

The fourteenth, we decamped about four in the afternoon, and travelled on three miles, when we again pitched our tents, at a place called Dorzerbork, from a Moorish saint of that name, whose body lies buried there. These two short journies were undertaken to join the disposition of our camp, and see if

any thing more was wanting before we proceeded further.

The fifteenth, at three in the afternoon, we left this place, and travelled over a rocky mountainous country, so rugged, that it was difficult to get along. We travelled, however, no less than eighteen miles from our former camp, and pitched our tents about seven in the evening.

The sixteenth, we set out about six in the morning, the trumpet sounding to horse, which, for the present, was to be the signal for getting up; after which, it was expected every one would be ready in half an hour. We now began to feel the weather extremely hot, as may be imagined from the climate and season of the year, which daily increased, as well by getting more within land from the sea, as the days being then at the longest. Having travelled twelve miles, we came to our camp, where we pitched our tents on the banks of a small river, called Aleharob.

The seventeenth, we set out at six in the morning, and about ten encamped on the banks of a pleasant river, about fifteen miles from where we had been the evening before. In our journey this day, an old man, named Ben Sidi Hamet, came to us; he was related to one of the emperor's women, and one of the officers who are appointed to take care of the flying parties of Arabs, many of whom frequently passed us.

These Arabs seem to live very miserably, having but very indifferent lodgings, their houses consisting of nothing but skins, with a rush or cloth covering, in imitation of a tent, moving from place to place, for the conveniency of pasture and water. These, however, are generally built in a circular form, like a ring, by placing one row of houses close together, and going round with them till they meet, leaving a large vacant space in the inside. In the middle of the inclosure stands a house for the reception of the magistrate, who acts under the basha of the province; and this officer is always chosen by the Arabs themselves. These Arabs are, for the most part, very tawny, live nastily with their cattle and poultry, and their young children run about naked. They have abundance of fine black cattle, which, probably, is the greatest part of their substance.

But notwithstanding the seeming poverty of these people, a considerable revenue is drawn from them; for in the plains of Fez alone they reckon that there are no less than three hundred thousand of them, who pay the tenth part of all they have; to which they are liable as soon as they come to be fifteen years of age. This is the tax demanded by the law, but the collectors, and other magistrates, are so far from being satisfied with it, that they omit no manner of injustice and rapine, to fleece the people of all they can.

When these Arabs intend to remove from one place to another, they load their camels, bulls, and cows, upon whom they put pack saddles, setting their wives and children on them, in large wicker baskets covered with cloth, to keep out the heat of the sun; and in this manner they roam about till they can find a place to their mind.

At night we had large quantities of provisions brought us by the Moors, particularly cuscufu, which is their common food. This food is made up in the following manner:

They put fine flour into a large flat pan, and sprinkling it with water, take great pains to roll it up into small balls, which they separate and put into another vessel, as soon as they become of the size they would have them. When they have made a sufficient quantity of these, they put them into a cullender, which serves for the cover of a pot, where there is meat and fowls stewing, so that it receives the heat and steam thereof. When it is done enough, they pour strong broth into it, and putting the stewed meat and fowls at the top, serve it up. They imagined we had strong stomachs, for they sent in such a monstrous large vessel, made of wood, that eight Moors could hardly

place it on the table. We attacked it as vigorously as we could, but made such an indifferent progress, that it was hardly to be perceived we had eaten; but we had the pleasure soon after to see it emptied by the Moors, who attended us in order to drive our mules.

The eighteenth, we decamped between five and six in the morning, and passed the river Elmahassen, famous for the battle fought between Don Sebastian, king of Portugal, and the Moors. As wit, and an exuberance of fancy, leads men of learning and ingenuity to give us fable instead of history, so we find that the celebrated Sir Richard Steele laid hold of this circumstance, in order to aggrandize the victories of Muley Moluc, at that time king of Morocco. This induced us to enquire what historical accounts they had of this memorable event, but found only a traditional story, in which most of them agreed, though differing much from what is related by Sir Richard Steele.

Sir Richard attributes all the merit of this victory to the Moorish king, whereas the tradition in the country flatly contradicts it. They say, that Muley was a prince very much beloved by his people, but at that time labouring under the infirmities of old age, he was obliged to be carried in a litter; and when he came to Alcuffar, about six miles distant from where the battle was fought, he there died; upon which a slave of his, named Mirwan, whom the Moors speak of with great respect to this day, wisely considering the necessity of keeping secret the death of a prince so much beloved by his subjects, at a time when the two armies expected every day to join in battle, contrived it so as to give out orders for the king, as if he had been alive; making the officers of the army believe he was much better than he had been for some time before.

This animated the soldiers to fight, and as soon as the battle was over, the slave congratulated the new successor; but, instead of being rewarded according to his merits, he was actually put to death. The king of Portugal was killed, but so infatuated were his soldiers, that they would not believe it. They ran about like madmen, asking for their king, which gave the Moors an opportunity of cutting the throats of upwards of two thousand of them, which was done with a great deal of pleasure, because the Portuguese had murdered many of the Moors in the inquisition.

When we came towards Alcuffar, we were met by the governor of Tangier, who came towards us with a spear carried upright at his horse's head, by which ceremony all their governors are distinguished; and when they encamp, it is stuck before the doors of their tents. He was a handsome young man, and very like the basha in the face. Over his alhague he wore a scarlet albornoce, fringed with green silk, which made a fine appearance. After he had welcomed the ambassador, all his attendants walked round in procession, till we came up to the basha, who was coming to receive us; and the whole people of their town, who had horses, joined in the cavalcade. Here we had the pleasure of seeing a great many lusty young Moors gracefully mounted on fine horses, who shewed themselves no strangers to riding. This evening, having travelled sixteen miles, we encamped under the walls of Alcuffar, being much fatigued with the heat.

Upon the left of the road from Tetuan to Alcuffar, there runs a ridge of exceeding lofty mountains, called by the Moors the mountains of Habib. The inhabitants of these mountains cannot be reduced to any state of subjection like the rest of the country; yet, when they are treated civilly, they will bring the basha a contribution. When force is used, they seek revenge, and commit robberies on the innocent travellers; and whenever a party is sent out against them, they take shelter in the mountains, where the basha finds it too difficult to attack them, so that he rather chuses to take what they please to give of their own accord, than to use force, which he knows would have no effect.

Alcassar was once a city of good note, and the seat of the governor of this part of the kingdom. It was built by Jacob Almanfer, king of Fez, towards the latter end of the twelfth century, and designed for a magazine and a place of rendezvous for his army. It is said by some historians, that the father of this prince invaded Spain with three hundred thousand men, most of whom he was obliged to bring back soon afterwards into Africa, to put an end to a rebellion that had broken out in the kingdom of Morocco; after which this prince again entered Spain, having in his army, according to tradition, not less than two hundred thousand horse, and three hundred thousand foot. When we read the accounts of such amazing numbers of men being brought at one time into the field, we should do it with a great deal of caution; and yet, because no such circumstance takes place in our times, we ought not to be too hasty in our correcting the historian. The people in those ages and nations had very little employment at home, so that it is no wonder such multitudes of them should go abroad in order to acquire new settlements.

But then there is an objection arises, how could half a million of men procure subsistence, supposing it could be admitted, that two hundred thousand persons could have been brought from Africa to Spain?

To this it is answered, that as for the procuring of subsistence, it was not difficult, because in the gradual progress of their conquests they cultivated the lands, and lived some years before they completed the conquests. As for the horses in such numbers crossing the Mediterranean, we may doubt of it, but still ancient accounts ought not to be too hastily censured.

It is difficult to know the truth of ancient history, and rational conclusions must supply the want of positive evidence. The strongest objection against this part of the history, is, that of the horses being two hundred thousand in number, and this objection we acknowledge to be strong indeed; but then it should be considered, that this embarkation was said to have been near the Gut of Gibraltar, where the passage is very narrow; and as there is no time mentioned for the embarkation, so consequently it might probably have taken up two or three months, the small vessels returning daily to bring over other horses.

This city is so much fallen to decay, that though it had formerly no less than fifteen mosques, it has now no more than two. This is ascribed to the bad situation of the place, being situated so low, that it was excessively hot in summer, and almost drowned in winter. Superstition also has been its enemy, for it was cursed by one of their saints, who was cunning enough to tell that it should be burnt up with drought in summer, and drowned by rain in winter; and to make the people believe the validity of the prediction, the priests took care to set fire to some of the houses every summer.

Here are a great number of storks, who live very familiarly with the people, walking about the town, and possessing the tops of the houses and mosques without molestation, being esteemed a sacred bird. For this reason they account it a sin to disturb them; but many of these birds, not being permitted to go into houses, drop down dead every day through the violence of the heat. At present, the basha of Tetuan appoints he governor of this town, and it is the last of any note in his dominions towards Mequinez.

Monday 26. About four o'clock in the afternoon we left Alcassar, our number being very much eased, by having found the basha and his sixteen brothers, besides nephews, the whole family being ordered to court. About six in the evening, we encamped six miles from Alcassar, near the banks of a refreshing stream.

The twenty-seventh, we decamped about six in the morning, and about eleven came to the side of a small brook, where we pitched our tents, having travelled above sixteen miles.

The twenty-eighth, we sat out at three in the afternoon, and a little after six came to the river Cebu, about twelve

miles further, where we encamped. At this river end the dominions of the basha of Tetuan, and it is one of the largest in the whole kingdom. It takes its rise beyond the kingdom of Fez, and falling into the sea at Marinora, crosses and waters a very extensive country. Its water is reckoned extremely wholesome, and therefore it is much esteemed by the Moors.

The twenty-ninth, about half an hour after two in the morning we left the river Cebu, travelling by moon-light over the plains of Marmora, which is about twenty miles. This plain is very remarkable for its exceeding smoothness, stretching itself about eighty miles into the country, every part of it being as flat as a bowling-green. At eight we encamped at Sidi Cossim, a small town situated near the foot of the mountains that inclose this plain on the south. The town takes its name from a saint, who has a monument in it, to which the Moors, with great superstition, resort to say their prayers, and a great many more saints are buried in the road to Mequinez, having little mounts placed over them, which the Moors never pass without repeating some of their prayers. It is true they do not address themselves to those saints, in the same manner as is practised by the Roman Catholics; but their going there so frequently to celebrate their prayers, is one of the strongest marks and proofs of their idolatry that can be found in the world, or in human nature.

The basha coming into the camp just as the ambassador's tent was pitched; the latter invited him in, and the conversation was really entertaining, turning upon the vast tract of ground we had passed over, in which we had seen so few towns. The ambassador took notice that it was a pity so much ground should lie waste, which being cultivated, would enrich the emperor, and fill his granaries. The basha told him there was no want of corn in his master's dominions, he having many magazines always full; for the Moors can preserve corn upwards of a hundred years, by putting it into pits plastered within, and covering the mouth when they are full.

The thirtieth we continued still in our camp at Sidi Cossim, the basha staying for some of his collectors, who had orders to bring in their contributions, which were to be presented to the emperor. But we were obliged to keep our distance from this holy town, for superstition runs so high in favour of the saint, its godfather, that it would be a great profanation for any but Mahometan feet to tread near it; of which being told, we rather chose to suffer our curiosity to remain unsatisfied, than be insulted by superstitious Mahometans.

July 1. About half past five in the morning we departed from Sidi Cossim, and ascended a most dreadful rocky mountain, which at the top was so rugged, that it was with great difficulty we could get over it; and the descent was so steep and stony, that a little rain would make it impassable for horses. Between seven and eight we had a sight of Mequinez from the top of a hill, and the prospect was amazing. About ten we encamped in a plain called Muley Idris, from a saint, who has here a monument. This Muley Idris was the founder of the city of Fez, and the first Arabian prince who reigned in Barbary. He was made a saint for compelling a great number of Jews to turn Mahometans, and his tomb is to this day a sanctuary for all sorts of criminals. Nay, such is the esteem in which it is held, that all travellers who do not turn aside to visit it, are considered as no better than Christian dogs, the name by which they commonly call us; and the emperor often pays his devotions there.

There is a city that takes its name from the same saint, and stands almost close under the high mountain called Zarbon, which they say runs as far as the great Mount Atlas. About a league from this city, on a gentle rising hill, are some very ancient ruins, which the Moors call Pharaoh's Castle, who, they told us, was a Christian, but could not give any farther account of him. As the name Pharaoh is Egyptian, one would be apt to imagine that one of the kings of Egypt had

had penetrated into this part of Africa; but here we have no assistance from history to direct us. This day was so exceeding hot and sultry, that all our swords were so much heated by the sun, that when we came to our tents we could hardly touch them; and indeed we were so weak and languid, that we could scarcely eat any victuals.

The country we had hitherto passed is very pleasant and fertile, the plains in many places abounding with corn and cattle, and the mountains yielding plenty of olives, though a great part lies waste and uncultivated. This is not so much owing to the want of a sufficient number of inhabitants, as by reason of the oppression from the government, which makes them chuse to live at some distance from the great road, and seldom cultivate any more land than what they want for their own subsistence.

The ruins, called Pharaoh's Castle, stand about one hundred and forty miles south of Tetuan, and sixteen north-east of Mequinez. One of the buildings seems to have a triumphal arch, there being several broken stones, with inscriptions upon them, lying in the rubbish. The remains are fifty-six feet long, and fifteen broad, both sides being exactly alike, built with very hard stone.

There is another whole arch standing, twenty feet broad, and on it are a vast number of inscriptions.

About an hundred yards from the arch is the front of a large square building, one hundred and forty feet long, and about sixty high. Part of the four corners are yet standing, but little remains besides the front. There is, however, in it something grand and majestic.

Round the hill may be seen the foundation of a wall, about two miles in circumference, which inclosed these buildings, in the inside of which lie scattered all over a great many stones, of the same size as those the arch is built of, but hardly one is left upon another. As these ruins could never have been the work of barbarians, so we are naturally led to believe, that the Romans penetrated so far into Africa; for although we may not find the names of these places in their history, yet, when we consider the changes that have taken place, the revolutions that have happened, and the conquests that have been made in this part of the world, we need not be much surpris'd.

July 2. We left Muley Idris at half an hour after five in the afternoon, and upon the road heard that Ben Hattar, the Jew, who had gone to Mequinez two days before, had been very well received by the emperor. We mention this, because none of his subjects go before him without fear, imagining they will not return alive; so that when any considerable person has been admitted into his presence, and met with a favourable reception, it is usual to tell it immediately abroad, so that the news goes from one to another. Thus the account of Ben Hattar's reception was brought us many miles before we got to Mequinez, and published as a very favourable omen. About nine the same evening we encamped with the basha, within three miles of Mequinez, being determin'd to rest there all night, that we might be ready in the morning to make our public entry.

Monday 3. We set forward about four o'clock in the morning, the moon being up, and a little before sun-rise entered the city, to avoid the prodigious crowd we should have met with had the day been farther advanced, by which means we got to our house with very little interruption. The basha of Tetuan not having been at court for three years, he therefore this morning prepared to make his publick appearance before his sovereign. The basha had been accused of cowardice, in letting the Spaniards drive him out of his camp before Ceuta, so that he was in great danger of losing his life.

When he came into the emperor's presence, that monarch reprimanded him in very severe terms, and threatened to put him to death; but after he had sufficiently frightened him, he bid him go into the seraglio to visit a sister of his, who was one of the empe-

ror's women. This he did, to send him out of the way, till such time as he had vented his anger upon his followers; for some one had sent him a list of those about him who are his greatest favourites.

The first on this list happened to be one Larbo Shott, a man of some reputation, and ought to have met with a better fate than he did, which we shall take notice of afterwards. The next was one of the basha's secretaries, whom the emperor ordered to be tossed, which being a mode of punishment, different from any used in Europe, it may be proper to give some account of it.

The person whom the emperor orders to be punished in this manner, is seized upon by three or four strong negroes, who catching hold of his hands, throw him up with all their strength, and at the same time turning him round, pitch him down head foremost; at which they are so dextrous, by long usage, that they can either break his neck the first toss, dislodge a shoulder, or let him fall with less hurt. They continue doing this as long as the emperor pleases, so that the poor unhappy creature is often killed on the spot. Sometimes they come off with only being severely bruised; and the person that is tossed must not stir a single limb while the emperor is in sight, under the penalty of being tossed again, but is forced to lie as if he was dead, which if he really is, no one dare bury him till the emperor has given orders for that purpose.

July 5. The emperor sent one of his courtiers to inform the ambassador, that the house he lodged in belonging to the basha of Tetuan, was not good enough for him, and that he would have him go to a house of Ben Hattar's, that he had lately built, and was one of the best in Mequinez, and to this house we immediately removed.

Thursday, July 6. About seven o'clock in the morning, the emperor sent one of his officers with a guard to conduct the ambassador to the palace, and we passed through the streets in the following manner:

First, there went two serjeants on horseback, who were followed by our music, which played all the way. Then came the ambassador, with his attendants on each side, and after him the gentlemen of his retinue. These were followed by several servants on horseback; and after them came such English masters of ships as had been detained in captivity. The officers who commanded the guard would not suffer any of the Moors to come near us, except such as belonged to the emperor's palace. Thus when any of them, from motives of curiosity, came near us, the guards knocked them down.

Being arrived at the outer gate of the palace, we dismounted, and passing through three or four large court-yards, sat down under some piazzas for about half an hour. Then word being brought that the emperor was come out, we were led into a spacious hall, where at a little distance we saw him, with an umbrella over his head, his guards drawn up behind him in the form of a semi circle, holding the but-ends of their pieces with their right-hands, and keeping them close to their bodies, with the muzzles directly upwards.

His courtiers were on each side, bare-footed, and in the habit of slaves, who never stand exactly before him, but making a lane, watch the motion of his horse, that they may immediately fall into the same posture. Our music continued playing, as we approached still nearer the emperor, till we came within a hundred yards of him, when it was surpris'g to see the old monarch alight from his horse, and prostrate himself on the earth to pray. In that posture he continued some minutes, seemingly without the least sign of motion, with his face so close to the ground, that the dust remained on his nose when we came up to him. Then mounting his horse again, he took a lance in his hand, and Ben Hattar leading the ambassador up, we fell into one rank; and bowing as we approached the emperor, he nodded his head, saying *bono* several times, and bid the ambassador be covered, which he did, and at the same time delivered his majesty's letter, tied up

in a handkerchief, into the emperor's hand; for it is a rule never to deliver any thing into his naked hand.

He told the emperor he was come from the king of Great Britain, his master, to settle peace, friendship, and good understanding between the two crowns, and that he had brought him a present, which he hoped he would accept. The emperor replied, that he should have every thing he came for, because he loved the English, and that such of the Moors whom the ambassador had brought over with him, as were able, should pay their ransom; and those who were not, the basha of Tetuan should pay for them. But recollecting himself, he observed, that the English made no slaves nor sold any. Upon which the ambassador told him, he begged he would have regard for the king his master's subjects, and admit them to return home to their own country in a manner becoming so potent a monarch, and as may give convincing proof of the regard he had for the English nation; not that the nation stood in need of the men, for the English employed every year above one hundred thousand on the seas, but that the king his master was desirous, out of goodness to his people, that so many of his subjects may return again to see their wives and families.

Then the emperor speaking to the basha of Tetuan, the latter prostrated himself upon the earth, and kissed the ground at his horse's feet, which they all do when he talks to them, and go backwards to their places again.

The emperor was about eighty-seven years of age, but extremely active. He was of a middle size, and had the remains of a good face, with nothing of the complexion of a negro, although his mother was a black. He had a high nose, pretty long from the eyebrows downwards, but he had lost most of his teeth, and breathed through them, for his lungs were bad, having been afflicted with a most violent cold, which had continued upon him many years. His beard was thin and very white; his eyes seemed to have been sparkling, but their vigour was decayed through age, and his cheeks much sunk in. He was mounted upon a black horse, not so remarkable for beauty, as having been taught to please him. His negroes continually surround him, and beat the flies from his horse with cloths, and the umbrella was kept twirling over his head continually, the man that carried it taking care to move forward as the horse did, that no sun might come upon the emperor.

His dress was not much different from what his bashas wear when they are out of his presence, consisting of a fine alhague, and his turban was made of rolls of muslin, that came very low upon his forehead, the end of his scymetar hung out, and was covered with gold, and handsomely set with large diamonds. His saddle was covered with scarlet cloth, embroidered with gold, with one pistol in a cloth case on one side.

Parting from the emperor, which we did by going backward a considerable way, and Ben Hattar, by his orders, conducting us to see the palace, we were led into a large oblong square building, with piazzas on every side. The arches were wrought with plaister fret-work in flowers, after the Arabian manner, and supported by neat stone pillars. The square was exceeding large and spacious, and the bottom and sides, for about five feet, were chequered with small tiles of divers colours, about two inches square, of which small chequer work there was a prodigious quantity in the palace. All the apartments, walks, magazines, passages, and underneath the arches being chequered, made the prospect of the buildings, which are all of a great length, extremely magnificent, beautiful, and neat. From thence we were led into a magazine, near a quarter of a mile long, and not above thirty feet broad. In it were hung up a great quantity of arms in cases; and there were nine rows of rails, which were covered with saddles almost from one end to the other. And in another magazine, they shewed us the gates of Larach, which the emperor took from the Spaniards, with a great deal of other military articles.

Hence we were conducted into another large and spacious building, with piazzas all round like the former. In this square resided two of the emperor's wives, who were favourites, and in great esteem with him. We were not permitted to see any of them, for none dare attend them but their female slaves and eunuchs. This, however, is not in consequence of their being Mahometans, for it appears evident, from the convincing testimony of history, that jealousy, in consequence of polygamy, had been for time immemorial the practice of that country.

From thence we went through some long walks and passages of chequer work, and came to another large building, with a garden in the middle, planted round with tall cypress trees. The garden is sunk about sixty feet below the foundation of the building, over which, from one side to the other, there is a terrace walk, called by the Moors the *Stranee*, which is about half a mile long, and fifteen or sixteen feet broad. The top of it is all the way thick shaded with vines, and other greens, supported with strong and well made wooden work. In this walk there was a chariot that went with springs, and a small calash, in which they told us the emperor was often drawn by his women and eunuchs.

We passed hence through several other squares and large buildings, and then we saw the Christian captives on the tops of high walls, working and beating down the mortar with heavy pieces of wood, much like our pavours in England. This affected us considerably, but it gave us some pleasure to think that we were come to procure their liberty. Having spent about three hours in the palace, we were led again to the emperor, who was on horseback, at the entrance of a magazine, in which were great store of arms kept in order by some English slaves.

The emperor, at the approach of the ambassador, cried out *Bono, bono*, and asked him how he liked his palace? The ambassador said, it was one of the noblest on the face of the earth, and the emperor replied, *Thank God*. Then some of the English slaves fell prostrate, and giving him the usual salutation, *God bless thy power*, the emperor asked of what nation they were, who being told English, he bid them go home with the ambassador, and see him to bed. Upon which the ambassador returned the emperor thanks, took his leave, and went home to his house. At night, one of the queens sent some victuals dressed in the palace, and fruit, with a compliment to the ambassador, desiring to know how he did, and wished him a good night. The victuals were high seasoned, and strewed with roots and spices.

The seventh we were sent for again to see the palace, where arriving about nine o'clock in the morning, we were first led to some large rooms, full of men and boys at work, making saddles, stocks for guns, scabbards for scymetars, and other things. Upon sight of the ambassador, they all fell a working together, which made an agreeable sound, and shewed that industry was in great perfection in the emperor's palace. From thence we went through several large rooms, and then passing by gates guarded with eunuchs, who drove away all but those who were appointed to conduct us. We passed by a garden sunk very deep, having a great deal of clover in it for the horses of the palace. The building on one side was supported with neat piazzas, and the rails over which we viewed the garden were finely wrought, with steps to go up to them, which were chequered, as were the walls before them, so that upon the whole the palace had a most beautiful appearance. It was very difficult to persuade the emperor to have patience to hear what the ambassador had to say, being fond of speaking much himself, and interrupting the linguist so often, that it was extremely difficult for any one to give him a proper interpretation.

The ambassador having delivered the articles of peace, told the emperor that they were signed by the king, his master, and desired he would be pleased to sign a counter-part, to be carried to England. To
which

which the emperor said, that his word was as effectual as his writing, but however he would do this to satisfy him. Accordingly the articles were signed, and committed to the care of the high admiral, who was afterwards sent ambassador to England.

Having passed this building, we came to the most admired and beautiful part of the palace; which also has a garden in the middle, planted round with cypress and other trees. This building is of a great length, and all the pillars and arches of the doors are finely executed: these, they told us, had been done by the Romans, and brought hither from Salce: this will appear the more probable, when we consider that the Moors have but a most wretched taste for any thing in regular architecture; and whenever we met with any thing that seemed to have been the remains of antiquity, parts of them were so daubed over, as shewed in the clearest manner the gross ignorance of the people.

Here one of the queens sent us a collation of dates, grapes, figs, melons, almonds, raisins, and sweetmeats prepared by herself; making an apology at the same time, that she had nothing better, it being their ramadan, when they dress no victuals but at night. The fruit was very acceptable, for walking had made us dry; so we sat down under the piazzas, and were attended by the maids of the palace, whose jetty skins received the embellishments of shining bracelets, and silver trinkets, which they wore in great plenty upon their legs and arms, with gold chains about their necks, monstrous large ear-rings, and other ornaments consistent with the custom of the country. We were then in sight of the emperor's women, but they were so placed, that we knew nothing of it till afterwards.

The feast being ended, we parted from our black attendants, and were carried to another regular and neat building, with piazzas all around; the space between was all chequered, in the middle of which was a row of marble basons, at certain distances, with little channels cut in stone, conveying water from one to the other: underneath the arch there opened folding doors into large squares, or very lofty rooms and halls, in some of which were great numbers of fine works, regularly hung up; others had stores of lances of all sorts and sizes, and among the rest a Guinea lance, taken from an Indian prince, which was shewn as a great curiosity, having four spears at the top of it, and the shaft made of Brazil wood. In these magazines we saw a vast number of warlike instruments taken from the Spaniards, which are considered as great trophies of Moorish courage.

Passing by some rooms where the emperor's jewels were deposited, under the care of a black eunuch, who was his high treasurer, we came to the last, in which was a great number; a scymetar was handsomely disposed, and in very good order, with several swords among them that had formerly belonged to the Spaniards: and after we had seen a greater number of arms than we believed this prince was in possession of, we were led into the inside of an apartment where one of the queens formerly lived: here were several frames for beds put close together, in which it was said the emperor sometimes resided; and here were several very beautiful baths. It was told us that this queen was, in her life-time, a favourite; and therefore the emperor ordered, when she died, that none other of his women should ever reside in the same apartments, so that they were kept empty, and had been so for many years.

From thence we were carried through several other buildings, consisting for the most part of oblong squares and piazzas, under which the doors open into the lodgings, which generally are good rooms: the doors of each building are all of one size, and finely inlaid, some of them being gilt, and kept shut, so that we could not see into the apartments. In one of these squares was a fountain with channels of marble, that made a playing out very neat and pretty: we also passed by the place where, they told us, Mahomet's writings and the holy law were deposited; and then we

passed through several stately galleries, whose insides were faintly painted of a blue colour, with stars of gold, representing the heavens, and a golden sun in the middle of curious workmanship. In some of these galleries the emperor entertains ambassadors sent from christian provinces: some of them serve as magazines for arms, and in one of them was hung up a rich scone, which king George had sent over as a present to the emperor. As we were going away, they shewed us a massy building with high walls, without any monuments, in which the emperor had ordered that his bones should be deposited after his death.

From hence we went to take a prospect of the palace, and passed over a large field, where, on each side of the path-way, we saw a vast number of large rats that burrow in the earth like rabbits, and run about so thick that the ground was almost covered with them, letting us come within the distance of seven or eight yards before they would go into their holes, and having passed a little further they appeared above-ground again, so that both before and behind us we saw great multitudes of them. At the end of this field was a pomgranate garden, planted in a valley, over which the emperor has built a strong bridge, reaching from the top of one hill to the other; and for the more commodious passing over, at the end of the valley the bridge is formed by a causeway, with a wall on each side for about two or three miles, it being the road over which he passes to his stables.

The royal palace is about four miles in circumference, and stands upon even ground, in an almost square form, and no hill near to overlook it: it is built of rich mortar, without either brick or stone, except for pillars and arches; and the mortar is so well wrought, that the walls are like one entire piece of terrass: the whole building is exceeding massy, and the walls in every part very thick.

The inside of the palace consists in general of several fine oblong squares, some of them bigger than Lincoln's-Inn-Fields, in London; having piazzas all round, as before described: some of the squares are chequered throughout the whole space; others have gardens in the middle, that are sunk very deep, and planted round with very tall cypress trees; the top of which appearing above the rails, present a most beautiful prospect of a palace with gardens intermixed.

There are likewise dispersed throughout the palace several buildings called cobaks, and they are built square, with plain walls on the outsides, except the front, which consists of piazzas of five or six arches: the inside is one very large lofty room or hall, chequered at the bottom, and the sides almost the height of a man: the top, or device, is curiously painted, neatly gilt, and the roof is covered with green tiles, meeting up like a pyramid; so that perhaps no work of art can appear more beautiful while the sun-beams in summer reflect from it.

We were informed that thirty thousand men, and ten thousand mules, were employed every day in the building of this palace; which is not at all improbable, seeing it is built of hardly any thing but lime, and every wall worked with excessive labour. The nature of the building is convenient for the hot climate, being mostly ground rooms; by reason of which, and the great thickness of the walls, the lodgings are very cool and refreshing when the weather is excessively hot.

The emperor never parts with any money, either to defray the expences of war or buildings, and caused this magnificent structure to be erected without putting himself to any expence. The inferior officers, like some of our nobles in England, found slaves to carry on the work, and in recompence the emperor made them either bashas, or ordered them to some other high offices under his government.

This emperor was much addicted to building, but it is certain he had no taste; for it was a common proverb among the people, that he pulled down more structures than he built: nay, it was observed of him, that he seldom ever built a public structure but he soon after pulled it down; and from this circumstance

we are led to imagine that he had heard something of architecture, but had never learned those rules by which such a useful art should be conducted. This has been the case with many other great men, who having a smattering of knowledge, without being perfect in any thing, never made improvement.

There was, perhaps, never a prince in Morocco who made such a figure as this emperor. He succeeded to the crown on the death of his brother, in 1672; so that when we were there, he had reigned fifty-three years. His grandeur was owing to his courage and vivacity, together with the help he met with from the Jews, particularly Memoran their governor, who, on all occasions, supplied him with money to carry on the war against his opposers: for his nephew, Muley Hamet, then basha of Moravia, had got himself proclaimed king; and Muley Aram, his brother, likewise set up against him: but Muley Ishmael, the present emperor, who was at that time no more than governor of the province of Mequinez, raised what forces he could, and went with all expedition against his opposers, whom he conquered, took the city of Morocco, and reduced all that kingdom to his obedience, in 1676.

After the death of Muley Hamet, the cruelty of this emperor began to appear; the first scene of which was acted by the side of a river, to which he came with his army, but could not pass, so that he ordered all the prisoners to be killed, and their bodies to be thrown into the river, for his army to pass over instead of a bridge. In 1675, he made himself master of Tassilet, and nine years after that took Marmora from the Spaniards, where he found eighty-eight pieces of brass cannon, fifteen of iron, and more ammunition than he had in the whole of his dominions: he also took Larach from the Spaniards in 1689, clearing all the sea-coast of his territory. In 1701, he went to war with the dey of Algiers, but not succeeding in his enterprize, he was obliged to patch up a peace in the best manner he could; and this peace, in consequence of a variety of circumstances, has never been violated; the Mahometans paying much more regard to their promises than nominal Christians.

At the beginning of his reign, the roads were so much infested with robbers, that it was dangerous to stir out of the town without being well guarded, but he punished all such as were taken in such an exemplary manner, that when we were there every person might travel without the least fear of molestation. He conducted the government of all his provinces, which were indeed numerous, with so much prudence, that few irregularities happened, and when these took place they were soon suppressed. Extensive knowledge, and vast abilities, were requisite for such a mighty undertaking; and yet this emperor went through with it, leaving an example to those who think themselves more refined in the scale of human learning, to consider, that even Moors can set them an example.

In the empire of Morocco is contained all that country, called by the Romans Mauritania, with many other provinces, too tedious to mention: some of them reaching as far south as the cape of Blanco, where it is bordered by the negro country, as it is northerly by the Mediterranean sea: it has on the east the kingdom of Algiers, and part of the country of Beldulgarid, and on the west the main ocean. Over all these dominions he reigns with a most arbitrary sway, and his bashas have been brought into such a state of subjection, that none of them dare take up arms against him. All the disturbance he ever met with at home, was in consequence of the conduct of his son Muley Mahomet, who causing himself to be proclaimed king of Morocco, plagued him for some time; but being at last taken prisoner, the emperor ordered his right hand and left foot to be cut off; which is not much to be wondered at, when we consider that they have no surgeons in that part of the world.

This Muley Ishmael, of whom Mr. Addison has given such a shocking account in his *Freeholder*, was a man of knowledge, and antiently governed his people

according to the dictates of sound wisdom. He appointed deputies to rule over every one of his provinces, but they were all to be accountable to himself. At court he had always his standing officers for all things of a religious nature, and they were to be accountable to the grand Mufti: the chief eunuch was to take care of the seraglio; and there was a treasurer to inspect into his revenue. A person was appointed to superintend the buildings, and although he may know nothing of architecture, yet he was considered as a very great person at court. By these prudent methods justice was administered unto all ranks of people in the empire, and although it cannot be said that the emperor himself acted in consequence of his own despotic power, yet this was not considered as a hardship where the people were accustomed to such proceedings. Liberty commonly exists in a state of nature, and then it is only liberty to do evil. Civil government is slavery to the passions of men, but liberty is the aggregate sum of human society, and consistent with the interests of well regulated communities.

The governors of the provinces were ordered to court every two or three years, to give an account in what manner they have administered justice, and to answer such complaints as have been exhibited against them. The meaning is, they are, on such occasions, to bring the emperor all the money they can; for he never inquires in what manner they procure it, so that he can obtain it. Nay, so little regard do they pay to the conduct of these lieutenants, that let ten thousand murders be committed, the emperor never complains, if but his coffers are filled. By these means he gets little less than the whole of their wealth; and thus the people are kept in an abject state of slavery, in order to aggrandize the sovereign. This, however, is the case in all countries where the government is despotic, but in none more than in those where the heat of the climate, and the influence of the Mahometan religion, have contributed to render the subjects effeminate.

When these deputy governors return from their provinces, they look upon themselves as in the greatest jeopardy, for they know not but that the moment they enter the royal palace they may be put to death. For if it should happen that the emperor imagines they do not bring him the whole of the revenues, or supposes that they keep somewhat to themselves, then it is a thousand to one but they are put to death in the most cruel manner.

Before they go into his presence, they put on a particular habit, which denotes slavery, and they pull off their shoes; and when they approach him, they fall prostrate to the ground. If he speaks to them, they come forwards, and hold their heads on one side, in token of offering him their lives; which great degree of submission is occasioned partly by fear, and partly by superstition, for they believe him to be one of the real descendants of Mahomet. This induces them to consider him as highly honoured of heaven, and can do nothing amiss; so that here is something of an infallibility to be found, at least in pretension, within the bounds of the Mahometan religion.

Nay, this opinion was carried so far, that it became an established maxim, that whenever the emperor took it into his head to kill any person, the victim of his displeasure was to go immediately to Paradise. Supposing this doctrine to be true, Muley Ishmael, the emperor, of whom we have been writing, must have been a very holy man indeed; for it is computed that he murdered above thirty-six thousand of his subjects with his own hands.

The Moors, like the Mahometans in Turkey, observe a fast of one month, which they call ramadan; during which time they abstain from all sorts of food, till the appearance of the stars in the evening: neither are they allowed to smoke tobacco, wash their mouths, take snuff, smell perfume, or converse with their women. Those who are obliged to travel may drink a little water, and such as are sick may drink a glass of wine; but for this indulgence they must pay a most

exorbitant sum. In the towns they run about, and awaken all those people whom they imagine to be asleep, that they may eat, and so be the better able to support their strength through the day. They get up three or four times in the night, and as often go to bed again to sleep.

On the evening of that day on which the fast ends, a trumpet is sounded to give notice of it; before which time, it is pleasant to see the posture of the Moors; one holding a pipe ready filled, while he impatiently expects the sounding of the trumpet; another with a dish of victuals before him, ready to eat out of it, as soon as the law will permit. On the eve of this Lent, they make great rejoicings, shouting, and repeating the name of God, and watch for the appearance of the moon, at which they fire their muskets, and then begin to say their prayers. Sometimes the emperor assists on these occasions, who, to persuade the people of his great regard for religion, keeps this fast four months every year. In this, perhaps, the emperor is as great a knave as the pope, for under pretence of fasting, he only abstains from animal food, but at the same time feeds on all sorts of dainties.

This emperor, like all devotees, punished with the utmost severity those who transgressed against any precept in the alcoran, and he carried his hypocrisy so far, that he was looked upon as a really religious person. He attended to all the exterior duties of religion, and every person who neglected them, was put to death, though murderers were frequently pardoned, and sometimes rewarded. By these means, operating on the minds of superstitious people, it was no difficult matter for the emperor to keep his subjects in a proper state of subjection. The truth is, an hypocritical prince, when the people are ignorant, may be secure of reigning in peace, nay, in favour. For when actions are construed into virtues, and while he is mocking God by his dissimulation, he acquires the character of a man of piety. This was the case with several princes whom we could mention, but as it is rather foreign to the subject, we shall not insist any further on it, but proceed with our narrative.

Muley Ishmael, this emperor who had lived to so great an age, was no stranger to the art of preserving his health. He was always up early in the morning, and some of his subjects were bold enough to say, that he did so because of the horrors of his conscience, in having murdered many innocent people. Indeed this is probable enough, for it is not long since a Mahometan in England was afraid to sleep alone, upon the consideration that, in order to aggrandize his fortune and family, he had murdered upwards of thirty thousand persons in cool blood. It was much the same with this emperor; for he was waited on in his bed chamber, and whatever emotions of terror they beheld in him, they were obliged to conceal them, under pain of being put immediately to death. Some of these eunuchs and slaves were, notwithstanding this strict injunction, communicative enough to tell us, that his sleeps were very much disturbed, and his mind full of horror. When starting upon a sudden, he has been heard to call upon those whom he had murdered; and even sometimes, when he was awake, he asked for those whom he had murdered the day before; and if any of his slaves around him were dead, he immediately asked who had killed him. The answer he received from his slaves was, that they did not know, but they believed God had done it; for had they said he fell by the hands of the emperor, their names would soon have increased the number of the dead.

He had once a favourite, named Hameda, whom he put to death with his own hands; and the consideration of this made such a deep impression on his mind, that when he was walking alone, and supposed no one heard him, he frequently mentioned his name. This Hameda was the greatest favourite he ever had; he was the son of the guardian of the slaves, and came only a boy into the army of the emperor, during the time that Muley was carrying on the siege of Zerandant against his cousin. Hameda having shewn some-

thing of his military skill in this enterprize, the emperor took notice of him, and gave him a horse, which was a high mark of distinction. The young man, encouraged by the favour conferred upon him, soon endeared himself to the emperor; for he was extremely ready at singing a merry song, and mimicking a few of the tricks practised by buffoons. He was permitted to go into the emperor's garden, an honour to which none other had ever been admitted; and he had the title of basha conferred on him, which set him above all others who bore that name.

The emperor used to tell him that he could not be angry with him, and that it was impossible he could be provoked to kill him; and it was thought that he did not design to do it, when he gave him a great number of blows with the but end of his lance, of which he died the next day. The emperor shewed afterwards a great deal of sorrow at it, confessing that he repented of what he had done. This, however, was all in vain, for the young man was dead; and those who fear the consequences of crimes, should never commit them.

This monarch repeated a prayer every morning before day break, and then he went out to superintend his works, which were of a vast extent, both within and without his palace. Here the poor slaves were employed, and all of them, whether Moors or Christians, experienced his anger in their turns. Sometimes he killed half a score of them in a morning, and, strange as it may appear, he usually looked with complacency on others. Here were no means for the aggrieved to receive a reparation of his wrongs; the will of the prince was a law, and the vilest of all brutal passions triumphed over the rights of men.

About nine in the morning his court assembled, every one trembling for his fate; Muley sometimes stabbed them dead with his own scymetar, and sometimes he ordered them, for a piece of fun, to be strangled. His greatest favourites were the Jews, and at the head of them was Ben Hattar, whom we have already mentioned frequently in the course of this work. These Jews, and all his other favourites, come bareheaded and barefooted before him, and then they appear in their real colours, namely, as slaves. The moment he makes his appearance, they prostrate themselves before him, and hold out their necks for the sabre. In some cases here was more than formality, for sometimes the emperor actually cut off the head of the supplicant, and threw it to the dogs. His looks generally spoke the real emotions of his mind; and it frequently happened, that the person doomed to destruction was permitted to live twenty-four hours longer. When he speaks, every one of the unhappy creatures cries out, "God lengthen thy days, my lord; God bless thy life." Which expression once occasioned an accidental jest; for he was saying, "May I be called the greatest of liars, if I have not always conceived a great esteem for the English," and making a pause at the word liars, some of his courtiers called out, "My lord, it is true, for you are the greatest liar in the universe."

When he does not chuse to come out of his room, or apartments, where his women reside, then he sends for his sycophants to attend him, and treats them in the same manner as if he had been in the hall of audience. When he walks without the gate of his palace, all his courtiers were obliged to follow him, barefooted, through the dirt; and he was esteemed the most honourable, who could come soonest up through the mud to touch his stirrup. If he has occasion to send a message, let it be of ever so trivial a nature, the greatest of his attendants are the most forward to run with it, as if they had been beasts of burden. Even his favourite Hameda used to make his court this way, and often returned all over with dust.

Those days on which he did not come abroad, his courtiers remained in an alley of the palace till dinner, when the emperor sent for such as he esteemed. Before these favourites victuals were placed, and as this

was a sign that the emperor was in a good humour, consequently they ate heartily. Sometimes when he goes out of town, which is not often, he is attended by fifteen or twenty thousand blacks on horseback, with whom he diverts himself.

In the year 1690, before he was master of Sabra, there came a woman from that people to him, and he hearing of her coming, went out to meet her on horseback, at the head of twenty thousand men. She told him, the people of Sabra were desirous to put themselves under his protection, but that he must fight her at lance-play, and his title to sovereignty would depend upon his dexterity. They entered into the engagement, and the consequence was, the woman, perhaps from motives of good nature on the other side, was triumphant, and troops were sent by the emperor to protect the frontiers of Sabra.

When this emperor went abroad, there was carried after him a stool, a kettle, water, and a skin, which is his table-cloth; and if he happens to be out at noon, his dinner is carried after him, upon the head of a negro, in a large wooden or copper vessel, which he dare not take from his head till the emperor asks for it. His other travelling utensils were a few guns, with other warlike instruments; but these are of such a trifling nature, being well known, that they do not so much as merit a serious or a particular description. Although the natives of his dominions were white, yet they were not so much esteemed by him as the blacks; for his mother having been a black, he conceived a strong prejudice in favour of those people. For this reason he gave all the encouragement in his power for the propagation of the black species, and these were more caressed than any others in his palace. Young black girls were admitted into his palace at very early ages, and there they were taught the Mahometan religion. But it was not girls alone that he ordered to be brought up in his seraglio, for this emperor had an equal affection for boys, and more for those who were black than for such as were white. These boys were to be brought up as the common executioners of those who were the objects of his resentment.

Their manner was, as soon as the word came out of the mouth of the emperor, to seize on the wretch ordered for execution; and they generally treated him with so much cruelty, that he was almost dead before they had dragged him to the place of execution. These wretches are so ready to murder and destroy, even while they are very young, that the magistrates themselves tremble at the sight of them; but the emperor looked upon them with the utmost pleasure, and placed his whole confidence in them. They surrounded him wherever he went, and most of them being the sons of his chief governors, great respect was paid to them.

Those who made a genteel appearance were immediately taken into favour; and if any of them had creditable relations, they were sure to be put into places of trust. Others, who had no person to recommend them, were lodged without the palace, and considered under the character of slaves. All this, however, is of a very precarious nature, for the will of the monarch sets aside moral obligation; that is, it sets it aside in operation, but still it cannot overturn it. Thus it frequently happened, that while we were at Mequinez, the Moors, who had been brought before the emperor for the commission of any crimes, was referred to the Jews, as the common executioners; and if they do not punish them in the most exemplary manner, then the son of Jacob was himself put to the bastinado, and sometimes he had a bow-string clapped round his neck, that he might be the more easily tied up to a tree.

They wear only a short small coat, without sleeves, which does not reach to their knees. Their heads are shaved, and always exposed to the sun; and this is done in order to make them as hardy as possible. A part, and sometimes all of them, are employed in the buildings, where they take off their cloaths, and lay-

ing them all in a heap, every one takes a basket, and removes earth, stones, or wood; and when they have done, he orders them to go to his Jew to receive some victuals, which, for the most part, is soup; and next day, being dressed, they appear under arms before the emperor.

Muley Ishmael, the emperor of whom we have been treating, used to beat these his slaves in the most cruel manner, and sometimes he did it merely as an amusement. Sometimes we saw forty or fifty of them laying sprawling on the ground, covered with blood, none of them daring to get up till he had left the place. While we were there, he killed three of them with his own hand, and these suffered not for crimes, but merely because the emperor wanted some sort of employment. When any of them wanted cloaths, the emperor considered who were his richest subjects, and to them he sent his slaves to be new rigged out. Perhaps this is a better way of proceeding than to raise taxes on the poor as well as the rich, as is done constantly among us. The rich are able to spare more, as the poor have too little to support themselves with.

These slaves are generally about eight hundred in number, and live in a sort of subordination to one another, much like our regiments, there being all sorts of officers, from the commander in chief down to the lowest subaltern. The first step in their preferment consisted in giving them a horse, which was delivered by the emperor himself, a horseman being in the highest esteem among them, for the foot are not much respected, inasmuch that he who commands thousands of them is not so much esteemed as the man who commands fifty horse. The moment they are advanced to be horsemen, the emperor sends them to one of his bashas, who gives them a command under him in his army; for it is necessary to observe, that Muley Ishmael had always two armies in the field, namely one against the Spaniards, and another against the Barbarians who resided in the mountains.

Many of these slaves were kept near the emperor to be sent on messages; for in general he placed more confidence in them than in any others. Sometimes they are sent with letters of thanks to the most esteemed among his bashas or other governors, and at other times they are sent to bring the heads of those who have given offence.

When they had been some time advanced to the degree of horsemen, and no government was vacant, he sent them to gather the tribute in the distant provinces. Whenever it happened that the emperor imagined any of these had kept back part of the money, he commanded them to go and build a house out of their own money; and although there was no such thing as disputing his orders, yet despair often made them go and fall down on their knees before him, and tell him they had not one farthing more in the world. In such cases the emperor generally drew his sabre, and cut off their hands; but some of them, more in favour than the rest, think themselves extremely happy when they can get off with five hundred strokes on the soles of their feet. Sometimes they are loaded with chains, and sent to work as slaves at the house they had been building, and which another was obliged to finish.

Whenever this emperor intended to prefer a man to a place of honour or profit, he was sure first to beat him with a cane until he was almost breathless; and if he bore this unmerited chastisement without repining, then he was looked upon as a man of courage. It frequently happened when we were at Mequinez, that the emperor went out to see his men at work; and when he saw any of these officers in chains whom he had degraded, he called them his dear friends and brethren, asking them, at the same time, how they were brought into that unhappy condition, as if he had been totally ignorant of it. On such occasions he would frequently send for a suit of his own cloaths, and having ordered the prisoner to be dressed, gave him the command of a province; for by this way of proceeding, he has always an opportunity of keeping them obedient to all his orders; for having once tasted

a considerable share of wholesome correction, they are not willing to go a second time through the discipline.

They told us a story of a Spaniard, who was esteemed a good marksman, and tried to shoot the emperor; but missing his aim, the two balls, with which the pistol was charged, went into the pommel of the saddle. The Spaniard was immediately seized, and when it was expected he would be put to a cruel death, the emperor first reproached him with his base mean design, asking him, what he had done to deserve being used so; whether he was not beloved by his subjects, or whether they were afraid of him. Having uttered these words, he ordered him to be sent to work among the Christian slaves. The Spaniard offered to turn Mahometan, and was actually circumcised, but continued still in the Christian habit. Some time afterwards, the emperor going one day among the watermen where this Spaniard was, asked him why he did not pull off his habit, he answered him he was a Mahometan; and the emperor having learned that it was so, ordered him to be set at liberty, asked pardon for having kept him in a state of confinement so long, and made him *basha* or governor of a province.

In general this is the manner in which he treats his courtiers; for one day they are raised to the highest pinnacle of honour, and the next, perhaps, sent chained to work as slaves. Many of his people bore the marks of his scymetar, for Muley was so good natured, that he put them to death, or gave them a few cuts, merely for his amusement. Sometimes he threw his lance up in the air, and one of his slaves was obliged to catch hold of it before it got to the ground; and if a particular one was appointed for that purpose, and was so unfortunate as not to catch it, then the emperor, with the utmost deliberation, and with all the coolness in the world, drew his *fabre* and cut off the slave's head. When by accident he killed any one whom he only meant to chastise, he begged pardon of the bystanders, telling them he had no intention of killing the poor man, but God had ordered it; for these Mahometans are strong believers in the doctrine of absolute predestination.

When he designed to put any of his Christian slaves to death, he ordered all the gates of his palace to be shut, because of one Juan a Spaniard, who had such influence over his Moorish majesty, that if he interceded with the emperor in favour of a criminal, the request was granted; he therefore shut the gates to keep him out.

This emperor, Muley Ishmael, had a most retentive memory, and was what the world calls a great politician, although some of his actions shewed him to be whimsical enough, and even brutal and cruel. He acted either justly or unjustly, as the caprice of his inclination led him; for being directed by his passions, and his will being a law, there was none who dared to controul him. He believed that all his passions were directed by the Divine Being; and thus, when he had a fancy to divert himself, by putting some of his subjects to death, he said, he did it because God had directed him.

When he was angry with the Moorish slaves, then the Christian ones were his favourites, and with them he would frequently converse, calling them *bon Christians*, and wishing God would give them their liberty, just as if it had not been in his own power to do it; but his wrath was terrible, which many of the poor Christians felt. One day passing by a high wall, on which they were at work, and being angry because they did not keep time as he had desired they should, he ordered his guards to go up and throw them all off from the walls, breaking their legs and arms, and knocking out their brains in a most miserable manner. Another time he ordered them to bury a man alive, and beat him down along with the mortar in the wall.

Nor was he less cruel to the Moors, whom he frequently commanded to be burnt, crucified, sawed in two, or dragged at the tail of a mule through the streets,

till they were torn all to pieces. The most favourable death was to die by his own hand, for then they were only obliged to kneel down till he cut off their heads, or stabbed them with his dagger. For these barbarous purposes he had always his implements ready, such as his lance, *fabre*, and poniards. He was extremely dexterous in the use of them, and would cut off a man's head, or stab him through the heart with the same ease as a surgeon in England would open a vein.

The fifteenth, the first of ramiadan being over, the emperor went to pray in a field, a little way out of the city, which he does three times in the year. He was attended by a vast number of people, some on horseback, and others on foot, who waited at an awful distance with great silence, while he prayed under a canopy set up for that purpose. As soon as he had done praying, and was mounted again, the drums beat, and the horses began to cavalcade. The ambassador was upon the town-wall, close by which the emperor and all his attendants returned, so that we had a full view of them, and indeed to us they appeared comical enough.

Near this part of the wall was a spacious convent, and the prior had built a fine scaffold for our reception. About ten o'clock in the forenoon, they began to pass by in great numbers, and some of the foot continued firing, and horse cavalcading; some with lances, and others with firelocks, which presenting at one another's heads as they galloped along, they sometimes set their turbans on fire, and burnt their faces in a terrible manner. The smoke having a little subsided, we began to have a better view of them. There were about eight or ten blacks carrying colours, with great gilt balls on the tops of their staves. They were employed by the emperor's soldiers, who jumped about and fired in the ground before them: this seemed to us such a ridiculous piece of nonsensical parade, that we hardly knew what to compare it to.

This part of the ridiculous procession being over, Muley Mahomet Sariba, one of the emperor's sons, made his appearance. This young prince was master of the horse, and he was attended by guards both of horse and foot, at the head of which he rode, with a lance in his hand; the place where the wood joined to the way being covered with gold. Then came a calash, with six black women holding by the side, which was covered all over, so that we could not see who was in it. After that came a large red standard, with a crescent in the middle, surrounded with soldiers, who fired and shouted as they went along. It is necessary to observe, that the crescent or half-moon is the grand standard of the Turks or Mahometans, in any part of the world, and probably it might have been used by Mahomet. This much, however, is certain, that in the eleventh century, Saladine, the great general of the Saracens, wore it as his standard; and the first Anglo Norman baron, Percy, having taken one of these standards, the Northumberland family quarters the crescents.

The next person who made his appearance was the emperor, with a fuzee in his hand. His slaves kept twirling his umbrella over his head, and fanning and beating the flies from his horse. As he came almost over-against us, he presented his piece at a Moor, who was got very near him, but did not fire, the guards seizing on the fellow, and hurried him away to be executed for his presumption. Just before the emperor mustered a company of his foot guards, clothed all in leopard and tygers skins, and a guard of young blacks with lances and fire arms intermixed.

Round about him rode a great many of his sons, and behind them troops of horse, all in rich armour, some being gilt all over, others only with helmets, which were of several shapes. After them went a great number of foot with spears, battle-axes, bills, and all other sorts of warlike instruments. This body of foot having passed, there came twenty of the emperor's led horses, with saddles of beaten gold, set with emeralds and other stones, some of which were very large; this furnished us with the view of a set of fine well managed

naged horses, in shape far exceeding those in Europe, and some of them were extremely beautiful.

After them came Muley Abdallah, another of the emperor's sons, with a guard of horse and foot. All those marched with lances, and probably in order to shew their dexterity, they made several movements when they passed the place where we stood. The next that passed was the basha of Mequinez, who, in virtue of his office, is always prime minister to the emperor. Vast numbers of other horsemen followed; but as every person of any consequence had passed, the ambassador went into the convent, where we dined with the prior, who treated us with great civility, but his cooks being all Spaniards, the victuals were not dressed to our taste, and the wine was exceeding bad. This convent was built by the king of Spain, for the reception of Christian slaves, and an annuity of hundred pistoles was settled on it, and it is capable of accommodating above an hundred persons. There are besides the prior, four monks and the physician, whom the emperor protects upon account of yearly presents that are made him; and here all such Christian slaves as are sick are lodged.

On the nineteenth, we were presented with an instance of that cruelty which seemed to be inherent in the nature of this emperor. We have already taken notice, that Carbe Shott, who was a favourite belonging to the basha of Tetuan, was imprisoned at our coming to Mequinez. This man was of one of the best families in Barbary, being literally descended from the old Andalusian Moors, and deserved, by his conduct, the esteem both of his own countrymen, and of us, for he had a great regard for the English, having been some years at Gibraltar, as a pledge from the basha to an English merchant, for the payment of money due for English goods he had supplied the basha with.

Part of the crime laid to his charge, was for going out of his country, and living in Christendom a considerable time, without the emperor's knowledge; and having defiled himself with Christian women, and often got drunk. He was also accused of being an unbeliever, and one of those who had invited the Spaniards to invade Barbary. These things being asserted to the emperor, after the usual manner of that court, where every one has it in his power to do harm, but few to do good, brought this poor honest man to his end. Early this morning he was carried before the emperor, who would not suffer him to speak a word in vindication of himself, but ordered him immediately to be put to death. He was directly led to the place of execution, which is at one of the gates of the city, and there tied between two boards, and sawed in two; the executioner beginning at his head, and sawing downwards, till his body fell asunder, which must have been eaten by the dogs, had not the emperor granted leave to bury him, which was esteemed one of the greatest favours he ever had granted to any of his subjects, who had suffered in a similar manner. Here was an instance of inhuman treatment with which we Europeans are unacquainted; but we were witnesses of it, and can attest it to be true.

The constant repetition of so many acts of cruelty naturally must have affected the conscience of the emperor; for nothing can put conscience to sleep while guilt is awake.

No secret action but it ponders well,
And reprimands with an interior hell.

Thus it frequently happened, that the emperor was greatly disturbed in his sleep by frightful dreams and visions; and sometimes he imagined that he saw those persons before him whom he had cruelly murdered.

The next morning after Shott was executed, it was reported that the emperor had dreamed that he appeared to him, and asked him what he had done to be treated in such a barbarous manner; telling him at the same time, that there would be a day when God

would judge between them. But let the reader here behold, or rather let him read, with the utmost astonishment, what methods the cruel emperor made use of, in order to give ease to his guilty conscience. He did not acknowledge his crimes before God, and his subjects; he did not break off his sins by righteousness, nor his iniquities by shewing mercy to the poor; but he sent for a handful of the ashes, mixed with the blood of the murdered person, and with that rubbed himself all over.

At this time there were a vast number of Spanish slaves in Morocco, and these not being pleased to see the British ones set at liberty, did all that lay in their power to disappoint the design upon which the ambassador had been sent. These Spaniards had prevailed so far upon the emperor, that he sent word to the ambassador, he might return home as soon as he pleased; and that when he came to Tetuan, he might talk with the basha concerning the redemption of the slaves.

But the ambassador perceiving the emperor was about to put him off, consulted with Ben Hattar, the Jew, who advised him to write to one of the queens, in a submissive manner, as the only means of getting his design accomplished. And as nothing can so well shew how precarious all negociations are, where it is necessary to make use of artifice, and methods of deceit, we shall here insert this very remarkable letter.

Powerful Lady, Mother of Muley Abdallah,

THE most important knowledge of the authority lodged in your majesty, I learned while I was at Lisbon; where endeavouring, as is the custom of all who are to go into foreign countries, to know the persons of greatest power who can best forward their negociations, and make relation of them to the king. I met with an old Christian, who had been your majesty's slave two years, and received his liberty by your clemency; and talking with him about my embassy, he informed me that your majesty was the chief person in this court, who could do me service; for by your means my business would come to the ears of his imperial majesty, and for my better memory, he told me the name of your majesty's mother, the lady Halima, by whose hands he advised me to convey the letter I should write to your majesty; which I have accordingly done, asking pardon for my boldness in following the advice of the said captive, desiring your majesty to consider the requests I make; and not doubting your approbation thereof, whose protection I promise myself, so that the full meaning may come to the ears of his imperial majesty; for there cannot be wanting in his royal palace a person that can read it.

Upon which dependance I represent to your majesty, that I came to this court with sincere friendship, and loyal meaning, to kiss the hands of his imperial majesty, whose honour I had, and in consideration of which, when I arrived at Gibraltar with my sovereign's orders, I wrote to his imperial majesty, acquainting him with my intentions, and the orders of the king of Great Britain, my master, desiring him to appoint one of his servants to treat for a lasting peace, and redemption of my captive brethren; and also to give leave for me and my retinue to come to this court.

Which letter his imperial majesty was graciously pleased to receive, and did me the honour to send an answer; giving me leave to take the said journey with all security, as well for my own person as for those who should accompany me; and ordered basha Hamet Ben Ally to treat with me, concerning a peace, and the redemption of English captives, as was the case with his father Ally, who transacted these affairs. This answer pleased me well, and encouraged by it, I went to Tetuan, where I conferred with the said basha about a peace and the redemption of my brethren, in consideration of a quantity of powder, locks, brimstone, cloth, and all the Moors whom we had prisoners: and having treated upon these considerations,

he asked me to give him leave to send a copy of the conditions to his imperial majesty, to see if he was contented therewith; for if he was not, he could not conclude any thing, his imperial majesty being absolute master therein; which request, I told him, was very reasonable.

In the mean time I continued at anchor with my ships in the port of Tetuan, till an answer came from his imperial majesty, who ordered that the aforesaid agreement should be signed; and sent me a letter, which I have beside me, to the same effect; upon which the articles were signed. And at the same time I sent a ship to London, giving an account to my master, the king of Great Britain, of the treaty, with a copy inclosed of his imperial majesty's letter; and a letter from the said basha, respecting the good intentions of his imperial majesty towards us; and also desired that the ransom might be got ready with all possible expedition; it being a rule with the king, my master, to fulfil all his engagements, and never, on any consideration, to break through the sacred faith of treaties.

With all which the king, my master, was very well pleased; immediately ordered the ransom to be got ready, and sent me a writing, sealed with his royal seal, and signed with his hand, confirming all that I had done; sending me also a letter to deliver into the hands of his imperial majesty, ratifying and confirming the treaty, which I delivered this day, when I had the honour to be received by his imperial majesty.

Also the king, my master, ordered me to stay some time at Gibraltar, if it was convenient, till the ransom should arrive, that I might take it along with me; but if I should go to this court before it came, I should bring along with me all the captive Moors, and the presents. But the basha being sent for to court, I was obliged to set forward without the ransom, taking with me the presents, and the captive Moors. And when I got to Alcazar, I heard that a ship had arrived at Gibraltar, with the greatest part of the ransom; only some of the locks were wanting, because they never make any in England but when they are wanted; but they are now getting ready with all expedition.

His imperial majesty received me with honour, giving me leave to visit his majesty's palace, whose equal was never seen in the world; and he told me he would comply with all my desires. At this I rejoiced, having had the honour to be a mediator between two such powerful sovereigns, as his imperial majesty is among the Moorish nations, and the king, my master, is among the Christians.

This day I received a message from his imperial majesty by the hands of a renegado, telling me, he was sensible I might have business to do elsewhere in the service of the king, my master, for which reason he desired not to detain me, but I was at liberty to depart as soon as I pleased; and as for the ransom of the captives, I was to agree with the basha of Tetuan. That in every article relating to naval affairs, he would comply with the proposals I had made, and give the king, my master, the utmost satisfaction.

Considering well this message which his imperial majesty sent, I remained in doubt whether they were his true words, or not well understood by the renegado. Nevertheless, I answered the said renegado, that concerning treating with the basha at Tetuan, about the price and redemption of captives, I thought nothing more remained to do; because upon our treating there before, we had each of us signed the articles of peace, and I had a letter of his imperial majesty's in my hands, agreeing to what was done; so that nothing further was wanting therein, but that his imperial majesty would give orders for the Christians to be set at liberty, and I would pay the ransom agreed on. But if there was any thing else concerning which he would have me confer with the basha, I thought it was not necessary; for since I had the honour to be in his royal court, I would rather explain myself to his imperial majesty,

without any mediator; and, if there was any thing in which I could serve him, I would do it with a great deal of pleasure.

Wherefore I beg your majesty will explain all these things to the emperor, because, in discourse, being obliged to make use of an interpreter, I have hardly time to do it myself; and if his imperial majesty will consent to what has been settled, I shall go with great pleasure and honour to the king my master: upon which consideration, I beg your majesty will be pleased to recount these things to the emperor, and use your interest, that my request may be granted; for which I shall for ever remain, in all obedience,

Your Majesty's

most humble,

Mequinez,
July 20, 1721.

and most obedient Servant,

CHARLES STUART.

It is not our business to enter into a critical examination of the principal parts of this letter: upon the whole, it appears to contain nothing but the truth; for Mr. Stuart was sent to redeem the British captives, and, if it was his duty to proceed in the business as far as was consistent with moral honesty, and as far as that is connected with political agreement, there is no doubt but he received some assistance from Ben Hattar the Jew, and through the intrigues of that son of Jacob he got the letter conveyed to the queen, who sent him the following answer.

To the ambassador who wrote me this letter.

I RECEIVED your letter, and what you say to me therein have read, and understand what you mean in part, although perhaps not so well as I could wish. I have spoke to the emperor, whom God preserve, of what you say, without failing to explain to him all in its full meaning. His majesty was well pleased, and told me, that there never was a Christian who appeared at his court that behaved with so much affability as you have done; your graceful manner, your very engaging carriage, and your refined understanding, all joined together, have endeared you to the greatest of sovereigns.

Concerning what you have written to me, about the redemption of Christian slaves, and the agreement you made with the basha, his majesty declares, that he has not been made acquainted with the particulars; nor has the quantity of ammunition been either signified to him, or sent. In such cases, it was very difficult for his majesty to give a distinct answer, and therefore he delayed till you should have a more explicit account from your own court, transmitted by the way of Gibraltar.

His majesty declares, that he does not know how many of your Christian brethren are confined here, in a state of slavery; because some have turned to the Mahometan religion, and others are dead. But now, since your excellency has delivered your design to me, there is no occasion to apply to basha Hamel, or any one else; for I will speak to the emperor, whom God preserve, to the end that he may receive the agreement intirely, and do every thing you desire; for in his majesty there is much goodness and generosity. This is my answer.

The Mother of Muley Abdallah.

UMELEZ ETTABBA.

July 23. The ambassador, as a man of spirit, having made his case known to the queen, the emperor ordered the Christian slaves to be drawn up before him, and having sent for all those who were of the British nation, the ambassador was desired to attend; she went in grand procession, with the musick playing before us, and found the emperor sitting under some piazzas, but on our approach he mounted his horse, and saluted the ambassador with *Bono, bono*, which, perhaps, is all that those barbarians know of Latin. He told him at first, that he did not know that he had full powers to conclude a peace, but thought he only came

to prepare the way for another ambassador; but now finding he had sufficient authority, told him he should save all his countrymen, and at the same time waving his hand to the captives, he bade them go home, along with the ambassador, into their own country; upon which they all fell prostrate on the ground, crying out "God bless thy power," and were going out of his presence, when the emperor ordered them to stay, saying that he loved the English, because he knew they loved him and his house, and that there should not for the future be an Englishman a slave in his dominions. Then waving his hand to the captives, they went away, and the ambassador returned the emperor thanks for the honour he had done him; telling him, that he should always regard his interest when he was gone out of his dominions: to which the emperor answered, that he should see how well he deserved the present that had been given him. Upon that the emperor took his leave, and having mounted on horseback, galloped off as fast as he possibly could, with his friends following close behind.

Our captives, who were in the palace before we came, told us that the emperor had been in a great passion with some of his officers, and had actually wounded some of them with his lance; but this was a mere trifle with his Moorish majesty.

On the twenty-fourth, we went to see the emperor's stables, which were about three miles from the town. They consisted of two very long buildings, with handsome arches all around, under which the horses stand without any partition, there being an arch for every horse: they stand twelve feet from each other; and in these stables are seldom less than one hundred horses. Through the middle of the square runs a small canal, over which, at certain distances, are built little houses, where they keep the provender and furniture for the horses: and the emperor has ten thousand more horses, which he keeps in the country, to be ready at his call when wanted.

The horses in this country are very fine, and the people take much pleasure in breeding them to all sorts of martial exercises. They break them, in general, when they are but two years old, and keep training them till they find they are in a state of perfection fit for any exercise: at grass, they sometimes tie the two fore feet together, and at other times a fore foot and a hinder one. In their stables they have two iron pins drove into the ground, one before and the other behind, at the distance of about three feet from their legs, which are fastened together like our traves with which we break horses to pace: but being short, they draw their legs together under their bellies, and two ropes come from their hind and fore feet, which are so contrived, that they cannot step above one foot forward or backward: their collar is also made fast to the pin before them, which has a ring for that purpose: under these is a hole covered with pieces of wood, to receive their water, and a little on one side a bed of sand or saw-dust, for them to lie on, for they have no mangers, but eat their straw or grass off the ground.

All their horses eat grass in April and May, and, if the season is favourable, a great part of March; at other times they eat straw instead of hay, and their barley is given them in a bag put over their heads, but they are very dextrous in laying hold of it; for it may be justly said, in such cases, that nature is the best assistant.

They are never dressed, nor their tails or manes combed, but when dirty are carried to the next running water and washed, and if they would have them look fine, they use a little soap: some of them take it amiss when a Christian presumes to touch a horse with the palm of their hand, or stroke him: they never crop their tails or ears, nor geld them; for, except eunuchs, they do not chuse to have any maimed creatures.

These people have always been great lovers of horses, and they have a proverb, that there are three things in the world superior to all other things, namely, a horse, a woman, and a book: nay, they go so far as to keep genealogies of their horses, amounting some-

times to a series of three or four hundred years. They have a very odd way of shoeing them, for they cut off the fore part of the hoof, and set on an iron shoe, in a triangular form, with the two points facing the heel; these points are made very thin and strong, and the nails are beaten as close to the hoof as possible. However, a few years before we arrived in the country, a Turk from Constantinople arrived in Mequinez, and pointed out the impropriety of shoeing the horses in the old manner; upon which the emperor issued a proclamation, commanding that all the shoes used by the horses should be round, in the form of rings, and this order was in general complied with.

As for those called Berebbers, or Barbarians, who inhabit the mountains, they never shoe their horses. The feet of these creatures must be a great deal harder than those we have, although our climate is much colder; for while we were there, one of them rode one hundred miles in one day, over hard rugged ground, without so much as hurting his feet, notwithstanding his having no shoes. These horses live to a great age, and are very fresh at fourteen or fifteen: the reason seems to be their uniform manner of walking, they seldom ever going beyond a gentle pace.

Near the stables is a large space of ground, walled about, in which we always saw great numbers of ostriches.

One day we went to visit Muley Abdallah at his country seat, who received the ambassador with a great deal of good humour and politeness. He had a fresh lively countenance, and was very well attended, though not by so many servants as some of the rest of his brothers. He shewed us a fine large lion, which was so tame as to suffer a man to go into his den and play with him: he also made two mastiff dogs fight to divert us; and in the mean time one of his guards picked the pocket of a gentleman in our company; a practice at which these people are very ingenious, as every one in the ambassador's retinue experimentally knew either in one place or another.

This day our captives began their journey, eager to return from a state of slavery to a land of liberty, where they had been brought up.

The twenty-fifth the ambassador went to visit Muley Alley, a son of the emperor, and in great favour with him. He received us very graciously, and treated us with the sincerest marks of respect. He was seated on a silk carpet, wrought with gold in large flowers as big as a man's hand; and two black boys were fanning him, very neatly dressed. One of them had a vest of black and white flowered velvet, and the other was of yellow, with white spots. The prince's garment was of as rich cloth as could be seen, and his apartment had some neat furniture in it.

He ordered his attendants to bring us chairs, and we sat down, the ambassador talking to him by one of our captives, who rested himself on his hands and knees at the threshold of the door; and when he spoke to the prince, prostrated himself almost close to the ground, so great was the respect paid to the sons of this emperor. We were next had up stairs, and entertained with wine and musiah till dinner, which consisted of above twenty large dishes, dressed several ways.

We happened to visit this prince rather at an improper time, for he was so ill, that he could not stir out of his room, which deprived us of the sight of his women; for, contrary to the custom of the Moors, he frequently shewed his women to strangers. However, he sent a message up stairs to the ambassador, desiring to know whether he could do any thing to serve him; who returning him thanks, told him he would be under great obligations to him if he could make interest for him to carry one of their fine horses out of the country. The prince sent word that he would give him one, and take care that it should be got safe on board. Then the ambassador made him a present of a handsome gold watch, with a chain and seal.

This prince was fond of curiosities, for he had a room filled with clocks, watches, fine china jars, with many

many other things, in all which he took great pleasure, spending much of his time among them. It seems he was a favourite son, and his father frequently gave him such things as had been presented to himself. He had also in his stables a great number of the most beautiful horses we had seen in Africa, being far superior to what are found any where else in the world.

While we were at Mequinez, an account came from Sallee, that some of their rovers had taken a Portuguese ship, in which were three Englishmen, of which the emperor being informed, ordered them to be immediately set at liberty, notwithstanding their being taken under other colours.

Mequinez stands about forty miles west of Fez, and was but a small place till Muley Ishmael chose to settle in it, where he built his palace. It is situated in a most delightful place, having a very serene clear air, which induced the emperor to prefer it to Fez; and it is now in a very flourishing state, having a vast number of new buildings, with public structures for the courts of justice.

In the middle of the city live the Jews, having a place for themselves, the gates of which are shut at nights, which privileges the Jews enjoy in the other cities of the empire. These Jews have a magistrate who presides over them, and his duty is to take care that no person insult them, and also that they may keep the peace among themselves. This is the more necessary, because of their being much hated by the lower class of people, for no other reason, as would seem, but that most of them are concerned in usury or pawn-broking. It is a capital offence in any of them to curse or lift up a hand against the meanest Moor; and when they pass by a mosque, they are obliged to pull off their shoes. They are all obliged to wear black cloaths, and caps of the same colour, to distinguish them from the Moors; nor are they allowed the use of horses; for Ben Hattar, although a favourite with the emperor, was obliged to ride on a mule.

Close to Mequinez, on the north side, only divided by a road, stands a large negro town, that takes up as much ground as the city, but the houses are not so high, nor so well built. All the inhabitants are blacks or tawnies, and from amongst them the emperor generally recruits his army.

The palace stands intirely on the south of the city, and was built from the foundation by Muley Ishmael, for they shewed us a house near it in which he resided when he was no more than governor of the town of Mequinez.

His palace is taken care of by several hundreds of black eunuchs, lusty fellows, well dressed, having silver-hilted swords. The chief of these is in great esteem with the emperor, and has vast authority in the palace, both over the women and children, so that we have seen one of the young princes, from whom a basha would run away if he was angry, come up to this eunuch, salute him, kiss the hem of his garment, and speak to him in the most humble manner. He is always followed by a slave, who carries in one hand a scourge, and in another a stick for bastinadoing, as signs of his authority. This was the practice of the Romans, whose tribunes were always followed by the lictors. But what was most remarkable, our captives assured us, that this eunuch kept a seraglio of women, merely from a motive of ostentation.

In this palace lived the emperor's four favourite wives or empresses; and it was confidently told us, that he had above two thousand women besides. To keep such a large family in proper subjection must have required no small care; and this emperor was as much dreaded by his women within the palace, as he was by his subjects and slaves without. It frequently happened that some of these women quarrelled and fought; and when complaint was made to the emperor, in order to shew his impartiality, he commanded both parties to be put to death. This was an effectual way of putting an end to disputes, and nothing was more common than to see thirty of these women strangled in one day. The executioners are the black eunuchs,

who twist a small cord round their necks till they are dead; so dreadful was the power and cruelty of this barbarous tyrant.

Such of his women who were so happy as to receive his caresses, partook of his sanctity; for no sooner did they come out of his chamber, than they were carried about the palace in a sort of triumph; and on such occasions it was reckoned an honour by the rest of the females to kiss the hem of the garment, which she veils herself with, in hopes that they might be the next who were to be taken to his embraces. He made it a constant rule never to lie with a woman more than once, unless she proved with child, for barrenness is considered by them in almost as odious a light as it was formerly among the Jews; but if the woman has a child, then she is taken into favour, and the emperor takes her again to his bed.

We were assured, that this emperor had by his numerous wives and concubines no less than seven hundred sons, all fit to mount on horseback; and this, perhaps, will not be thought strange, when it is considered what a vast number of years he had reigned. But then at the same time this will not shew the utility of polygamy; for as he kept such a vast number of women, consequently so many of his subjects must have been without wives. But then on the other hand it may be considered, and ought to be attended to, that many of his subjects are slaves, who consequently could not have an opportunity of enjoying women; for all those who know any thing of human nature must acknowledge, that slavery weakens the passions, while it depresses the mind.

He married his sons as soon as they were of proper age, and sent them to reside in some of the provinces. But there was another sort of these women kept by him, whom he called his queens, and their sons were treated as favourites. These sons lived in the palace, having great authority, for they put to death with their own hands the greatest officer who had the misfortune to incur their displeasure. They had always a guard of blacks to attend them, who put their commands in execution without the least hesitation, let them have been ever so rigorous. The emperor suffered these sons of his to live in the palace till he imagined they would become unruly among the women, and then they were disposed of in marriage to such wives as their mothers could procure for them. Those who had the misfortune to lose their mothers, or were out of favour with the emperor, were suffered to shift for themselves, being totally neglected and exposed to all sorts of hardships. But to some of them he gave the government of the best provinces, but limits them as to the number of troops they are to keep in pay. This part of his conduct was the more necessary, because one of his sons, Muley Mahomet, had taken up arms against him, and raised a formidable and audacious rebellion, which was not suppressed till many thousands of the subjects had lost their lives; but the wretched prisoners who were taken by his troops were all crucified, as a terrible example for the others.

He had three sons, who, after this rebellion was suppressed, stood highest in his favour. Their names were Muley Hamet, Muley Zeriph, and Muley Abdelmelech, and each of these was a competitor for the succession.

Muley Hamet was the eldest, and in great favour with the emperor, who, in one of his wills, nominated him his successor. He had built himself a palace, and stocked it with women and eunuchs at Tedla, the chief city of Province, so called, about seventy miles south of Mequinez, which he had chosen for his seat, it being the custom of the emperor of Morocco never to reside in the same palace with the person appointed to succeed them.

While we were there, this prince spent most of his time in beautifying his palace, and diverting himself with his women. He was an absolute slave to drunkenness, and lavish of his favours when intoxicated; but when sober, very parsimonious. One day he met a Jew, and swore he would kill him, if he did not drink all the brandy in his flask, which the poor man did to save

save his life; although the prince knew, that had the emperor known it, he would have killed the Jew for getting drunk. Another time he forced two slaves, the one an Englishman, the other a Spaniard, to wrestle, telling them, that he would kill him who was beaten, and he kept his word, for the Spaniard being worsted, he immediately stabbed him dead.

He once entered the house of one of the bashas, and ravished one of his wives; and at another time he made an oration to a monkey, reproving him for not being a good Moor. When he was young, he spent much of his time in plaguing the slaves, for it was the constant practice of this inhuman barbarian, to go amongst them, and break the vessels in which they held their victuals.

His next brother, Muley Xeriph, was a sober prince, and the most humane of any of them. He commanded in the province of Darha, where he was often employed in skirmishing with the blacks upon the frontiers of his father's dominions. His mother was a Christian slave, whom the emperor had taken into his seraglio, and this prince was much esteemed by the Europeans, but his power was not very great.

Muley Abdelmelech resided at Taradent, and commanded that part of Suez contiguous to Santa Cruz. He was esteemed a good soldier, but cruel in his disposition, and brutal in his actions, being regarded by none but his soldiers. These three brothers lived on very ill terms with each other; they were continually contriving schemes to ingratiate themselves into the emperor's favour, and yet they sought the esteem of the people.

Thursday, July 27. We took our leave of Mequinez a little before sun-set, and travelling the same road that we came, halted about a week at Alcaffar, from whence we set out August 8, and on the twelfth arrived at Tetuan. Some of our poor redeemed captives died here and upon the road, and one was drowned in the river at Alcaffar. The basha went from Alcaffar to Tetuan, where we met him, but he was very dilatory in fixing a day for our captives to go on board. At last receiving a letter from one of the queens, whereupon she threatened him severely for detaining them, and the powder for their ransom, being arrived from Gibraltar, the ambassador had the good success to embark two hundred and ninety-six English, being all that were left alive, some of whom had been in captivity upwards of seven years.

Our captives told us a pleasant story of the emperor, concerning a difference that once happened between Memaran and Ben Hattar the Jew. Memaran was formerly the chief favourite at court, and had the sole command of the Jews; but seeing Ben Hattar pushing himself boldly forward, and being a rival in the emperor's favour, he endeavoured to destroy him, and offered the emperor one hundred weight of silver for his head. Upon which Ben Hattar was sent for, and told by the emperor that a sum of money had been offered for his head. He resolutely answered, he would give twice as much for the person's head who had offered it. Then the emperor bringing them together, took the money from both, telling them they were a couple of fools, and desired them to be good friends. This made Ben Hattar demand Memaran's daughter in marriage, which was complied with, and they governed the Jews conjunctly between them.

This barbarous custom of buying men's heads, is practised all over the empire, both among the Moors and Jews, whereby the enjoyment of life and property is not only precarious, but a man is liable, in an instant, to fall into the utmost degree of misery, at the pleasure of any one who, prompted either by covetousness or malice, will be at the expence of buying another, and run the risk of being reimbursed the money arising from the sale of the unfortunate person's effects. In such cases, they go before the *cadi* or judge, who orders the wretch to be delivered up to the buyer, who may cut off his head as soon as he pleases, or put him to death in any other manner, just as his fancy leads him.

As a proof of the barbarity alluded to, we shall here insert an extract from a letter, written by Mr. Hatfield, an English merchant residing at Tetuan.

"Yesterday Mr. Noble and I were passing by the prison, where we saw a man hanged by the heels, with irons upon his legs, and pinchers upon his nose, his flesh cut with scissars, and two men continually beating him, and demanding money. When the poor creature was rendered unable to speak, they renewed their blows; and this was a bought man, for whom they had given five hundred ducats. This torture was so severe, that Mr. Noble, when he saw him, cried out, O Lord! the blessed fruits of arbitrary government!"

The basha of Tetuan had been for three weeks together in the greatest consternation imaginable, every day coming into the emperor's presence, and in fear of being put to some cruel death, so that he fell ill, and what between sickness and fright, was reduced to a very low condition. At length the emperor gave him leave to go to his government, but not without a fine; for, besides the present he brought with him, which consisted of gold, silver, and costly goods he had bought, he also brought above a hundred fine horses and mules, with something of every article produced in his province; but all this did not satisfy this rapacious emperor, who ordered him to pay three hundred pounds weight of silver, and sent an officer along with him to bring it to court.

The basha found it extremely difficult to raise the money to pay the fine, so that after he had collected all he could raise among his people, he was obliged to raffle his own seraglio to raise the sum. Having spread a cloth on the ground, he called all his women together, who threw down what they had of value, and stript themselves even to their ear-rings. During this transaction, one of his younger sons came in, and seeing what they were doing, pulled out his ear-rings, saying, "There, father, take mine too," which so much affected the basha, that he shed tears. At last the sum was completed, and he being sent for again to court, the emperor received him into favour; and when he sent him back to his government, he gave him twenty-four blacks of his own guard; the locks and ornaments of whose arms were made of gold.

The basha had succeeded his father, who originally was no more than a poor courtier; but by some means or other, having been taken notice of by the emperor, good fortune smiled upon him, so that he rose from one degree of preferment to another, till he obtained the government of this province. At the same time he swore to him on the alcoran, that he would never put him, or any of his family, to death. When he died, he bestowed the government upon his son, according to his promise, and at the same time advanced the rest of his children to several considerable places.

They have a notion at Mequinez, that when the emperor dies, an attempt will always be made to set up a person on the throne, descended from a family which had reigned here many years before. This seems to have some resemblance to our notions of a popish pretender; but these suppositions and fears are little regarded by those who know any thing of government.

One cannot behold the beautiful appearance of this country without, at the same time, lamenting that the government should be so arbitrary as to discourage industry and improvement, for it is a most delightful climate; the soil generous and fertile, abounding in all things both for use and pleasure, even beyond imagination; nature, in a great measure, supplying their idleness, and want of industry. They follow the customs of the Spaniards in tilling the ground, which produces great quantities of wheat, barley, pease, beans, hemp, and flax; and they have three harvests in the year, between the months of May and September.

If the government would but give any countenance to industry, or at least, allow every one the peaceable enjoyment

enjoyment of the fruits of his labour, the land would be capable of producing an hundred times as much as is consumed in the country; for we heard many judicious persons say, that the hundredth part is not cultivated; and the emperor had always as much corn under ground as would supply the whole country five years. But on the contrary, whenever a poor man got a pair of oxen, and a plough, he was liable to be robbed of them by the next petty governor that came into the province; for which reason much of the land lies unimproved, few persons chusing to claim a property in it, and fewer still to spend their time in labouring for what they are not to enjoy. When we inquired who were the proprietors of the small cottages which frequently presented themselves to our view, we were told that they belonged to some of the governors, who had fixed their slaves in them; and these poor slaves were obliged to cultivate the ground for a precarious subsistence.

Thus in consequence of neglecting to give encouragement to honest industry, and suffering the ground in many places to remain in this state, the tribes of Arabs wander up and down the country, and pitch their tents wherever they please; and indeed it was confidently affirmed to us, that, wild and unsettled as these Arabs are, yet they enjoy more happiness under their little patriarchal chief, than those of the highest rank, who are under the arbitrary government of the emperor of Morocco.

There are many articles of commerce exported from this extensive province of Tetuan, and these are brought hither from other parts of the empire. These consist chiefly of tin, copper, wax, hides, wool, honey, dates, raisins, olives, almonds, and cordovins; and they have also indigo, gum-arabic, gum-sandarac, elephants teeth, ostriches feathers, and fine mats. They are by their religion forbidden the use of wine, but they employ the Jews and Christians to make it, and export it in large quantities. Their grapes are exceeding good, and the wine equal to the best made in Spain; and without doubt, was it to be tolerated, they would make great improvements. The exportation of corn is likewise forbidden by their law, for which reason, together with the severity of the government, many beautiful fields lie waste, which if cultivated, would make this the richest empire in the world.

Fez is the centre of trade in this empire, and it is from thence that the caravans go every year to Mecca and Medina. These caravans are under the direction of a person who farms most of the wax from the emperor; and his trade is very great, for he admits his brothers, and other relations, into partnership with him. He intrusts the caravans to their care, and in their way they are always joined by the merchants of Algiers and Tunis, who put themselves under the protection of the captain, called the *stankero*. Two of these caravans are generally on the road at the same time; and as one sets out from Fez, the other returns from Mecca. The commodities carried into the east are woollen manufactures, such as alhagues and other garments, indigo, cochineal, and ostriches feathers; for which they bring in return silks, muslins, and drugs.

The English have a fair opportunity of spoiling this trade to Mecca, by transporting the silks from Turkey to Barbary by sea, and save the vast expence of land carriage; and it is not to be doubted but the covetousness of these Barbary tyrants would induce them to give this trade all manner of encouragement. Custom duties, levied for importing of these goods, paid by Europeans, would be a very tempting object, by bringing much money into the pockets of those persons whose avarice is insatiable; and it would prevent vast numbers of people from going out of the country, who rather chuse to live under the Turkish government, than at home, where they are treated more like beasts than men.

Muley Ishmael, the emperor, of whom we have been giving this account, once in his observations began to reflect on the vast disadvantages that arose from this merchandize to his empire, and fought out

for some pretexts to put a stop to it; but vulgar prejudices ran high against him. It was considered as a holy pilgrimage, which all true Mahometans were to perform as often as it lay in their power, because they were there to visit the tomb of their prophet. Some years ago there was an order issued to open all the loads that were sent in the caravans, under pretence of searching for jewels, which made those concerned in the trade engage to deliver all their jewels, and pay ten ducats for each load of goods; but this threw such a damp on their spirits, that the caravans became yearly less frequented than they had been before.

They likewise send caravans yearly to several parts of Guiney, particularly to the Black River, which their ignorance induces them to believe has an entrance into the South Seas; but none of them could give any proper account thereof. It is certain, that many caravans go directly from Fez into these remote countries, and sometimes there are twenty thousand persons in one. Indeed this will not appear accountable, when we consider the difficulty of the passage through the burning deserts, where there is neither victuals nor drink to be procured; for when they have passed the river Draw, which bounds the emperor's dominions, they come into a desert that does not afford one drop of water for twenty days, till they arrive at a fortification, in which there is a Moorish governor, and about an hundred men; so that of every two camels, one carries water; and besides, there is a spare one for every load. These camels will live eight days without water, and five days without victuals; so that they are extremely useful in travelling over these hot countries.

In some of these deserts that are habitable, the people live wholly on their camels; their tents and cloaths are made of their hair; so are their beds; and their shoes are made of their skins, which consist only of a sole, and some small straps of leather crossed on the foot, and sewed together very ingeniously.

They trade into Guiney with salt, and woollen cloth, which they purchase from the English. The salt, however, is the chief commodity, and most of it is used in rubbing their lips, which would otherwise corrupt with the violence of the heat. Cowreys, another branch of commerce, are little shells, brought from the East Indies, and in some parts of the empire they pass for coin, but especially among the blacks. In return for these articles thus exported, or rather carried in caravans out of the country, they bring home gold dust, elephants teeth, ostriches feathers, and negroes, who are the emperor's property; and the journey is generally performed in about six months.

The method of trading in some of these places is very extraordinary, for they do not see the persons they trade with, but, passing over a little river, leave their salt at the accustomed place, in a pot or jar, and then they retire. In the mean time, the people take away the salt, and put into the pot or jar as much as they think it is worth; which if the Moors approve of, they retire with it; otherwise they set the pot on one edge, and leave it; and afterwards, upon their return, either find more gold, or the salt in the place where it was before.

But the emperor of Morocco was such a tyrant, that no manner of trade or commerce could flourish under his arbitrary government; for no sooner was a man reputed to be rich, than he ordered the whole of his property to be seized on, and this one of the reasons, and perhaps the principal one, why the people who have any, endeavour industriously to conceal it from the rapacious hands of those officers who are sent to rob them under the pretended sanction of legal authority. In former times, some of the merchants of Tetuan traded to a considerable extent; but when Muley Ishmael came to the throne, they retired from business, thinking by that to get off quietly with what they were in possession of, but being reputed to be people who had considerable fortunes, they were fleeced of every thing they had in the world, and those who were suspected of having concealed any part of their

their substance, were sold as slaves. Many of these unhappy people were left to starve; and it was no uncommon thing to see some, who had acquired thousands by their honest industry, begging for bread in the streets. No day passed without some rage or other being committed upon the unhappy sufferers, particularly at Fez, where the people once imprudently refused to comply with the emperor's exorbitant demands, for which some thousands of them were put to death.

One of the first acts in this emperor's reign, was to order search to be made into all, that a discovery might be made of such as were descended from slaves or renagadoes; and here it may be proper to observe, that by renagadoes is meant, all those Christians, whether Greeks, Roman Catholics, or Protestants, who have embraced the religion of Mahomet. In conducting this enquiry, many cruelties were committed, and thousands of poor people, either from motives of private pique, or a public spirit of revenge, were declared slaves, their persons and estates seized for the use of the emperor, and some of them were put to the torture, to make them declare themselves to be slaves, although many of their ancestors had lived in great reputation.

This inhumanity extended all over the empire, till the merciless officers came to Fez, the greatest, richest, and at that time the most powerful city in the empire. The inhabitants shut their gates against the officers, and sent them back to the emperor, declaring, that if their lives were demanded, they would cheerfully part with them, but they would never part with their liberties, so he ordered them to pay one hundred pounds weight of plate, but gave over troubling them for the future, though he bore them a mortal grudge.

It is impossible to express the cruelties this emperor inflicted on his people, for nothing was more common, than for him to send for some of the richest merchants; and when he imagined they concealed their property, he put them to the torture, to make them discover where it was. These projects he frequently resumed, and it appeared evident to the more thinking part of his people, that his design was to make slaves of all his subjects. Indeed it may be said he did so, for he had all their lives in his power, and could put them to death whenever he pleased.

The naval force of this empire is very inconsiderable, notwithstanding the vast number of Christian slaves they have taken, there not being a good port belonging to the whole country; neither are they capable of building or fitting out many ships. It is true, they can put a great number of men on board their armed vessels, but numbers are of little service without regular and severe discipline, and, probably it is owing to this that these barbarians never take any European ships beyond the size of our common merchantmen.

Marmora and Sallee, so much noted for their rovers or piratical privateers, are the best ports in the country; but by reason of a bar, which lies all along the

coast, ships of the smallest draught are obliged to unload and take out their guns, before they can get into the harbour. At Sallee there are three docks for building ships, but they are seldom used, on account of the ignorance of the people, and the want of materials to construct them.

The inhabitants of Fez were very rich and flourishing, but partaking of the same fate with the rest of the country, are now become little better than slaves to their barbarous governors, at whose command they are liable to be tortured till they have given up all their wealth; and when the possession of it draws on them such misery, it is no wonder they neglect the means to attain it, and suffer their trade and commerce to fall to decay, by reason of which their glory is abated, their public buildings are fallen to the ground; and they who saw the city in its antient splendor, lament its present state.

Before we conclude this article, it will be necessary to lay down some rules for the conduct of those who may have occasion to travel into the empire of Morocco. This is the more necessary, because the neglect of such things, may lead them into a great number of difficulties.

The first thing they are to do after their arrival, is to make themselves known to the governor, and give him a handsome present, according to the custom of the country, and they must repeat their visits as often as they can possibly. When they have any differences either with the Moors or Jews, they must make their complaints known to him, because, in such cases, the basha or governor-general levies severe fines upon the aggressors. They must do all they can to make friends with the upper servants belonging to the basha, and they must be very liberal to his kinsmen; they must speak respectfully to the Moors, although it may happen that they may receive abusive language from them. They must never go from one town to another without licence of the governor, otherwise he will become their most implacable enemy. They must never trust either Moors or Jews with their goods, unless they receive sufficient security for their being restored.

The merchants are particularly requested not to make themselves too familiar with the slaves, lest in the end it may turn to their own disadvantage; for there is such a jealousy subsists among these Moors, that when they see a Christian speaking to a slave, they foolishly imagine that he is going to take him away in a clandestine manner. In all other cases, both merchants and travellers ought to behave with great prudence and circumspection. They should consider that they are trading, as it were, on enchanted ground; and they should lay such a restraint on their passions; as to prevent them from running into any sort of extravagancies: these things being attended to, a person may travel in safety through the whole empire of Morocco; and as most of our young men who visit that country, have a sufficient flow of spirits, so they will be the more enabled to surmount difficulties.

TRAVELS THROUGH AMERICA.

By Father CHARLEVOIX, Professor KALM, CARVER, and others.

THE discovery of the vast continent of America, is one of those wonderful events which displays to us a Divine Providence, and points out to us the truth of the words of the inspired penman, "Surely there is a spirit in man, and the inspiration of the Almighty giveth him understanding." When most of the inhabitants of Europe were either engaged in destroying each other, or lost in bigotry and superstition, a private person made such progress in his studies and experiments, that he actually discovered a new world, the bounds of which are not yet particularly known.

Christopher Columbus, a native of Genoa, found, that according to the real form of the earth, there must

be a continent to the westward, and, with a boldness peculiar to himself, he proposed sailing towards it. He disclosed the scheme to his countrymen; but they rejected it as an idle chimera, that could never be reduced to practice. He sent his brother over to England with the same proposals, which the Spaniards at last accepted; but as we have already taken notice of this affair in the beginning of this work, we shall not say more concerning it, but proceed to give an account of the observations made by those gentlemen mentioned above.

Father Charlevoix, a learned jesuit, was sent by order of the French king to visit the extensive province

NORTH AMERICA

of Canada; and it must be acknowledged, that the account he has given us of that very extensive part of the continent of the new world, is far superior to any thing of the kind that we have. It is true, some farther discoveries have been made, but these will be taken notice of afterwards, although even the journal of father Charlevoix is but as of yesterday to a historian. His remarks on the manners of the people are just, his description of places are ingenious; and in his accounts of public transactions, he is generally accurate. Endowed with a lively imagination and abilities, to investigate every thing that presented itself to his view, he penetrated far into the country, and transmitted to France many curious particulars, that had either been overlooked, or not properly understood by those travellers who went before him.

This gentleman sailed from France in 1720, and begins his account of Canada with a description of the great river of St. Laurence. This river (says he) as high as the island of Orleans, which is upwards of three hundred miles from the sea, is never less than four or five leagues in breadth; but above this island it becomes suddenly narrow, and that at such a rate, that at Quebec it is only a mile across; from this circumstance, this place has been called Quebeic or Quebec, which signifies a strait or narrowing,

The first object that presented itself to our view, was a fine piece of water, about thirty feet in breadth, situated close by the channel of the Isle of Orleans, and is seen at a great distance from the south-side of the river. A person would naturally imagine, that such a plentiful fall of water, and which never dries up, must proceed from some river; but, however, its source is no more than a small stream, in which, in some places, there is hardly water up to the ankle, but it flows constantly, for it derives its source from a pleasant lake, about forty miles distant. This cascade is called the Fall of Montmorency, in memory of the great admiral of that name.

The city stands a league higher on the same side, and where the river is narrowest; but between it and Orleans, is a basin, a league over, into which the little river St. Charles, flowing from the north-west, empties itself. Quebec stands near the mouth of this river, and Cape Diamond, which projects into St. Laurence. The place for anchoring is opposite to it, in twenty-five fathom water; and shipping are seldom in danger, though they may happen to be driven from their anchors.

When Samuel Champlain founded this city in 1608, the tide usually rose to the foot of the rock; but since that time it has returned by little and little, and at last left dry a large piece of ground, on which the lower town has been since built, and which is now sufficiently elevated above the edge of the water, to secure the inhabitants against the inundations of the river.

The first thing we met with on landing, was a pretty large square, but not built in a regular manner. The fronts of the houses were regularly built, but the backs of them leaned against the rock, so that they had no great depth. Here is formed a street of considerable length, covering the whole breadth of the square, and extending on the right and left as far as the two ways that lead to the upper town; and the square is bounded towards the left by a small church, and to the right by some houses. There is also another street between the church and the harbour; and at the turning of the river, near Cape Diamond, there is another row of mean houses, where the most ordinary sort of people reside. This may properly be called the suburbs, because it is within the walls, as the greatest part of the lower town is.

In going up to the higher part of this city, the ascent is so steep, that they have been under the necessity of cutting steps in the rock, so that it is impossible to ascend it but on foot. But in going from the square, towards the right hand way, a proper road has been made for their horses to go up with their burdens. At the place where these two roads meet, begins that part of the upper city which faces the river, there being a suburb adjoining to the little river St. Charles.

The first building in the upper town that attracted our notice was the bishop's, a plain neat structure, but no way magnificent. A little beyond it we found two pretty good squares, in one of which the governor-general resides, and here the courts of justice are held. On the opposite side of the governor's palace, stands a convent for the Recollects, and the other side of the square is lined with handsome houses.

In the square towards the right, we came first towards the cathedral, which serves for a parish church for the whole city. Very near to the cathedral is a seminary or school for the education of youth; and opposite to the cathedral is the Jesuits college, having some very handsome houses adjoining to it. On the descent towards the upper town, is the house of God, or hospital for the sick; and near it are a great number of small houses. On the other side of the Jesuits college, where their church stands, is a pretty long street, in which is the convent of the Ursuline nuns, which has nothing in it very remarkable. The whole of the upper town is built on a bottom, partly marble, and partly slate.

The church of the lower town is dedicated to the blessed Virgin, and serves as a chapel of ease for those of the inhabitants. The whole of the structure is neat, but exceeding plain, which seems to point out the frugality of the first settlers. Near this church is a school, where some of the nuns instruct the young women gratis. The plan of the episcopal palace is magnificent enough, but very little of it besides the chapel and the bishop's apartments have ever been finished. If it is ever completed it will be a most magnificent edifice; for the gardens extend to the brow of the rock, and command the prospect of the river.

The cathedral would make as an indifferent appearance as one of the parish churches in France, even in a small village; but then places and circumstances must be considered: the colony, though settled a considerable time, is yet little better than in a state of infancy; and it will require a considerable time to bring it to a state of perfection. Architecture is seldom encouraged, and consequently not cultivated but in opulent nations; and Canada being at a vast distance from Europe, its best interests are neglected, and the people are left to their own discretion to raise what structures they please. The principal object worth notice, belonging to the cathedral, is a high tower, which at a distance has no bad effect. The school adjoining to the church is a large square, the buildings of which are not yet finished, but what is already completed is well executed, and has all the conveniency necessary in this country: from the garden there is a prospect of the river, as far as the eye can discern any objects.

The front, or citadel, is a fine building, with two wings in the form of pavilions; but there is no going to it, being built on the rock. This defect is supplied, in some measure, with a beautiful gallery, and a balcony which reaches the whole length of the building: it commands the road, to the middle of which one may be heard by means of a speaking trumpet; and the lower town appeared as if just under our feet. The prospect from here is almost unbounded, and ravishing to the eye of the beholder: the air is pure, and, upon the whole, the situation is as delightful as could be imagined to take place in such a northern climate.

The church belonging to the Catholics is a fine edifice, and would make no contemptible figure in Paris. It is very neatly wainscotted, and adorned with a gallery, which however is rather heavy than elegant. In a word, nothing is wanting to make it complete but the taking away some of the paintings, which are daubed over in the coarsest manner that can be imagined. Their house is large and commodious, and adorned with a spacious and well-cultivated garden. From this garden the fathers have an extensive prospect, not only over the river, but likewise the country adjoining; and they may, if their passions are properly subdued and kept under restraint, enjoy more happiness in their minds and in their consciences than ever was known by sovereign princes.

The Jesuits church has nothing in it worth notice, but on the outside there is a very good steeple and spire: it is entirely roofed with slate, and is the only structure in Canada favoured with this advantage: the inside is well ornamented; and the gallery is light, and well wrought: it is surrounded by an iron ballustrade, painted and gilt, and of excellent workmanship: the pulpit is gilt all over, and the work, both in iron and wood, excellent: there are three altars well finished, having some good paintings, but it has not any dome in the middle: instead of being paved with stone, it is floored with wood, which makes it warm and agreeable in winter; whereas in the other churches the people are almost perished with cold.

The house of God, or the hospital for the sick and lame, has two large wards, one for the men, and one for the women. The beds here are kept exceeding clean, the sick are well attended, and every thing is commodious and extremely neat. The church stands behind the womens ward, and has nothing worth notice except the great altar. The patients are attended by the nuns of St. Augustine, of the congregation of the Mercy of Jesus; the first of whom came originally from Dieppe. They have, at a great expence, built themselves an apartment to reside in; and, as it is situated about half way down the hill, the prospect from it is extensive and delightful.

The intendant's house, already mentioned, is called the palace; because the general council, according to the French laws, is held here. It is a neat structure, built in the form of a pavilion, the two extremities of which project some feet, and to which we ascended by a flight of stairs. The garden front, which faces the little river, is more agreeable than that by which we entered. The king's magazines were opposite the court on the right side, and behind that building is the prison.

The gate by which we entered is hid by the mountain on which the upper town stands; and this side affords no prospect except that of a steep rock, extremely disagreeable to the sight. Here we went on a little way into the fields, and about the distance of a mile came to the General Hospital. This is the finest house in all Canada, and would not dishonour one of the largest cities in France. The fathers Recollects formerly owned the ground upon which this structure is built, but M. D. St. Vallier, bishop of Quebec, removed them into the city, bought their settlement, and expended one hundred thousand crowns in buildings, furniture, and in making a proper settlement for the support of it. The only fault attending this hospital is its being built in a marshy ground; and though they have made several attempts to drain off the water, yet all to no purpose, for the little river St. Charles continually supplies it by its overflowings.

This munificent and charitable prelate did not reside in his own apartments, but took a private room, and gave the whole of his palace to the poor nuns. Such was his humility, that he frequently served as chaplain to the hospital; the duties of which office he discharged with great zeal and application, so as to do more than a single priest would have done, had he even got his living by it. The honest artizans who are past their labour, are received into this hospital till all the beds are full; and there they continue the rest of their days: they are attended by thirty nuns, who are all of good families, and wear silver crosses on their breasts.

Quebec is strongly fortified, and it has always been found extremely difficult to take it. The harbour is flanked by two bastions, which, in high tide, are almost level with the surface of the water; that is, they are elevated twenty-five feet from the ground; for so high do the tides flow in the time of the equinox. A little above the bastion, on the right, has been built a half bastion, which is cut out of the rock; and a little higher, on the side towards the gallery of the fort, is a battery of twenty-five pieces of cannon. Higher still is a small square fort, called the citadel, and the ways which communicate from one fortification to another are extremely steep.

To the left of the harbour, quite along the road, as far as the river St. Charles, are good batteries of cannon with several mortars.

From the angles of the citadel which parts the city, has been lately built an oreillon of a bastion, at right angles, which communicates with a very elevated cavalier, on which stands a wind-mill, fortified. About a musket shot below this cavalier there is a fortified tower, with a bastion; and at the same distance from this is a second, fortified in the same manner. The original design was to line all this with stone, which was to have had the same angles with the bastions, and to have terminated at the extremity of the rock, opposite to the palace, where one redoubt has been built, as well as on Cape Diamond. In 1711, the English sent a fleet to attack Quebec; but the admiral refusing to be directed by the pilot, lost several of his largest ships, and above two thousand men.

Having said thus much of the exterior part of Quebec, we shall now take some notice of its inhabitants and civil government, with the different officers appointed to keep the peace and administer justice.

There are in this city, in general, about eight or nine thousand inhabitants; and, as there are some families of distinction, so nothing is wanting to make the place chearful and agreeable. The first officer is the governor general, who has under him a major, who is the commandant of the city. Next to the major is the intendant, who sits in the superior council, and collects the revenues for the crown. The next is the commissary of marines; a grand provost; and a surveyor of the highways; with a grand master of the waters and forests, whose jurisdiction is very extensive. Here are also a great number of rich merchants, a bishop, and a well regulated seminary of priests and students, the order of Recollects, the Jesuits, three communities of women well educated, all under the direction of a lady intendant, and several brilliant assemblies. They do every thing in their power to make the time pass away agreeably, and to live in chearful ease and elegance. They play at cards, or go abroad on parties of pleasure in the summer in calashes, or if on the water, in canoes. In winter they go in sledges over the snow, or on the ice with skaits. Hunting is in great respect among them, and they, in some cases, have no other ways of procuring a subsistence. They have no news-papers but what are sent them from Europe; but as many of those come at one time, so it affords them sufficient matter for conversation: they reason like politicians on what is past, and form conjectures on what is likely to happen. The sciences and fine arts have also their part, so that the conversation is with them almost as lively as in Europe.

The inhabitants of Canada, descended from the Europeans, draw in the seeds of liberty with their breath, which renders them very agreeable in all the arts of commerce; for without liberty commerce will never flourish. The present language is spoken in great purity, and there is not the least tincture of a foreign accent to be found in their pronunciation. We met with no rich men in the country, but with many who would wish to be esteemed so. They are as expensive as their circumstances will permit, and if they can procure fine cloaths, they think themselves superior to all sorts of wants. They are generally well made, many of both sexes having very good complexions. They are gay and sprightly in their behaviour; and politeness of carriage, with sweetness of manners, seem to be peculiar to them. Their poverty is concealed by an easy air, that makes even indigence appear graceful.

Having seen every thing worthy of notice in Quebec, we set sail down the river; but had not proceeded far when we found our vessel so leaky, that it began to fill with-water. This obliged us to land at a village belonging to the warlike tribe of Indians called Hurons, some of whom are courteous, and have a chapel built in a plain neat manner. A wilder place than this could not have been thought of for the situation of a mission to convert the Indians. And yet we made a vast number of converts; for no sooner did we begin

begin to converse with them, than they listened to us with the utmost attention, declaring that they felt a secret dread upon their minds. But the solid piety of the inhabitants of this desert makes an impression upon all, which is so much the greater, as it is assisted by thought and reflection.

The inhabitants are all what we call savages, and they derive nothing from their birth and original but what is really estimable, namely the simplicity of the first ages of the world, together with those improvements which grace has made upon them, a patriarchal faith, a sincere piety, that rectitude and docility of heart which constitute a true saint, great innocence of manners, and, lastly, pure religion, which is yet unknown in many parts of Canada.

Nothing can be more affecting than to hear them sing in two choirs, the men on one side, and the women on the other; and these are the prayers and hymns of the church in their own language. Nor is there any thing to be compared to that fervour and modesty which they display in all their religious exercises; and we may safely declare, we never saw any of them who were not, to outward appearance, touched with a fervour of true devotion.

This village had been much better peopled some years before we visited it; but the small-pox, first brought amongst the inhabitants by the French, had greatly reduced the inhabitants. The heathen Indians considered the small-pox as the effect of witchcraft; and one father Sebirt, who belonged to our mission, having baptized a child belonging to a savage, the infant was soon after seized with that distemper. The father of the child imagining that the small-pox had come in baptism, vowed revenge against the priest; and one day, when the father Sebirt went to his house, the old savage clapped a collar round his neck, and drew it over a cross beam to strangle him. The priest would certainly have been hanged, had not the collar of his cassock prevented the effects of the rope; which the Indian observing, let him fall to the ground, and ran to fetch his hatchet to cleave his skull. In the mean time the priest took to his heels, and the Indian pursued him nine miles, but did not overtake him, for he got on board a Dutch vessel in the river, and happily joined our company.

There was one thing that greatly retarded our operations in converting these heathens, and that was, the Dutch having from time to time sold them vast quantities of spirituous liquors. The excessive coldness of the climate induced them to drink these to excess, which frequently reduced them to a state of madness; so that had we attempted to speak to them, we should have been in danger of having their hatchets sent through our skulls; and to this we may add, that when we converted any of them, they were so obnoxious to those who remained in a state of heathenism, that they would have been knocked on the head, had they remained amongst them.

What we have now mentioned is a great hardship to the missionary, because he is often at a loss how to support his flock; for as they are driven out from the rest of their countrymen, consequently they are deprived of a subsistence. Sometimes, however, Providence interposed to second our designs; for while we were there, Mr. and Madam Begon, who were of our pilgrimage, laid out great sums of money to supply them with many of the necessaries of life. They treated Mr. and Mrs. Begon with an entertainment in their own way, consisting of rustic dances and barbarous music, and this was followed by a grand entertainment, at the expence of these worthy persons. The men, according to the custom of the country, eat in one house, and the women in another, accompanied by the young children. Their apartments are no more than cabins, made of boughs and reeds, for the Indians are utterly unacquainted with the art of building houses as in Europe.

The women on such occasions testify their gratitude only by their silence and modesty; but because Mrs. Begon was the first lady in the colony who had ever

regaled the whole village, an orator was appointed to deliver an oration in praise of these persons, and by his mouth were displayed all the grateful sentiments of their hearts towards their illustrious benefactress. As for the men, after their chief had made an oration to the intendant, he danced and sung till he was tired. Nothing can be more entertaining than these songs, and the manner in which they are sung gives us a lively idea of antient manners and customs, long before the refinements of society had taught men luxury, enervated their constitutions, and laid the foundation of crimes.

At first they seat themselves on the ground, like so many animals, without any sort of order; then one rises, from time to time, and advances slowly to the middle of the place, which, for forms sake, may be called the theatre. He turns his head from one side to the other, singing an air in their own barbarous jargon, which none understands but themselves. Sometimes it is what they call a war song, and sometimes the dreadful death song. They have no songs over their cups, like our Europeans; and for their amours, they conduct them very quietly, without any sort of music at all. Whilst this person is singing, the pit, or audience, never cease beating time, in order that they may, like our critics, remark upon the performance.

As soon as one person has given over, another takes his place; and this continues till the spectators have thanked them for the entertainment, which they would not be a long while in doing, were it not convenient to shew somewhat of complaisance to those people. Their music is the most disagreeable that a European can form any notion of; but it is quite different with them when they go to church, the women particularly having a surprising justness of voice, and at the same time a considerable share of taste, as well as a quick genius.

On such occasions the harangue, or oration, is well worth attending to. They explain in a few words, and almost always in a very ingenious manner, the occasion of the festival, which they never fail to ascribe to very generous motives. The praises of him who is at the expence are not forgotten, and they sometimes take the opportunity when certain personages, particularly the governor and other civil officers are present, to ask a favour, or to represent their grievances. The orator for the Huron women, whom we have already mentioned, said that day, in his harangue, some things so very extraordinary, that we began to suspect that the interpreter had lent him some assistance; but he protested he had added nothing of his own, which we believed, because we knew him to be one of the most sincere men in the world.

Before we made this little excursion, we had visited some other places adjoining to Quebec, but as the ground was then covered with snow five or six feet deep, we could not say much of the face of the country. However, it being now spring, we found it abounding with all the necessaries, as well as comforts of life. It is a complaint, as old as the colony itself, that Canada will never enrich its European proprietors; and we shall here endeavour to investigate the truth of this, because it may serve to remove some prejudices which many people have run into.

The original source of the misfortune of this province was the report that had been spread in France, that there were no mines in Canada. Avarice promotes colonization; but when the object sought after is not found, then the colony falls to decay, in consequence of the avaritious adventurers having neglected it. But even allowing there were no mines in this colony, yet there are some other things far superior to gold or silver, and which, by encouraging industry, would become a source of wealth if cultivated, without seeking to become rich too soon. The articles we allude to are the fishery and the fur trade. The former would at all times nourish a sufficient number of seamen to man a royal navy, and the latter would become a sale article of commerce, the property of

one European nation, but disseminated among all the others. It is well known that all the gold and silver of Mexico and Peru has not made the Spaniards rich, for on the contrary it has totally enfeebled them, and rendered them in a manner so inactive, that they are despised all over Europe. And what is all this owing to? Here the aid of political knowledge must be called in to our assistance.

The importation of such articles into any countries, as raw materials, must find work for an industrious people; but silver and gold, which are only emblems of riches, make people forget labour, and sink down into a state of idleness; while the poor, and the more useful members of society, are left to starve. Riches flow from the industry of the people, from the encouragement given to the honest labourer; but idleness is the effect of money acquired without toil. But we hope the propriety of these remarks will appear to the unprejudiced reader; this much is certain, that they are the result of experience; so that we shall go on with our subject.

The cod fishery had been carried on near the banks of Newfoundland, before the river St. Laurence was much known; but the English made a settlement there before the French had an opportunity of doing so. At last the French got possession of the harbour and bay of Placentia, where their squadrons lay frequently at anchor. For many years the French annoyed the trade of the English in that place, but generally the latter were victorious. In this the French were assisted by the Canadians, whom they first taught to scalp their prisoners. This barbarous custom is now in so much vogue, that the Indians think themselves men of honour, if they can only lay hold of a prisoner, and cut off his scalp. It is in vain to attempt to throw the odium of this upon any particular nation; all those concerned in the dispute have had their share in it; and policy, as is common in such cases, has triumphed over humanity. We have (says this French author) behaved much worse to the Canadians than we ought to have done, because we suffered our governors to fleece those poor people of the greatest part of their substance. To this may be added, that we did not improve their services in a proper manner, which would have been an inexhaustible fund of wealth, and a treasury for our navy, and at the same time have brought in vast sums of money to the country by the sale of these articles in Europe.

But the principal trade of this colony at present, and indeed for many years past, is that of furs, or beaver-skins; but the errors committed by the French were innumerable. Perhaps their national character never shewed itself in a stronger light than in this. When they first settled in Canada, there were in it vast numbers of wild beasts; but so rapacious were the French, that even some of the species of these creatures is now extinct. They killed the elks and mouse deer merely for the sake of amusement, and to shew their dexterity. They had not even the prudence to call in the aid of the civil power to rectify these disorders.

But the greatest mischiefs arose from the insatiable avidity of private persons, who applied themselves solely to this commerce. They arrived for the most part from France, with nothing except what they had on their backs, and this made them impatient to appear in a better situation. At first this was an easy matter, for the Indians knew not what riches were contained in their woods, till the rapaciousness with which their furs were bought up, made them acquainted with it. Prodigious quantities were got from them for trifles, which many would not have been at the trouble to gather together. Ever since they have had their eyes open with respect to this commodity, and have acquired a taste for something more solid; for it was for a long time very easy to satisfy them. At a small expence, and with a little prudence, this trade might have been carried on, and continued, on a tolerable footing.

The beaver was not unknown in Europe before

the discovery of America, for in the records of the parliament of Paris, there are regulations concerning the manufacture of beaver hats. Now the beaver of Europe and America are absolutely one and the same animal; but the European ones are now become very scarce, for none of our naturalists have mentioned it as an European animal. But however that be, the beaver of Canada is an amphibious quadruped, which cannot live for any long time in the water, and which is able to live entirely out of it, provided it hath sometimes the convenience of bathing itself.

The largest beavers are somewhat less than four feet in length, and fifteen inches in the breadth over the haunches, weighing about sixty pounds. The colour is different, according to the climate in which it is found. In the northern parts they are generally black, though there have been found some entirely white. In the more temperate parts they are brown, their colour becoming gradually lighter, till they come more to the south. In the country of the Illinois they are almost yellow, and some are of a straw colour. It has also been observed, that in proportion as their colour is lighter, they yield a less quantity of fur, and consequently are less valuable. This is plainly the work of Providence, which screens them from the cold in proportion as they are exposed to it.

The fur is of two sorts all over the body, excepting at the feet, where it is short. In general it is about an inch in length, but sometimes on the back it is two inches, diminishing gradually towards the head and the tail. This part of the fur is harsh, coarse, and shining, and is properly that which gives the animal its colour. The other parts of the fur is a very thick and fine down, of an inch in length at most, and is what is commonly manufactured. In Europe it was formerly known by the name of Muscovy wool; and this is properly the coat of the animal.

The beaver does not live above eight or ten years, and the female has generally four at a litter; she has four teats, two of them being higher than the others. The head of a beaver is very much like that of a mountain rat; its snout is pretty long, the eyes little, the ears short, round, hairy on the outside, and smooth within. Its legs are short, particularly the fore legs, which are only four or five inches long, and pretty much like those of the badger. The nails are hollow like quills, but the hind feet are quite different, being flat, and furnished with membranes, or webs, between their toes. Thus the beaver can walk, though but slowly, and swim as well as any other amphibious animal. The most remarkable thing in this animal is the tail, which is almost oval, four inches broad at the root, five in the middle, and three at the extremity. It is covered with a skin full of scales, which rest upon each other like those of fishes.

The winter never surprizes the beavers, for their works, which we shall presently mention, are finished by the end of September, when every one lays in his winter stock of provisions. The first things these ingenious animals do, when they want to change a habitation, is to call a parliament, or rather a meeting of all the families in the province. However, this much is certain, that there are frequently three or four hundred of them together in one place, building a town, which in some respects might be called a little Venice. First of all they pitch upon a spot where there are plenty of provisions, with all the materials necessary for building. Above all things water is absolutely necessary, and in case they can find neither lake nor pool, they supply that defect by stopping the course of some rivulet by means of a dyke, or to speak in the language of this country, a causeway.

For this purpose they set about felling of trees, but higher than the place where they intend to build; three or four beavers place themselves round, and continue gnawing it with their teeth till it falls to the ground. But this is not all, for they take their measures so well, that it always falls towards the water, to the end they may have less space to drag it, after cutting

cutting it into proper lengths. They have afterwards only to roll those pieces, so cut, towards the water, where, after they have been launched, they navigate them towards the place where they are to build.

These pieces of wood are more or less thick or long, according as the nature and situation of the place requires; for these architects foresee every thing. Sometimes they make use of the trunks of great trees, which they place in a flat direction; frequently the streets of these their little towns are made of pieces of wood as thick as a man's thigh, supported by strong stakes, and interwoven with small branches; and every-where the intermediate spaces are filled with a fat earth, so well applied that not a drop of water passes through. The beavers prepare this earth with their feet, and their tail not only serves them instead of a trowel for building, but also serves them instead of a wheel-barrow, for carrying the mortar, which is performed by trailing themselves along on their hinder feet; when they are arrived at the water side, they take it up with their teeth, and apply it first with their feet, and then plaster it with their tails. The foundations of these dykes are commonly ten or twelve feet thick, but as they reach upwards they diminish, till they come to about two or three feet. The strictest rules of proportion are always observed, and the side towards the current of the water is always made sloping, and the other side quite upright. In a word, it would be difficult for our best workmen to build any thing more solid or regular.

The construction of their cabins is no less wonderful; they are generally built on piles in the middle of these small lakes formed by the dykes; sometimes on the bank of a river, or at the extremity of some point advancing into the water. Their figure is either round or oval, and their roofs are arched like the bottom of a basket. Their partitions are two feet thick, the materials of them being the same, though less substantial, than those in the causeways; and all is so well plastered with clay in the inside, that not the smallest breath of air can enter. Two thirds of the edifice stands above water, and in this part each beaver has his place assigned him, which he takes care to floor with leaves, or small branches of pine-trees. There is never any filth to be seen here; and to answer such a salutary purpose, besides the common gate of the cabin, and another opening by which these animals go out to bathe, there are several openings, by which they discharge their excrements into the water. The common cabins lodge about eight or ten beavers, and some have more; but this is seldom. All of them are near enough to have an easy connection with each other.

When their business leads them abroad into the country or woods, they live upon the fruit, bark, and leaves of trees; and they catch a great number of small fishes. But that they may shew themselves to be the most industrious animals in the world, they provide for their subsistence during the winter in the following manner. They gather together small branches of aspens, poplars, and such other wood as is most agreeable to their taste; which they lay up in piles, and dispose in such wise, as to be always able to come at the pieces which have been softened in the water. It has been constantly remarked that these piles are more or less large, according as the winter is to be longer or shorter, which serves as an almanack to the Indians; who are never mistaken with respect to the duration of the cold. The beavers, before they eat the wood, cut it into small pieces, and carry them into their apartments, each cabin having only one store room for the whole family.

When the melting of the snow is at its greatest height, as it never fails to occasion new inundations, the beavers quit their cabins, which are no longer habitable, every one shifting for himself as well as he can. The families return thither as soon as the waters are fallen, and it is then that they bring forth their young. The males keep abroad till towards July, when they re-assemble, in order to repair the

breaches which the swelling of the water may have made in their cabins or dykes. In case these have been destroyed by the hunters, or if they are not worth the trouble of repairing, they set about building of others, but they are often obliged to change the place of their abode, and that for many reasons. The most common is for want of provisions, and sometimes they are driven out by the hunters, or by carnivorous animals; against whom they have no other defence than flight alone. One might reasonably wonder that the author of nature should have given a less share of strength to the most part of useful animals than to such as are not so; if this very thing did not make a brighter display of his power and wisdom, in causing the former, notwithstanding their weakness, to multiply much faster than the latter.

There are some places to which the beavers seem to have so strong a liking that they can never leave them, although continually distressed in them. On the way from Montreal to Lake Huron, near the centre of the great river, is constantly found every year a nest, which those animals build or repair in the summer: for the first thing which those travellers who arrive earliest do, is to break down the cabin and dyke which supplies it with water. Had not this causeway been dammed up, the water there would not have been sufficient to have enabled them to continue their voyages, so that of necessity there must have been a carrying place, therefore it seems those good-natured beavers post themselves there for the convenience of passengers.

The vast sagacity of these creatures induced the Indians to believe that they were a species of animals endowed with rational faculties; that they had a language peculiar to themselves, and a form of regal government; that they chose their magistrates, who planted centinels to give notice of the approach of an enemy; and that they drove the lazy as exiles out of the community. They believed farther, that those officers gave every one the appointment to what work he was to do, and rewarded or punished him accordingly. And pray may we not ask, what is surprising in all this? These heathens know nothing of divine revelation, so that they might naturally, though erroneously, imagine that the beavers had rational souls.

It is generally supposed that those who are driven out of the community, are what is commonly land beavers, who actually live separate from the others, never work, but live under ground, and make themselves a covered way to the water. They are known by the small quantity of fur on their backs; proceeding, without doubt, from their rubbing themselves continually against the ground; and besides they are lean, which is the consequence of their laziness, and they are most numerous in warm climates.

It appears that the Indians in Canada did not disturb these industrious animals till the arrival of the Europeans. The skins of the beavers were not used by those people by way of ornaments, nor as garments, to screen them from the cold; nor was their flesh eaten by them. They were, however, inured to hunt them; and this hunting had both its season and ceremonial fixed: but this was for diversion, not for profit. This was the reason why there were so many of those creatures in Canada when the French first settled in that country: but their numbers are now greatly diminished.

The hunting of the beaver is not difficult; for this animal does not exert so much strength in defending himself, or dexterity in evading the lances of his enemies, as he discovers industry in providing himself good lodgings, and foresight in getting all the necessaries of life. It is during the winter that war is carried on against him in form, that is to say, from the beginning of November to the month of April: at that time, like most other animals, he has the greatest quantity of fur, and his skin is thinnest. This hunting is performed four ways; with nets, by lying upon the watch, by opening the ice, and by traps. The first and third are generally joined together: the second

cond is seldom practised; for the eyes of this little animal being so sharp, and its hearing so acute, it is difficult to get within shot of it before it gets into the water, or at least near the water-side, from which it never goes far at this time of the year, and into which it dives the moment it considers itself in danger. It would even be lost after being wounded, in case it could reach the water; for when mortally wounded it never comes up again. The two last methods are most commonly practised; and it is by the use of these that the French, as well as the Canadians, catch such a vast number of those animals; whose industry intitles them to a better fate.

Though the beavers lay up their winter provisions, yet, when the weather will permit, they make frequent excursions into the country, in quest of fresher and more tender food; which delicacy of theirs sometimes costs them their lives. The Indians lay traps in their way, in the form of the figure 4; and for a bait, place small bits of tender wood, newly cut. The beaver no sooner touches it than a large log falls upon his body, which breaks his back; when the hunter coming up, easily dispatches him. The method by opening the ice requires more precaution, and is done in the following manner; when the ice is only about half a foot in thickness, an opening is made with a hatchet, and thither the beaver goes for a supply of fresh air: the hunters watch for them at the hole, and pierce them coming, at a great distance; their breath causing a considerable motion in the water; and thus it is easy to knock them on the head the moment they make their appearance. In order to make sure of their game, and to prevent their being perceived by the beavers, they cover the whole with the leaves of reeds, and after that they understand the animal is within reach, they seize him by one of his legs, and dispatch him before he recovers from his consternation.

When their cabins happen to be near some small rivulet, the hunting of the beaver is still more easy. They cut the ice cross-ways, in order to spread a net under it, and they afterwards break down the cabin. The beavers that are within it never fail to make towards the water, where they are taken in the net: but they must not be suffered to remain long in it, for they would very soon extricate themselves by biting the net with their teeth.

Those whose cabins are in the lakes have, at a little distance, a sort of country houses, for the benefit of the air; and in expeditions against these, the huntsman divide themselves into two bodies: one destroys the house in the country, whilst the others falls upon that in the lake. The beavers which are in the last run to the former for shelter, where they find themselves bewildered in a cloud of dust, which has been raised on purpose; and which blinds them so that they are subdued with ease. Lastly, in some places they content themselves with making an opening in their causeways; and by this means the beavers soon find themselves on dry ground, so that they remain without defence; or else they hasten to apply some remedy to the disorder, the cause of which is as yet unknown to them; and as the hunters are ready to receive them, it is rare that they fail, or at least that they miss their prize by returning home empty-handed.

Much more might be said concerning the beavers, but we think we have advanced enough, and which is no more than the truth, to shew what vast wisdom and knowledge the Almighty can communicate to some animals; nay to all animals if he pleases. These little industrious creatures used to live at ease, and follow those employments to which they were directed by instinct, till the curiosity of the Europeans discovered their country, and avarice taught them to make a property of their furs. It is certain that these little creatures have a large share of wisdom or knowledge; but did they know how many thousands of lives have been lost, how many Europeans have cut each other's throats in order to procure their skins and fur, they would cer-

tainly have long since fleeced themselves. But we shall now proceed to another part of our journey.

Leaving Quebec, we set out for the Three Rivers, which is near eighty miles farther up the river St. Lawrence. The first night we lay at Pointe aux Trembles, twenty miles from the capital. This is only a village, but has an exceeding good parish church, being well built; and the inhabitants are civil and obliging. Here are a great number of persons who call themselves lords of manors, because they had grants of lands made them at the time when the French first took possession of the province; for the European princes make no scruple of giving away what is not their own. These landholders are most arbitrary tyrants, and impose such servitudes upon their tenants as borders on downright slavery. These tenants are poor miserable creatures, being obliged to pay so much to their lords, that their laborious industry seldom makes them an adequate recompence. To this may be added what they pay to the civil power, and the tithes to the clergy; all which joined together, leaves them in such an abject state of poverty, that they are real objects of compassion. In vain do they look for redress from the governor, for that officer has it not in his power to grant it them. It cannot be done unless an order comes from the mother country; for the supreme council of Canada was never invested with plenary powers: there were always some restrictions laid upon them; and it is well known that an appeal to the mother country is attended with innumerable difficulties, besides vast expence; and sometimes the Quebeckers find themselves reduced to ruin just at the time, perhaps, when they have obtained a decree to establish the justice of their cause.

We set out from Pointe aux Trembles before day-break, and I rode on a horse blind of one eye, which I afterwards exchanged for a lame one, and this again for one that was broken-winded. In three days we made a shift to travel about fifty miles, and arrived at the house of the Baron Beckancourt, grand master or inspector of the highways of Canada; who would not suffer us to go any farther till we had spent some time with him. This gentleman's seat was at the mouth of a small river, that runs from the south, and its whole course was within his estate, which was also known by his name. This barony, however, was on the opposite side of the river, where a great many Indians were employed in cultivating his lands, and he had a jesuit to instruct them in the principles of the Christian religion.

Baron Beckancourt lived in this desert much in the same manner as the patriarchs did of old, who were not above putting their hands to any thing, and lived in the same state of sobriety as their servants. The profits arising from carrying on a fair trade with the Indians who lived in his neighbourhood, by buying furs at the first hand, was far superior to all the rents he received from his tenants.

The stream that runs throughout his land was formerly called the Stinking River; but as the water was clear, we made all the enquiry we could into the origin of this name. We received many answers, but as many of them were trifling and frivolous, we shall relate the following.

Some Algonquins made war with the Onnontcharonnons, better known by the nation of the Groggnons, and whose antient abode was in the island of Montreal. The name they bear proves that they were originally of the Hurons, although, according to their accounts, the Hurons drove them out from amongst them. However, be this as it will, they were at the time we have been mentioning at war with the Algonquins, who, to put an end to the war they were engaged in, and beginning to be weary of bethought themselves of a stratagem, which succeeded according to their wishes. They took the field by occupying both sides of the little river, now called the river of Beckancourt; they afterwards detached some canoes, the crews of which pretended they were fishing in the river: they knew their enemies were at no great distance,

distance, and made no doubt but they would immediately fall upon the pretended fishers. In short, they soon fell upon them with a large fleet of canoes, when they again counterfeiting fear, took to flight, and gained the banks of the river. They were followed close by the enemy, who made themselves sure of distressing a handful of men; who, to draw them the farther into the snare, made a shew of a panick. This feint succeeded: the pursuers continued to advance, and, as the custom is of those barbarians, making a most horrible shouting, they imagined they had now nothing to do but to launch forth and seize their prey.

At the same instant, a shower of arrows discharging from behind the bushes which lined the river, threw them into confusion, from which they were not suffered to recover. A second discharge, which followed close upon the first, completed the rout. They wanted to fly in their turns, but could make no use of their canoes, which were bored on all sides. They plunged themselves into the river, in hopes of escaping that way, but besides, that most of them were wounded, they found on reaching the shore, the fate they sought to shun, so that no one escaped, the Algonquins neither giving quarter, nor making any prisoners. The nation of the Iroquois have never yet recovered this check; and though some of those Indians have been seen since the arrival of the French in Canada, yet few remains of them are now left. The number of dead bodies which were thrown on shore, created such an intolerable stench, that it has been called the Stinking River ever since.

The Abenquive town of Beauchamcourt was not so populous when we entered the country as it had been formerly; for those who did not chuse to embrace the Christian religion, retired from it. It is certain that the Jesuits did all in their power to civilize those savages; but the Dutch having projected the scheme of selling them vast quantities of spirituous liquors, every attempt was rendered abortive; nay, the French were not wanting in carrying on this pernicious practice, and intoxication was not considered as a crime, in hopes of some emoluments arising from it.

The Jesuit missionary at Beauchamcourt treated us with so much civility, that it was with regret we took leave of him. We beheld his labour with pleasure, and at the same time made many melancholy reflections on the vast number of obstacles that stood in his way towards converting the heathens. The consideration of these things filled our minds with some uneasiness, and we wished that there had been no irregularity in the world; but alas! in looking into the system of human affairs, we found that the passions of princes and statesmen become predominant at the expence of the truth, of justice, religion, and the rights of humanity.

We crossed the river St. Laurence, in order to get to the town, and surely nothing can exceed the pleasantness of the situation. It is built on a sandy declivity, on which there is just ground enough to contain the town, if ever it should come to be large, for at present it is very inconsiderable. It is surrounded with every thing that can render a place at once rich and pleasant; and the river, which is a mile over, waters its foundations. Beyond this we were presented with most beautiful prospects of cultivated lands, extremely fertile, and crowned with all the beauties of the creation. A little below, and on the same side of the river where the town is situated, two other rivers fall into the main stream of St. Laurence, and this is the reason why the town is called Three Rivers.

Above, and almost at an equal distance, begins the lake of St. Peter, which is about ten miles broad, and twenty in length. Thus there is nothing to confine the prospect on that side, and the sun-beams set in the water. This lake, which is no more than a widening of the river, receives several streams into it. It is probable enough, that these rivers have, in a course of years, worn away the low moving earth on which they flowed; and this will appear the more palpable, when we consider the state of the lake St.

Francis, in the mouth of which are several islands, which might have formerly been joined to the continent. Besides, over all the lake, except in the middle of the channel, which is kept at its full depth by the current, there is no failing except in canoes; and there are even some places where large canoes, ever so little loaded, cannot easily pass; but to make some amends, here are large quantities of fish, which are taken in great numbers. Near these rivers they do not reckon above a thousand inhabitants, but they are daily increasing; for the iron mines, which surround the town, have become a vast source of wealth, and have brought many people to settle there. The situation of the place renders it of great importance, and therefore it is no wonder that such respect should have been paid to it by European princes. There are both nuns and monks here, with several churches; most of these are under the direction of the Jesuits. In all other respects, the town is well governed, according to the laws of France; and men may live peaceably in it, who chuse to attend to those duties incumbent on them as members of civil society.

This city owes its origin to the great concourse of Indians of different nations, who frequent this place, especially at the beginning of the first settlement of the colony. Vast numbers of persons resorted to it by means of these rivers, which are navigable a great way up into the country. The situation of the place, joined to the great trade carried on at it, made some French to settle here, and the vicinity of the river Somell induced the governor to build a fort here, where a good garrison is constantly kept. Here the Jesuits did all they could to propagate the Christian religion, but they met with many obstacles. The Indians came down in large bodies, and destroyed the new settlers; so that the French families were obliged to go to a place far below the town, on the banks of the river, which has been since called Cap de la Madelaine, and that name it retains to this day.

The Jesuits did not succeed in this their mission as they could have wished, for their religious arguments did not attract the notice of the heathen savages. These people are dull of apprehension, and therefore it is difficult to make any impression upon them.

We have already taken notice of the manner in which they hunt the poor innocent beavers; we must now take notice how they proceed when they exercise their cruelty on that ferocious creature the bear.

To hunt the bear is a grand employment among the Indians, and one of their chiefs fixes the time for the sport. He invites all the hunters, and he does it with great ceremony and formality. As soon as the invitation is given, there follows a fast of ten days, during which the hunters must taste no more than what is absolutely necessary for the preservation of life. The reason they assign for this ridiculous fast is, that the spirits may be induced to discover the places where the bears have concealed themselves. Some of them, indeed, carry their superstition higher, for they cut their flesh in several parts, in order to make their god or devil more propitious. They never desire their demon or god to tell them how to overcome the bears, but only to be informed where they are concealed. There is something in this practice either manly or proud: manly, because they would embrace an opportunity of shewing their dexterity, by exerting their manual powers; and proud, because they tell the object of their worship, that they only want to encounter their enemy the bear, without depending on his assistance for strength to go through with the enterprize.

The fast being ended, and the place of hunting fixed, the chief, who is appointed to conduct it, gives a grand repast to all who are to be of the party, and none dares to presume to come to it till he has first bathed, that is to say, washed himself in the river, be the cold ever so severe, provided the ice can be broken. The feast is not like many others, where they are obliged to eat up every thing, for here they observe great sobriety, to strengthen them for the chase.

He who does the honours of the feast touches nothing,

thing; his whole employment, while the others are at table, is to relate his mighty feats in hunting on former occasions. The feast concludes with an invocation of the spirits of the departed bears. They then set out on their march, bedaubed with black, and equipped as if for war, amidst the acclamations of the whole village. This hunting is no less noble among these nations than war; and an alliance with a good hunter, is more coveted than with a famous warrior, as hunting furnishes the whole family with food and raiment, beyond which the Indians never extend their care; but no one is looked upon as a great hunter, unless he has killed twelve large beasts in one day.

These people have two advantages over us with respect to hunting; for, in the first place, nothing stops them, neither thickets, ditches, torrents, posts, nor rivers: they go always straight forward, in the directest line possible. In the second place, there are few, or perhaps no animals but what they will take by speed of foot. Some have been seen running in the villages, driving ten or a dozen of bears before them with a switch, like a flock of sheep, and the nimblest deer is not more swift than they. Besides, although the hunter reaps very little benefit from the chase, yet that is not all, for they are obliged to make large presents to the chiefs, who remain at home; and were he to refuse to do this, he would have his property torn from him by the rapacious hand of lawless power. It is however allowed him, in the distribution of what he has caught, to begin with his own family. Thus we found these people at first very simple in their manners, but after they became acquainted with the Europeans, they lost much of that simplicity, and became daily more cunning and knavish. Thus we find, that notwithstanding the vast benefits commerce is of to a nation, or to any people, when properly improved, yet when made a bad use of, it degenerates to mean selfishness, and creates a narrowness of spirit.

The season for hunting is in winter. These animals are then concealed in the hollow trunks of trees, in which, if they happen to fall, they make themselves a den with the roots, the entry of which they stop up with pine branches, by which means they are perfectly well sheltered from all the inclemency of the weather. If all this is still insufficient, they make a hole in the ground, taking great care to stop the mouth well when once they are entered. Some have been seen couched in their dens so as to be hardly perceivable, even when examined very nearly; but in whatever manner the bear is lodged, he never once quits his apartments during the winter; and strange as this may appear, it is past all manner of doubt. It is no less certain, that he lays up no manner of provision, and, consequently, he must of necessity live all that time without food or drink. Some have amused us with stories of his subsisting by licking his paws, but of this there is no certainty. Thus much is certain, that some have been kept chained up for a whole winter, without having any thing to eat or drink given them, and at the end of six months, they have been found as fat as at the beginning.

It is no doubt surprising enough, that an animal, provided with so warm a fur, and which is far from having a delicate appearance, should take more precaution against the cold than any others. This should serve to convince us, that we ought never to form our judgment of things by appearances, and that every one is the best judge of his own wants. There is therefore but little hunting necessary to catch the bear; the point is only to find his burrow, and the places where they haunt. When the huntsmen imagine they are near such a place, they turn themselves into a large circle, sometimes a mile in circumference, more or less, according to the number of sportsmen. They then move onwards, driving nearer and nearer, every one trying as he advances, to discover the retreat of some bear. By these means, if there are any at all in this space, they are certain of discovering them, for the Indians are expert ferrets. Next day they go to

work in the same manner, and so on every day while the hunting lasts.

As soon as a bear is killed, the huntsman places his lighted pipe, and blows the beast's throat and wind-pipe full of smoke, at the same time conjuring his spirit to hold no resentment for the insult done to his body, and to be propitious to him in his future hunting. But as the spirit makes no answer, the huntsman, to know whether his prayers are heard, cuts off the inner skin from under the animal, which he keeps till his return to the village, when all these skins are thrown into the fire, after many invocations and much ceremony. If these happen to crackle and shrivel up, which no doubt they will do, it is looked upon as an infallible sign that the souls of the bears are satisfied; if otherwise, they imagine the souls of the bears have a resentment against them, and that the next year something will be unpropitious to them, at least till some means are found to reconcile them, for they have a remedy for every thing.

The hunters make good cheer whilst the hunting lasts, and if it be ever so little successful, bring home enough to regale their friends, and to support their families a considerable time. To see the reception given them, the praises with which they are loaded, and their own air of self-satisfaction and applause, one would imagine them returning from some grand expedition, loaded with the spoils of a conquered army. Indeed they consider the killing of bears as the noblest action a man can do, which is not much to be wondered at, seeing they serve them for food and cloathing.

At their return home, the person who commanded the hunting orders the largest bear to be dressed, having first singed off the hair, as we do with hogs. They are obliged by their religion to eat up the whole remains; for whatever is left uneaten is considered as an affront to the spirit whom they worship. This feast is the most execrable that can be imagined, for they frequently eat till they are ready to burst, for which some of them often suffer much, being thrown into fevers and other disorders.

The bear is never dangerous in this country, but when he is hungry, or after being wounded. They, however, use abundance of precaution in approaching him. They seldom attack the men; they run away at the sight of one, and a dog will drive them a great way before him. If therefore they were every where as in Canada, one might easily say in words as a celebrated traveller, that the bear dreads the traveller, and not the traveller the bear. They rut in July, and then they become extremely tame; and at that time his flesh is so sickly and disagreeable, that even the Indians, who have not the most delicate stomachs, and who often eat such things as would make a European shudder, will hardly touch it. Who should imagine that an animal of this nature, and of so unlovely an appearance, should grow leaner in one month, than by fasting the whole winter? It is not surprising that in this season he should be so fierce, or in so ill an humour, that it would be dangerous to meet him. This is the effect of jealousy.

This season being over, he recovers his flesh, to which nothing contributes more than the fruit he eats in the woods, of which he is very greedy. He is particularly fond of grapes, and as all the forests are covered with vines, which rise to the top of the highest trees, he makes no difficulty of climbing up in quest of them; but should a hunter discover him, it would cost him his life. After having thus fed a good while on fruits, his flesh becomes extremely delicious, and continues so till the spring. However, it is always attended with one fault, namely, its being too oily, so that unless great moderation is used in eating, it certainly occasions a dysentery. It is moreover very nourishing, and a bear's cub is at least nothing inferior to lamb. If bear-hunting was properly attended to, the flesh of that animal might become a valuable article of commerce, and bring much money to those concerned in it.

March 11. We set out from the Three Rivers, and that

that day crossed the lake St. Peter, inclining to the south. We performed this journey on sledges, or, as they are here called, carriages, the ice being still strong enough for all sorts of carriages. In the afternoon we arrived at the convent of St. Francis, situated at the extremity of the lake of St. Peter, where there are a vast number of small islands, named after the great cardinal Richlieu.

The islands, rivers, and the whole of the country, bear the name of St. Francis, and each of the islands is about half a mile long, but their breadths are unequal. All were formerly full of deers, does, roebucks, and elks, for game increased in a surprising manner, and it is still far from being scarce, only that the large beasts have disappeared. There are also caught excellent fish in the river St. Francis, particularly towards its mouth. In winter they make holes in the ice, through which they let down nets five or six fathoms long, and these are never drawn up empty. The fishes most commonly taken here are of various sorts, but all useful, and many of them are sent to Europe, after having been salted. The lands of St. Francis, to judge of them by the trees they produce, seem to be extremely fertile and well cultivated. The planters, however, are very poor; and some of them would be reduced to a state of indigence, did not the trade they carry on with the Indians, their neighbours, help in some measure to support them.

The Indians we are now speaking of are called Abenaguies, amongst whom are some Algonquins, and a tribe called the Wolves, probably on account of the fierceness of their disposition. These people lived formerly in the province of New-York, but they were driven out by the English, and settled near a small river, which falls into St. Lawrence. They now live on the banks of the river St. Francis, about six miles from it, falling into the lake of St. Peter. This spot is very delightful, but the Indians have no relish for fine situations, and their huts serve to deform rather than embellish it. Here is a populous village, inhabited by Indians, who have been converted to the Christian religion, and these people are very docile and good natured.

Here we were regaled with the juice of the maple, this being the season for its flowering. It is extremely delicious, has a pleasant coolness, is exceedingly wholesome, and the manner of extracting it is very simple. When the sap begins to ascend, they pierce the trunk of the tree, and by means of a bit of wood, which is inserted in it, and along which it flows as through a pipe, into a vessel placed under it. In order to procure an abundant flow, there must be much snow on the ground, with frosty nights, and a serene sky. In proportion as the sap thickens the flow abates, and in the same proportion ceases soon after.

It is easy to guess, that after such a discharge of what may be called its blood, the tree should become weak, and yet many of them gather strength, and continue several years. They would do better to let them rest one year to gather fresh strength, in which case there would be much more liquor. But after it is wholly drained it is ordered to be cut down, and is extremely useful for many purposes.

The liquor of the maple is tolerably clear, though rather whitish; and let the quantity drank be ever so great, or the party ever so much heated, it is quite harmless. The reason is, it is entirely free from that crudity which occasions pleurifies, but has, on the contrary, a balsamic quality, which sweetens the blood, and a certain salt that preserves its warmth. It never crystalizes, but when it has been kept a considerable time, it becomes an excellent vinegar.

It is very probable that the Indians, who are well acquainted with the virtues of all their plants, have at all times, as well as at this day, made constant use of this liquor, but we are certain they were ignorant of making a sugar from it, which the Europeans have taught them. The method of making this sugar is to let the liquor boil till it takes a sufficient consistence, when it purifies of its own accord, without the mix-

ture of any other ingredient: but they must be very careful that the sugar be not over boiled, and to skim it well. The greatest fault in the process is, to let the sugar harden too much, which renders it too fat, so that it never loses the relish of honey, which makes it not so agreeable to the taste, at least till such time as it is clarified.

This sugar, when made with care, which it certainly requires, is extremely nourishing, and does not burn the stomach; besides, the manufacturing of it is done at a little expence. It has been commonly believed that it is impossible to refine it in the same manner as the sugar extracted from the canes; but there seems no reason for such a notion, and it is very certain, that when it comes out of the hands of the Indians, it is preserved much better than the canes in the West India islands.

The plane-tree, the cherry-tree, the ash and walnut-trees, of several kinds, also yield liquors from which sugars are made, but these are not so good as that of the maple-tree. Some, however, prefer that made of the ash, but it is rather scarce. One would hardly have thought to have found in Canada what Virgil mentions, when he is predicting the golden age, "*Ex aurea quercu sudabunt rosida mella*," i. e. that honey should distil from the oak.

This whole country has long been the scene of many a bloody battle, as during the war with the Iroquois it was much exposed to the incursions of those barbarians. They usually came down by way of a river that falls into the St. Lawrence, a little above St. Peter's, and on the same side with St. Francis. The islands of Richlieu being just in their way; they served them for a place of retreat, and to lay in ambush; but after this pass was shut against them by a fort built at the mouth of the river, they came down by land both above and below, and made their inroads on the side of St. Francis, where they found the same conveniences for pillaging, and where they committed cruelties too horrible to relate.

From thence they spread themselves all over the colony, so that in order to defend the inhabitants from their fury there was a necessity of building in every parish a kind of fort, where the planters and other settlers might take shelter on the first alarm. In these two centinels were kept night and day, and in every one of them some field pieces, as well to keep the enemy at a distance, as to advertise the inhabitants to be on their guard, or give the signal for succour. These forts were no more than so many redoubts; in each of them was the parish church, and huts erected for the women and children. These were sufficient to protect the people, for it does not appear that ever any of them were taken by the Indians.

They have even seldom taken the trouble to block them up, and were still more tardy to attack them with open force. The one is too dangerous an enterprize for Indians who have no defensive arms, and who are not fond of victories bought with much bloodshed. The other is altogether remote from their way of making war. But here a circumstance occurs that must not be omitted. In 1690, the savages, having learned that Madam de Vercheres was left almost alone in one of these forts, approached it, and put themselves in a posture of getting over the palisades. Some musket-shot, which were fired at them very seasonably, drove them to a distance, but they instantly returned. They were again repulsed; and what added to their astonishment, they could only discover a woman, whom they met wherever they went. This was Madam de Vercheres, who appeared as undismayed as if she had been in a numerous garrison. The hopes of the savages, in the beginning, of reducing with ease a place unprovided with men to defend it, made them return several times to the charge, but the lady constantly repulsed them. She continued to defend herself five days, with a valour and presence of mind which would have done honour to an old warrior; and she at length compelled the enemy to retire, for fear of having their retreat cut off, full of shame at having been repulsed.

repulsed by a woman. This was an instance of female valour, prompted by necessity, but seldom met with.

Two years afterwards there appeared another party of these savages, but more numerous than the former, and this was when the people were at work in the fields. The savages finding them situated in this manner, quite unguarded, seized them one after another, and then marched towards the fort. The daughter of the lord of the manor was about two hundred paces distant from it. At the first cry she heard she ran to get into the fort; the Indians followed her, and one of them came up with her just as she had got her foot upon the threshold; but having laid hold of her handkerchief she had about her neck, it gave way, and she got into the fort, shutting the gate behind her.

There was not a soul in the fort besides a young soldier, and some women, who at the sight of their husbands, whom they saw just bound and led away prisoners, raised most lamentable cries; but the young lady did not lose either courage or presence of mind. She began with taking off her head-dress, bound up her hair, put on a coat and hat, and locked up all the women, whose groans and weeping could not fail of giving fresh spirits to the enemy. After this she fixed a cannon, with several muskets, and shewing herself with her soldier, sometimes in one redoubt, and sometimes in another, and changing her dress from time to time, kept continually firing, till the governor, who was at some distance, came to her relief, released the prisoners, and drove the savages away. Here was another instance of female valour, which will ever do honour to the sex. It was not a mad or a rash attempt to throw away her life; it was a prudent step to rescue her countrymen, equal to the skill of the bravest general.

Presence of mind, and courage in distress,
Are more than armies to procure success.

We shall now take notice of the method used by them in hunting the elk.

This animal, in Canada, is of the size of an ordinary horse: it has a broad crupper, and the tail extremely short; the hough very high, with legs and feet like a stag; the neck, withers, and upper part of the thigh are covered with long hair; the head is about two feet long, which he stretches forward, and which gives the animal a very awkward appearance. His muzzle is thick, and bending on the upper part like that of a camel; and his nostrils are so wide, that one may with ease thrust his hand into them. Lastly, his antlers are full as long as those of a stag, and are much more spreading; they are branching and flat like those of a doe, and are new every year; but it does not appear that they have any mark to denote the age of the beast. The colour of the elk's hair is of a light grey mixed with a dark red, and it falls off as the creature advances in age. Its flesh is of an agreeable relish, light and nourishing; for the hunters, who live frequently on it, never perceived it to have any bad quality.

The Indians consider the elk as a beast of good omen, and believe that those who dream often of them may expect a long life; it is quite the contrary with the bear, for they never desire to dream of these creatures but when the hunting season is approaching. There is a very diverting tradition among the Indians, of a great elk of so monstrous a size, that the rest are like pigmies in comparison of them. His legs, say they, are so long, that eight feet deep in snow is nothing to him. His hide is proof against all manner of weapons, and he has a sort of arm, proceeding from his shoulders, which he uses in the same manner as we do ours. He is always attended by a vast number of elks, who form his court, and who render him all the services they can.

The elk is a lover of cold countries; he feeds on grass in summer, and in winter he gnaws the bark of trees: when the snow is very deep, those animals assemble in some pine wood, to shelter themselves from

the severity of the weather; where they remain whilst there is any thing to live on. This is the best season for hunting them, except it happens that the sun has strength enough to melt the snow; for the frost forming a kind of crust on the surface in the night, the elk, who is a heavy animal, breaks it with his forked hoof, and with great difficulty extricates himself. Except at this time, and, above all, when the snow is not deep, it is difficult to get near him, at least without danger, for when he is wounded, he is furious, and will return boldly on the huntsman, and tread him under his feet.

The huntsmen, in order to escape from him, throw him their coats, on which he discharges all his vengeance, whilst the huntsman concealing himself behind some tree, is taking proper measures to dispatch him. The elk goes always at a hand-trot, but such as equals the swiftest speed of the buffalo, and will hold out a great while. He falls down upon his knees to eat, drink, and sleep, and they have a notion that he has a bone in his heart, which being reduced to powder, and taken in broth, facilitates delivery, and gives ease to women in labour.

The most northern nations of Canada have a way of hunting this animal, very simple and free from danger. The hunters divide into two bands, one embarks in canoes, which keep at a proper distance from each other, forming a pretty large semicircle, the two ends of which reach the shore. The other body, which remain on shore, perform very nearly the same thing, and at first surround a pretty large tract of ground; then the huntsmen let loose their dogs, and raise all the elks within the bounds of this semicircle. These they drive into the lake or river, which they no sooner enter, than they are shot at by those in the canoes, and the shot seldom misses, so that few of them ever escape. There are several other ways of hunting him; but they differ very little from those just mentioned.

But the elk has other enemies besides the Indians, and that carry on full as cruel a war against him: the most terrible of all is the carcajou, a creature shaped like a cat, but with a tail of an enormous length, and a skin of a brownish red. As soon as this creature comes up to the elk, he leaps up and fastens on his neck, round which he twists his long tail, and then cuts his jugular: the elk has no means of shunning this ruin but by retiring to the water the moment he is seized by this dangerous enemy. The carcajou, who cannot endure the water, quits his hold immediately; but when the water is at a great distance, he destroys the elk before he reaches it. This creature, who does not possess the sense of smelling very acutely, takes three foxes along with him, whom he sends on the discovery: the moment they have got scent of an elk, two of them place themselves by his side, and the third make sport behind him; and all three manage matters so well, by harassing and plaguing the enemy, that they compel him to go to the place where they have left the carcajou, with whom they afterwards settle about dividing their prey.

Another wile of the carcajou, in order to seize his prey, is to climb up into a tree, where, couched along some projecting branch, he waits till an elk passes, and leaps upon him the moment he comes within his reach.

The stag in Canada is much the same with ours in Europe, though in general they are somewhat bigger. It does not appear that the Indians give them much disturbance; at least they do not make war upon them in form, as they do on the bear and the elk. It is quite different with the caribon, an animal somewhat like the rein deer, except in the colour of its hair, which is a dark brown. This creature is not so tall as the elk, and has much of the ass or mule in its shape, but is at least equal in swiftness to the deer. Some years ago one of them was seen on Cape Diamond, above Quebec, which was probably flying from one of his enemies; but immediately perceiving he was not in a place of safety, he leaped at one skip into the river:

river: he then swam across it with the same celerity, but was very little the better for having done so: some Canadians, who were going out on an expedition, watched his motions and shot him. The tongue of this animal is highly esteemed, and his true country seems to be somewhere near Hudson's Bay.

It appears that the carcajou has not multiplied much in the frequented parts of Canada, but we found elks in great numbers. The skins of these animals are become a considerable article of commerce; but it will still admit of many improvements. But this has not been attended to, for the inhabitants kill both old and young as they come in their way; so that their numbers have been much thinned. Indeed it is probable that, if this practice is continued, they will either extirpate the whole race of these animals, or drive them to such a distance as they will not be able to follow them.

In the southern and western parts of Canada, the hunting most in vogue is that of the buffalo, which is performed in the following manner:

The hunters draw up in four lines, forming a very large square, and begin with setting the grass on fire; that being very dry and rank at this season. They afterwards advance in proportion, as the fire gets round, closing their ranks as they go. The buffaloes, who are extremely timorous of fire, always run away, till at last they find themselves so hemmed in, and so close to one another, that a single beast seldom escapes. It frequently happens, that one company of these hunters will bring home fifteen hundred or two thousand buffaloes; but before they set out they agree on the places where they are to hunt; and this is done in order to avoid disputes. There are penalties inflicted on those who break through this regulation; as well as for those who quit their posts, so as to give the buffaloes an opportunity of escaping. The pains and penalties are, that the person offending must be stripped naked, his arms used in war taken from him, and his hut thrown down. The chief is subject to this law as well as the rest; and any one who would rebel against it, would be in danger of kindling a civil war, which would not be easily extinguished.

The buffaloes of Canada are larger than in other places; his horns are short, black, and low; there is a great rough beard under the muzzle, and a tuft of hair on the crown of his head, which falling over his eyes, gives him a most hideous aspect. The rest of the body is covered with a black fur, in great estimation; and the fleece of one of these creatures frequently weighs eight pounds. This animal has a long chest, the crupper pretty thin, the tail extremely short, and scarce any neck at all; but the head is large. He is very fearful, and runs away as soon as he hears any one approach him; and one dog will make a whole herd of them gallop. He has a very delicate and quick scent; and in order to approach him without being perceived, near enough to shoot him, the hunter must take care not to have the wind of him. When he is wounded, he groans grievously, and, if he is able, will turn upon the hunters. He is equally dangerous when the female buffalo has young ones, newly brought forth. The flesh is good, but only that of the female is eaten, the other being hard and tough. As to their hides, there are none better in the known world; for they are easily dressed, and although exceeding strong, are as soft as the finest shammy leather. The Indians make bucklers of them, but great numbers of the skins are sold to the Europeans.

The most common animal at present, in the frequented parts of Canada, is the roe-buck, which differs but little from ours. He is said to shed tears when he is attacked by the hunters. When young, his skin is striped with different colours, but afterwards the hair falls off, and other hair, like that of animals of the same nature in different parts of the world, grows up in its stead.

This creature is far from being fierce, he is easily

tamed, and seems to be a great lover of mankind. The tame female retires to the woods when she is in rut, and when she has had the male, returns to her master's house. When the time of bringing forth comes, she returns once more to the woods, where she remains some days with her young, and after that returns to shew herself to her master. She visits her young till they are able to follow her, and then she conducts them home.

In Canada are vast numbers of wolves, or rather creatures more like cats than wolves. These creatures are a sort of natural hunters, for they live upon what animals they can catch. Their flesh is white, and very good eating; their furs and skins are both well known in Europe, for this is one of the finest furs in any part of the province. They have likewise a sort of black foxes, which live in the northern mountains; and their skins are much esteemed. These, however, are seldom found, and they are inferior to those in Russia. Their hares and rabbits are the same as those in Europe, and so are many of their other animals.

March 23. We set out from St. Francis, and next day we arrived at Montreal. With respect to this city, it is well situated for commerce, but the prospect from it is far from being delightful. Nothing can be more dismal than the universal whiteness that takes place, when the snow covers the ground. Some of the ground near the town is well cultivated, and there are several plantations well laid out. The island of Montreal, which is in the centre of this country, is ten leagues in length, from east to west, and near the same in breadth. The mountain whence it receives its name, and which has two summits of unequal height, is situated almost in the middle, between its two extremities, and only at the distance of near half a mile from the shore; on which Montreal is built.

This city was first called Villa Maria by its founders; but it has never obtained the sanction of this name in conversation, and holds place only in public acts, and amongst the lords proprietors of it, who will not call it by any other. These lords are not only proprietors of the city, but also of the whole island; and they are in general very rich. This is the fruit of the industry of these lords proprietors of this island; and to this it is owing that the place is so flourishing.

The streets of Montreal are well laid out, and the houses are greatly enlarged of late years to what they were formerly. The beauty of the fields around it inspire a certain cheerfulness, of which every one is perfectly sensible. It is not fortified, there being only a single pallisadoe, with bastions, and in a very indifferent condition. It is not above forty years when there were no fortifications to this city, so that the improvements of late have been carried on with great rapidity. There was some years since a project for walling it round, but the inhabitants would not contribute towards it, so that it still lays in a defenceless state; but probably necessity will oblige them to carry on the works.

Montreal is of a quadrangular form, situated on the banks of the river, which rising gently, divides the city into the upper and lower towns; though we could perceive the ascent from the one to the other. The hospital, royal magazines, and places of arms, are in the lower town; which is also the quarter in which the merchants, for the most part, have their houses. The seminary and parish church, the convent of the Reallists, the jesuits, the daughters of the congregation, the governor, and most of the civil officers, live in the upper town. Beyond a small stream, coming from the north-west, and which terminates the city on this side, we came to a few houses, and the General Hospital; and turning to the right, beyond the Reallists, whose convent is at the extremity of the city; on the same side there is a kind of suburb beginning to be built, which will in time be a very fine quarter.

The convent belonging to the jesuits is extremely small, but their church is large and well built. The convent of the Reallists is more spacious, and their community more numerous. The seminary is in the centre of the town, and they seem to have thought more of rendering it solid and commodious than magnificent. It communicates with the parish church, which has more the air of a cathedral than that at Quebec. Divine worship is celebrated here with a modesty and dignity which inspires the spectators with an awful notion of that God who is worshipped in it.

The house of the daughters of the congregation, though one of the largest in the city, is still too small to lodge so numerous a community. This order was first established in Canada, and the nuns have done many good works since they were first settled. They visit the sick in the hospital, dress their wounds and sores, spending most of their time in performing acts of charity. They are poor, and yet there is no appearance of this in their hall or yards, which are spacious, and well furnished. Nor has their church any appearance of poverty; for it is handsome, and richly ornamented. Their house also is a much better structure than one could expect to meet with in this part of the world; but for all that, these good women are but ill fed, having a very scanty allowance, although they do much good in waiting on the sick, and instructing the ignorant in the principles of religion.

The General Hospital owes its foundation to a private person, called Charron, who associated with several pious persons, not only for this good work, but also to provide schoolmasters for the country parishes, who should perform the same function with respect to the boys, as the daughters of the congregation did with regard to the girls. But this worthy society was soon dissolved; some being called off by their private concerns, and others by their natural inconstancy, so that Charron was left alone to manage the work by himself. As sudden disappointments only serve to invigorate great minds, so this worthy person was not discouraged; he had begun a good work, and was resolved to leave nothing undone to see it accomplished.

The first thing he did was to subscribe a considerable sum of money himself, and, through his persuasions, many persons in power did the same. He built a house, assembled masters and nurses, and men took pleasure in aiding and empowering one who spared neither his money nor his labour, and whom no difficulties were capable of diverting from the good design. Lastly, before his death, which happened in 1719, he had the consolation to see his project beyond all fear of miscarrying, at least with respect to a subsistence. This house is a good plain building, and the church a very handsome one. The schoolmasters are still on no solid foundation in the parishes, and the prohibition made by the court of their wearing an uniform dress, and of taking single vows, may possibly occasion this project to miscarry.

Between the island of Montreal, and the continent on the north side, is another island, about twenty miles long, and six in breadth. This was at first called the Isle of Montmasny, after a governor general of that name; but being afterwards given to the jesuits, it is now called the Isle of Jesus, though it does not belong to that society, they having parted with it to the bishop and clergy of Quebec, who have begun to parcel it out into plantations, and settle inhabitants on it. These new settlers have been very industrious, and as the soil is good, there is no doubt but they will be amply repaid for their trouble. It was for the most part overgrown with wood, but that has been cut down, and sold at a considerable advantage; the profits arising from it having enabled them to go through with the work.

The channel which separates the two islands, bears the name of the River of the Meadows, as it runs between very fine ones. Its course is interrupted in

the middle by a very rapid current, called the fall of the Reallist, in memory of a monk of that order drowned in it. The religious of the seminary of Montreal had, for a great while, a mission in this island, but now they have sent them to another place.

The third arm of the river is intersected with so prodigious a multitude of islands, that there is almost as much land as water. This channel bears the name of the Thousand Islands, or, St. John's River. At the extremity of the Isle of Jesus, is the small island Bizard, so called from a Swiss officer, whose property it once was, and who died governor of Montreal. A little higher towards the south, is the island Perrot, so named from M. Perrot, who was the first governor of Montreal. This island is about six miles over every way; the soil is excellent, and they are beginning to clear it. The island Bizard terminates the lake of the two mountains, as the island Perrot separates it from that of St. Louis.

The lake of the two mountains is properly the opening of the great river, which falls into the river St. Laurence. It is six miles long, and as many broad; but that of St. Louis is somewhat larger. For a considerable number of years these places were the boundaries of the colony, but now it extends itself much further into the country. Every-where around the soil is the most excellent that can be imagined, and capable of very great improvements.

About three leagues above Montreal are two villages of Indians, who have been converted to the Christian religion; and these are reckoned of great service to the colony, because they are ready at all times to spread the alarm when any of their countrymen begin to advance. Here the missionaries have built churches, together with convents for themselves, in the most charming situations. The river, which is very broad in this place, is embellished with several islands, which have a very pleasing aspect. The island of Montreal is well stocked with inhabitants, who are very civil to strangers. The prospects from it are bounded on one side by delightful woods; but the sight has no bounds on the other, except lake St. Louis, which begins a little above this, and has at all times a noble appearance, even when it is frozen up.

Another village here, which is of great service to the colony, in giving the inhabitants of Montreal notice of the approach of the Indians, is called La Montaigne. It is situated on the head of the mountain, which gives name to the island. It is subject to the priests of Montreal, and inhabited by converted Indians. Many brave warriors have come from this town, but the avarice of the European merchants has introduced drunkenness among them, so that their conversion has rather injured than improved their morals.

The missionaries have in vain used every effort to put a stop to this disorder, but it still continues; and these Indians, when once intoxicated, although converted to the Christian religion, are then little better than the original savages. Even in the very streets of Montreal are seen the most shocking spectacles, the never-failing effects of the drunkenness of these barbarians. Husbands, wives, fathers, mothers, children, brothers, and sisters, seizing one another by the ears, and worrying one another with their teeth like so many wolves. The air, during the night, resounding with their cries and howlings, much more horrible than those of the wild beasts in the woods.

Those who, perhaps, have the greatest reason to reproach themselves, as being the promoters of these disorders, are the first who ask whether they are Christians. One might answer them, Yes, they are Christians, and new converts, who know not what they do; but those who in cold blood, and with the perfect knowledge of what they are about, reduce, from sordid motives of avarice, those sensible people to this condition, can they be imagined to have any religion at all? We certainly know, that an Indian will give all he is worth in the world for one glass of brandy, and this is a strong temptation to our dealers; against which, neither the remonstrances of their pastors, nor the zeal

and

and authority of the magistrate, nor respect for the laws, nor the severity of divine justice, the judgment of the Almighty, nay, nor the thoughts of a hell hereafter, which these barbarians much dread, have been able to prevail; but let us turn away our eyes from this subject, melancholy in speculation, horrid in practice, scandalous in being continued, and disgraceful to all those who, from the worst of motives, give it any manner of encouragement.

April 11. We went to visit fort Chambly, which is one of the greatest securities of the island of Montreal. This fort was built by M. Chambly, a French officer; but it has since been rebuilt of stone, and flanked with four bastions, having always in it a strong garrison. The lands round it are excellent; they begin to make plantations, and many are of opinion, that in time a city will be built here.

The distance from Chambly to lake Champlain is about twenty-four miles. The river Somel crosses this lake, and there is not, perhaps, a canton in all Canada which it would be more proper to people. The climate here is milder than in any part of the colony, and the inhabitants would have for their neighbours the Iroquois, who, although savages, yet are a friendly people when treated in a proper manner; nay, it is probable, they would never take up the hatchet, after they found that the European settlers were prepared to meet them in the field. But still good nature and humanity are the best means that can be used to mollify savages; for although they can be led, they will not be driven.

May 12. We came to the fall of St. Louis, and about a league from it is a pleasant village, which bears the same name. On our arrival here, we had laid our account of departing immediately after the festivals, but nothing can be more subject to disappointments than this method of travelling; we therefore continued some time uncertain when we should depart, but this, although a disappointment, gave us an opportunity of taking notice of every thing worthy to be seen in or near the place.

The first land of America, that is discovered in a voyage from Europe to Canada, is Newfoundland, one of the largest islands we are acquainted with: it has never yet been fully ascertained, whether the inhabitants are natives of the country; and its barrenness, were it really as great as it is supposed to be, would be no sufficient proof that they are not; for hunting and fishing afford sufficient support for Indians. What is certain is, that none but the Equimaux have ever been found upon it, and these are not originally of this island. Their real native country is the land of Labrador, and it is there they pass the greatest part of the year. Indeed, it would be profaning the name of a native country, to place in it none but wandering barbarians, who have no affection for any place, and scarce able to people two or three villages, yet occupy an immense extent of land. In such, besides the coasts of Newfoundland, where these Indians wander during the summer, there are none but that people to be seen throughout all that vast continent lying between Canada and the North Sea. Some of them have been found at the river Bourbon, which runs from the westward, and falls into Hudson's Bay.

The origin of their name is not certainly known, but it is probably derived from the word *esquimantris*, which signifies, among the Indians, an eater of raw flesh. Indeed these savages are the only people we know of, who eat raw flesh, though they sometimes broil it in the sun. It is also certain, that there is not another nation in America, that answers so nearly to the idea that Europeans form of savages. They are almost the only nation among whom the men have beards, which grow up to their eyes, and are so thick, that it is with difficulty their features can be distinguished.

They have likewise something very frightful in their air and mien, small fiery eyes, large and very ugly teeth, hair commonly black, sometimes fair, always very much in disorder, and their whole external ap-

pearance extremely brutish. Their characters and manners do not give the lie to the deformity of their physiognomy; for they are fierce, savage, suspicious, turbulent, and have a constant propensity to do mischief to strangers, who ought to be perpetually on their guard against them. As for the qualities of their minds with respect to knowledge, we can say but little, because few of the Europeans have opportunities of conversing with them.

They have been frequently known to go in the night and cut the cables of ships at anchor, in order to make them drive on shore, and then plunder the wrecks; nor are they afraid to attack them even in open day, when they discover their crews to be weak. It has never been possible to tame them, and it is not safe to hold any discourse with them, but at the end of a long pole. They not only refuse to come near the Europeans, but they will not so much as eat any thing they present to them; and in all things take so many precautions on their side, which mark an extreme distrust, that they must inspire those with the same sentiments who have any dealings with them. They are tall in stature, and tolerably well made. Their skins are as white as ours, which proceeds undoubtedly from their never going naked, even in the warmest weather.

Their beards, their fair hair, the whiteness of their skins, and the little resemblance and intercourse they have with their several neighbours, leave no room to doubt but they are of a different original from the rest of the Americans. As to the opinion that they are descended from the Basques, it seem to have but little foundation, for the languages of the people have no affinity with each other. It is much more probable that they are a colony from Greenland; for according to the situation of places on our terraqueous globe, the distance between the northern parts of America and Greenland cannot be great; nay, it will perhaps appear by future discoveries that they are united.

These savages are covered in such a manner, that only a part of their faces, and the ends of their hands, are to be seen. Over a sort of shirt, made of bladders, or the intestines of fishes, cut into fillets, and neatly enough sewed together, they throw a kind of surtout, made of bear-skin, or of the skin of some other wild beast; nay, sometimes of the skins of birds, whilst their heads are covered with a cowl of the same stuff, with the shirt fixed to it, on the top of which is a tuft of hair, which hangs down, and shades their foreheads. The shirt falls no lower than their loins; the surtout hangs down behind to their thighs, and terminates in a point somewhat lower than their girdles; but on the women it descends as far as the middle, where it is fixed by a girdle, at which hang little bones. The men wear breeches made of skins, with the hairy side inwards, and faced on the outside with furs. They likewise wear on their feet pumps made of skins, the hairy side of which is also inward; and above them furred boots of the same; and over these a second pair of pumps, with another pair of boots over that. And yet for all that, which would appear to us extremely cumbersome, yet these Indians are very active, and will travel a great many miles in a day.

Their arrows, the only weapons they use, are pointed with the teeth of the sea-cow, to which they likewise add iron when they can get it. In the summer they live in the open air, night and day; but in the winter under ground, in a sort of cavern, where they live together like so many beasts. Indeed they differ so much from each other in their different clans, or herds, that it is frequently difficult to form proper notions concerning their practices; but from what has been said we may learn with truth, that they are a ferocious people, and such as no attempts whatever have been able to civilize, so as to make them sensible of the benefits of society.

The holidays being over, we set out from the fall of St. Louis, and in the afternoon crossed the lake of that name. There we found some of our people, whom we had sent before, busily employed in securing
our

our canoe, which they had let fall from their shoulders while they were bringing it thither.

The place where we found our people employed is called the Cascades, being a rapid fall, at the upper end of the river that falls into St. Laurence, near the island of Perrot. To shun this dreadful fall of water we were obliged to keep considerably more to the right, and sometimes walk on shore, carrying our canoe along with us. This we did, in order to shun a second fall of the river; which had we approached, would have been attended with our destruction. These difficulties could be easily removed, at a small expence, were there inhabitants enough in the country acquainted with commerce; but hitherto few settlements have been made in it.

A little above this the river stretches itself out above nine miles in breadth, and the lands on each side are fertile, but still in a great many places covered with wood. They have begun to clear those laying on the northern banks, and it would be very easy to make a highway from the point opposite to the island of Montreal, as far up as the mountains. By this means one might shun a passage of forty leagues, and a navigation rendered almost impassable by continual falls of water from the stupendous precipices. And here it would be necessary to have a fort erected, which would overawe the Indians, and prevent them from making incursions into the province. Besides, a vessel might sail from hence to Niagara in two days with a favourable wind. It is true they would have a little farther to travel, but they would then shun a passage of eight or ten leagues across Lake Ontario. Galatte is the proper place for erecting a fort of this nature; and it is near the first fall of the river we have mentioned. It is impossible to express the advantages that would arise from a scheme of this nature being reduced to practice; for this country cannot be attacked on the side next the river St. Laurence, by reason of the dreadful falls of water, and nothing is more easy than to repulse an enemy in any attempts of that nature. These things, however, have been still neglected, but it is hoped, that common prudence will induce those who may happen to be in possession of this province to take such precautions as are consistent with sound policy.

May 3. We advanced about three leagues, and came to a place called the Cedars. This is near the third fall of the river, and is called the Cedars on account of a vast number of those trees growing near it; but of late many of them have been cut down. Here we saw nothing worthy of our notice, so that next day we proceeded to the fourth fall of the river, which is about six miles higher, and here one of our canoes split in pieces. These accidents are very frequent, which is not much to be wondered at, when we consider the rapidity of the stream, against which there is no making opposition.

On the fifth we crossed the lake St. Francis, which is about twenty miles long, and three in breadth. The lands on both sides of it are good, but not properly cultivated. As soon as we had crossed the lake, we encamped a little to the south of it, and in the night we were awakened by the most doleful cries, as if the people had been murdering each other. We were much frightened at first, but in the end were given to understand, that the noise was made by a sort of corniorants; and this noise was always a sign of wind, and it actually happened so the next day.

On the sixth we passed what they call the Channels, formed by a multitude of islands, which occupy almost all the river in this place. Here the country on each side is charming; and the prospects from the mountains, covered with woods, delightful. The rest of the day we spent in getting over the rapid falls of the river, which at first presented us with a most horrible prospect, nor was it an easy matter for us to extricate ourselves out of our difficulties. We made, however, this day, upwards of twenty miles, and encamped in the evening at another fall of the river, where we slept quietly during the night.

On the seventh, in the morning, we passed this fall of the river, and continued under sail till three in the afternoon, when the river became so violent, that we were obliged to encamp again till the next day. On the eighth there fell some snow, which still detained us, and towards evening it froze extremely hard.

On the ninth, we passed the last of these falls, and here we were filled with admiration in beholding the beauty of the country. The lands, although not cultivated, had a most cheerful appearance; the earth was covered with verdure; there were some straggling cottages to be seen in different parts; the woods pointed out to us that they were either inhabited by wild beasts, or by savages in human shape; and we saw as many stately oaks growing as would, if properly used, fit out a royal navy of fifty ships of the line.

On the tenth, we came to an island, called Tonihata, about a mile long; and the soil extremely fertile. An Indian whom the French, for what reason is not known, called a Quaker, obtained a grant of it. On the twelfth we went to visit him, and found him at work in his garden; a thing not very common among the Indians; but this person affected to follow the fashions of the Europeans. He received us with the utmost civility, and desired us to stay all night with him, but the fine weather induced us to pursue our journey; so that we took leave of him, and spent the night about six miles further, in a most delightful place. We had still, near forty miles to sail before we could reach Cataroconi, and, as the weather was fine, we embarked at three in the morning. We passed through an archipelago, called The Thousand Islands, and, so far as we could observe, there were not less than five hundred of them. Here the river is upwards of a mile over, and on one of them is a fort.

This fort has four bastions, built of stone, which occupy above half a mile in circumference. Its situation is really delightful; for the banks of the river, on each side, present a variety of beautiful prospects. This is the scene at the entrance into the Lake Ontario, at no more than two miles distance. It is adorned with a vast number of islands, of different extent, all of them well wooded, and without any thing to confine the prospect on that side. This lake bore, for some time, the name of St. Lewis, but it has now recovered its antient appellation. Opposite the fort is a very pleasant island, in the middle of the river, and hogs were formerly kept in it, which multiplied greatly, and from them it still retains its name. There are two other small islands below this, but none of them contain any thing worth mentioning. There was formerly a very large commerce carried on at this place, especially with the Iroquois; the design was, to prevent them from carrying their furs to the English. But this commerce did not last long, for the fort was neglected, and consequently the savages plundered this part of the colony. There are still a few European families here, who reside in small huts, but they are in continual fear of the Indians, so that their condition must be extremely disagreeable. Were forts erected to check the insolence of the barbarians, and proper governors appointed in them, new discoveries might be made; but the princes in Europe are more intent upon their pleasures at home, than in making improvements among those natives whom they have subdued.

May 16. We set out early in the morning, and now it was for the first time that I had seen vines growing in Canada. We were told that these vines continue growing all the way till you come to Mexico, which is not at all improbable, because the climate became gradually warmer the farther south we proceeded in this journey. These vines are very thick at the bottom, and bear great plenty of grapes, which, however, are not much larger than pease; but this cannot be otherwise, seeing they are neither pruned nor cultivated. When ripe, they afford excellent feeding for the bears, who climb to the tops of the highest trees in quest of them. After all, the bears have only what

what the birds have left, who generally destroy them before they come to a state of perfection.

Next day we set out early in the morning, and about noon stopped at a small island, where we had an opportunity of viewing the country, because we were to stay here till the following day. Here the prospects were in a manner so unbounded, that they are beyond description. Mountains covered with trees, dreadful precipices, falls of water discharging themselves into the lake, beautiful and diversified spots of ground; pleasant meadows, that would have nourished thousands of cattle; Indians walking at a distance, and the whole crowned with the beautiful horizon, so that we thought ourselves in a terrestrial paradise.

About four in the afternoon we set sail in our canoes, but had not proceeded far when the wind became very tempestuous, so that it was with great difficulty we could get to land. As soon as we got out here, we pitched our tents, and slept quietly till morning; when the wind still continuing, we resolved to rest all day at this place, and take a view of the country. Here we were presented with noble prospects indeed: the tall oaks seemed to raise their heads to the clouds, the fields were covered with the most beautiful verdure, and here we found a tree much resembling the evergreen ash, but it is called by the natives the cotton-tree, because it bears a shell nearly of the same size as a common walnut, bearing a sort of cotton, which, however, is good for nothing. All along the banks of the lake the wind is serene and calm, but there is a sort of flux and reflux almost instantaneous, which, however, is never attended with any dangerous consequences.

About ten at night, as we were going to retire to rest, we heard a most dreadful cry, which we did not understand, but were told it was the war-cry, and soon afterwards a troop of Indians entered the fort where we lodged, singing all the way as they came along. These Indians had been for many years at war with the colony, and therefore it was their common practice to come every summer to take what booty they could find. When they go to war, they call it taking up the hatchet, by which they mean to declare war. Every private person may do so, but it is more commonly done by the consent of the community at large. The first part of the ceremony in declaring war, by these savages, is to hang a kettle over the fire, which undoubtedly has its origin from their barbarous custom of eating their prisoners, or such as have been killed, after boiling them. They say, simply, that they are going to eat such a nation, by which is meant they are going to conquer them, and they may eat them if they please. When they want to engage an ally, they send him a large shell, which is a token that he is to drink the blood of their enemies out of it, or, which is much the same, broth made of their flesh. It is certain this practice is of great antiquity, as will appear to any one who reads the historical books of the Old Testament: but then it must be considered, that ancient practices, let them be ever so much sanctified by bigots, and countenanced by hypocrites, yet they never can set aside moral obligations. We might enlarge further on this subject, but it is not worth going on with. The hypocrite, who talks of religion while he is sober, is worse than the profligate who laughs at it while he is drunk.

A war, in which a whole nation is engaged, is not easily put an end to. They weigh all the circumstances with deliberation; and whilst they are consulting, they take great care to remove every thing that may give the enemy the least suspicion of their intention of breaking with them. The war being once resolved upon, they set about providing every thing necessary for carrying it on, which does not require much time. He who is to command does not so much as think of raising soldiers till he has fasted several days, during which he is bedaubed all over with black, and holds no manner of discourse with any one, taking care to invoke his titular deity, to whom he pays a devotion as if he was the Supreme Being.

Their firm persuasion, according to the presumptuous genius of these barbarians, induces them to believe, that they are marching out to fight in the cause of truth, and therefore they promise themselves certain victory. The fast being ended, he addresses himself to his countrymen in words to the following purport.

“My brethren, the great spirit is the author of what I speak, and has inspired me with the thoughts of what I am going to put in execution. The blood of our brother, who was killed, is not yet wiped away; his corpse is not yet covered, and I am going to perform this duty to him. I am therefore resolved to march to the place, to take scalps, or to make prisoners, for I will eat that nation: should I perish in this glorious enterprize, or should any of my companions in it lose his life, this collar I hold in my hand shall be as a recompence to him who buries the dead.”

As he pronounces these last words, he lays the collar on the ground, and he who takes it up is declared the second in command in the army. He then thanks him for his zeal to revenge his brother, and to maintain the honour of his nation. Then they set water on to warm, wash the chief from his daubings, and again anoint him with oil and fat, or paint his hair: they paint his face with different colours, and cloath him in his finest robe. Thus adorned, he sings, with a hollow voice, the song of death: all those who have offered their services to attend him thunder out, one after another, the war song; for every one has a song for himself, which no other person is allowed to use.

These war songs being concluded, the chief communicates to the meeting the methods he has proposed for carrying on the war, and then retires, leaving them to deliberate concerning them. As soon as his project is approved of, he makes a feast, at which the chief, and sometimes the only dish, is a dog. They dedicate this beast to the god of war before he is put into the kettle, and he is eaten up with all manner of greediness; it being conceived by these savages, that he who eats the largest share will be the most courageous.

These ceremonies take up several days, or rather the same are repeated for several days successively. But though every one seems wholly employed in this festival, each family takes its measures for obtaining a share of the prisoners, either to replace their losses, or to revenge their dead. With this view they make presents to the chief, who, on his part, gives his solemn promise that all their requests shall be complied with. In default of prisoners, they demand scalps, which are more easily obtained, and these satisfy the desires of the savage barbarians.

There is no such thing as forcing men into these expeditions, for none but volunteers are accepted of; and those who enlist themselves must give to the chief, as a token of their engagement, a bit of wood with their mark upon it; and if the person who does so should afterwards, in a cowardly manner, leave the army, he would be either put to death, or treated with contempt ever afterwards. The forces being gathered together, and all prepared to begin the expedition, the chief entertains them a second time with the flesh of dogs boiled, and then makes a speech to the following purport.

“My brethren, I know I am not worthy to be called a man, though you all know that I have more than once looked an enemy in the face. We have been slaughtered; the bones of our brethren lie yet unburied, they cry out against us, and we must satisfy their requests; they were once men as well as we; why then should we so soon forget them, and sit so long in this lethargy on our mattresses: in a word, the spirit who is the guardian of my honour, and the author of my renown, inspired me with the resolution to revenge them. Youth, take courage, anoint your hair, paint your faces, fill your quivers, cause the forests to resound with your military songs, let us ease and comfort the deceased, and tell them that we have avenged their injuries.”

Having delivered this speech, the chief marches into
10 B the

the middle of the company with his hatchet, and the whole join together in singing the war song; the soldiers take up their hatchets and bows, and they all swear to second him, or die in the attempt. All this is accompanied with gestures that shew they are resolved never to give way to the enemy; but not a word escapes from the mouths of any of the soldiers, that indicates their dependence on the chief. The whole consists in a promise to act with unanimity and in concert.

Their songs are followed with dances, and sometimes this is no more than a barbarous irregular sort of mirth. The chief is no more than a spectator with a pipe in his mouth; but this leads us to treat of a very remarkable custom among them, which they have observed from time immemorial. It is as follows:

The most antient of the military company treat such of the young people, who have never seen an enemy before, with all the marks of disrespect: they throw hot water on their heads; they reproach them as cowards, and carry their abuse to the utmost pitch. All this must be endured with a seeming insensibility; for to complain, in the least instance, would be sufficient to exclude them for ever from bearing arms. It is certain this is done in order to rouse the courage of their youth, for no young man loves to be called a coward.

As the hope of having their wounds cured, if they should receive any, is no small encouragement for the bravest to expose themselves boldly to danger, they afterwards prepare the drugs for this purpose; and this is the office of their jugglers. The whole town or village being assembled, the juggler declares that he is going to communicate a virtue to the drugs that will cure all their diseases, and frequently he falls a singing. The other jugglers, or quacks, join with him in concert; and while they are singing, the people believe that the medicinal virtues enter into the plants. The chief juggler then makes trial of them, by cutting his own lips, and then applying them to cure the wound. As the juggler has the art of stopping the blood, which is not very difficult, the people cry out, "A miracle! a miracle!" After this, he takes a dead dog, or some other dead animal, and blowing wind through a pipe into its lungs, makes it move; and this is considered by the ignorant as a second miracle. Lastly, the whole company of the jugglers make the tour of the village, singing the praises and virtues of their pretended remedies.

From the time of their forming their intention of going to war, till they take up the hatchet, they spend the days in making the necessary preparations, and the evenings in singing their war songs. If the rout is to be by water, they repair their canoes; and if it is in winter, they prepare themselves sledges and shoes proper for carrying them over the snow. Their shoes are made very artfully of strong coarse leather, with the fur outward, for these savages seldom feel cold.

Their sledges, which serve to transport their baggage, or such of their companions as are sick or happen to be wounded, are made of two small thin pieces of wood, about three feet broad, and seven in length. The fore part is somewhat round, and the sides bordered with small bands, to which the thongs for binding whatever is laid upon them are fastened. Let one of these carriages be ever so much loaded, an Indian draws it without any difficulty, by means of a long strap, which passes round his breast in form of a collar. They use them likewise for carrying burdens, and most of them for carrying their children, with their cradles; but in this case the collar is fixed round their foreheads, instead of their breasts.

Every thing being ready, and the day for their departure fixed, they take their leave of their friends with serious tokens of real affection. Every one is desirous of having something of the warriors to wear about them, and in return they give them something as pledges of their friendship, assuring them that they will ever honour their memories. They then wait upon the chief, whom they find ready armed to receive

them. From that moment the procession begins in the most profound silence, the women marching before, carrying their provisions; and when the warriors have joined them, they strip themselves almost naked, that their march may not be impeded. In this manner they continue till they come up with the enemy, and then a most bloody battle ensues. Those whom they kill are always scalped; but if they can take prisoners, it is reckoned more honourable.

Having traversed a large part of this country, we came within sight of the fall of Niagara, one of the greatest curiosities in the world, and perhaps a thousand times superior to the celebrated cataracts of the Nile, in Upper Egypt. In our way across the mountains we were entertained by an Indian chief in the following manner. It was towards the evening when we entered his cabin, where we found a fire lighted, and near it was a man sitting, beating a drum, and another was singing in concert. This lasted two hours, and tired us very much, as they were always repeating the same thing over again. We intreated our host to order them to cease, who with a good deal of difficulty complied with our request. Then five or six women made their appearance, drawn up in a line in very close order, their arms hanging down, and dancing and singing at the same time. When they had continued this exercise about a quarter of an hour, the fire, which was all that gave light in the cabin, was put out, and then nothing was to be perceived but an Indian dancing with a lighted coal in his mouth. The concert still continued, and the women repeated their dances and singing from time to time. The Indian danced all the while; but as he could only be distinguished by the light of the coal in his mouth, he appeared like a goblin, and was horrible to behold. This medley of dancing and singing, with the horrid appearances of the parties concerned in it, was frightful enough; and, to our no small mortification, it continued till morning.

We inquired how a man could hold a lighted coal in his mouth so long; but all we could learn was, that these Indians have a certain herb, known only to themselves, with the juice of which they rub their mouths, and this prevents the fire from having any effect on them. It is certain, however, that one piece of coal could not have kept burning so long; but then we may naturally suppose, that these jugglers, like all other impostors, have the art of substituting one in the room of another, without being seen by the spectators, a practice in all nations where there are impostors; and what nation is without such a pest of society!

Next day we crossed several dreadful mountains, in order to take water a little above the fall of Niagara. Our journey was not above ten miles, but we had many difficulties to struggle with; and the place where we were to embark was six miles above the fall. As we approached this famous cataract, we found that the baron La Hontan had given such an erroneous description of it, that we were convinced he had never seen it; so that there is no wonder his account of North America should be read with contempt by every one who seeks after the truth. As we could only approach it on one side, so it was a difficult matter to measure its proper height with such instruments as we had along with us. De Lisle, in his maps, has made it six hundred feet high; but this we could not believe, for we made use of a pole tied to a long line, and after many repeated trials, we found it only one hundred and twenty feet high; but then it must be considered, we were not certain but the pole might have been stopped by the way against the projecting of some rock. However, after the nicest inquiry we may venture to assert, that it is not less than one hundred and forty feet high.

As to its shape, it resembles a horse-shoe, and is about four hundred paces in circumference, divided into two, exactly in the middle, by a very narrow island, about half a mile in circumference. These two parts very soon unite, and there are several branches that project from the body of the cascade, but which, when

When viewed in the front, appeared to us as perfectly entire. Here, upon enquiry and observation, we found that the baron La Hontan had never seen the place; or if he had, he has invented an account of it altogether inconsistent with the truth.

A great way below this fall, the river contains such striking marks of so violent a shock, that it is full ten miles before it becomes navigable. It is the same above the fall, for the vast tide of water driving towards a precipice, over which it is to discharge itself into the bed below the current, is so strong, that the greatest vessel would be carried down by it. It was formerly reported, that no birds could fly over it; but we found quite the contrary, for we saw all sorts of them flying from one side of the shore to the other. This we find, that travellers will entertain people with falsehoods; but here we have related no more than what we saw.

This amazing sheet of water falls upon a rock, and the violence of the concussion has made a deep bed for it. This is not at all to be wondered at, for there are in many parts of Europe small cascades, where the falls of the water have had the same effect on the solid rock.

In short, this is one of the most surprizing wonders that man ever beheld. To see a vast stream of water falling forwards to the top of a precipice, carrying every thing before it, and then discharging itself into an empty space below, must fill the mind with astonishment and admiration. The fall of the water is heard at a considerable distance, but not so far as some travellers have represented it. It is very difficult to take a proper view of it, because it must be done sideways, or in profile. Above we can see the water gathering with a majestic fury to the top of the precipice, and viewing it below the fall, a mist obscures it from our eyes. The Indians never come in their canoes within six miles of the fall above, otherwise they would be drawn over the precipice by the rapidity of the current; and experience teaches them, that it would be impossible for them to go on board below the fall, till the violence of the concussion had subsided.

The soil a little above the fall is rather barren, has little wood upon it, and it is infested with vast numbers of rattle-snakes, especially during the heat of the day. The Indians esteem the flesh of those animals a great dainty, and in general serpents are no ways frightful to them. They have the figures of them painted on their faces, and they never seek after them but for food. The bones and skins of serpents are also of great service to their jugglers and wizards in divining, the skins of which they make use of for belts and fillets. It is no less true, that they have the art of stupefying these reptiles, for they will take them alive, and put them into their bosoms, without receiving any hurt; a circumstance that contributes greatly towards the preserving of their credit among their deluded followers. But we must now return to say something more concerning the methods used by the hunters in carrying on their wars against their enemies.

The moment all the warriors are embarked, the canoes sail to a small distance, keeping close together in one line; then the chief rises, and sings his own war song, with which his soldiers join in concert. The elders, who are at that time on the banks, exhort the warriors to do their duty, and, above all, to be aware of being surprized. This is of all the advices that can be given an Indian, the most necessary; and yet they frequently profit little by it. The chief keeps singing all the while, and the warriors conjure their relations to remember them, if they should be killed; and then raising the most horrid shouts, they set sail, and are out of sight in a few minutes. They do not sail far, for their lakes and rivers will not permit them to do so; but as soon as they come to a landing place, they encamp in the following manner:

They pitch their camp long before sun-set, and

commonly place in the front of it a large space, inclosed with a pallisadoc, or rather a kind of lattice work, on which are fixed their banners, pointing to the place where they intend to march. They invoke their idols to be propitious to them; and this they continue to do on the morning of every day before they begin their march. This being done, they imagine they have nothing to fear, being persuaded that the divine spirit takes upon himself all the rest; and the whole army sleeps securely on the strength of this persuasion. No experience is able to undeceive these barbarians, or to draw them out of their presumptuous confidence. This has its source in laziness and indolence, which nothing is able to overcome.

Every thing in the way of these Indian warriors is considered as an enemy; but when they meet with those who are going on the same expedition with themselves, they enter into a mutual state of friendship. When they are on the point of entering the enemy's country, they halt to perform a very extraordinary ceremony. In the evening there is a great feast, after which they go to sleep. In the morning, as soon as all are awake, those who have had any dreams go from tent to tent, or rather from fire to fire, singing their death song, in which they insert their dreams in an enigmatical manner. Every one sets his brains to work to interpret them, and if no one should be able to succeed in it, the dreamers are free to return home. A fine opportunity for cowards indeed!

After this, new invocations are made to the spirit, to enable them to acquit themselves nobly, and to perform wonders; they swear to aid each other mutually. Lastly, they begin their march; and in case they have come too far in their canoes, they take care to conceal them. While they act with prudence, it is difficult to surprize them, even in an enemy's country; they are all enjoined silence, so that every one is prohibited from speaking; but this rule is seldom attended to in a proper manner. The Indians are naturally presumptuous, and the least capable of being brought under proper discipline of any people in the world. They neglect not, however, to send out scouts every evening, who employ two or three hours on different sides. If they discover any of the enemy, they kill them, and carry back their scalps to the camp; but if otherwise, they rest quietly till morning.

As soon as they have discovered an enemy, they send out scouts to bring them an account of his strength, and upon their return a council of war is held. The attack is generally made at day-break, and with great fury. This is the time they think the enemy is in the deepest sleep, and they keep themselves laid flat on their faces during the whole of the night without stirring, for, perhaps, no people in the world are more cunning; they make their approaches in the same manner, creeping upon their hands and feet, till they have got within a bow-shot of the enemy, then they all start up, and the chief gives the signal by a small cry, to which the whole body makes answer by hideous howlings, and at the same time make their discharge of arrows. Then, without giving the enemy time to recover themselves from their consternation, they pour upon them with hatchets in their hands, in the most merciless manner.

But when they find their enemies on their guard, or too strongly intrenched, they retire, provided they have still time to do it; if not, they boldly resolve on fighting to the last moment, and it sometimes happens that there is abundance of blood shed on these occasions. A camp that has been forced, is the very picture of fury itself, the barbarous fierceness of the conqueror, the despair of the poor helpless conquered, who know what they have to expect, should they fall into the hands of their enemies, occasions prodigious efforts on both sides, which even surpass both imagination and description. The figure of the combatants, all besmeared with black and red, still augments the horror of the conflict, and a very good picture of hell might

might be drawn from this model. When the victory is no longer doubtful, the conqueror first dispatches all those whom they despair of being able to carry with them, and then they order the remainder to be driven home as prisoners.

There is something barbarous in this practice, and yet it is what we meet with among all the inhabitants of uncivilized nations. It is true, these Indians are naturally intrepid, and all sorts of dangers seem but trifles to them. That pride, which stimulates men on to great actions, operates strongly on their minds, and they are willing to lay down their lives, in order to be accounted heroes after their deaths, rather than in the most pusillanimous manner to flee from the face of the most formidable enemy.

War among these savages is almost always made by surprise, which generally succeeds well enough; for when it happens that any of the Indians commit blunders, they are naturally expert enough in making some sort of amends, for not having been properly on their guard. They are in general so well acquainted with the country, that they can tell, by looking at the grass, whether an enemy has been upon it; and this is of considerable service to them, for it not only guards them against surprises, but at the same time it points out to them the time when their enemy was upon the ground, and the place where they are encamped. No mercy is shewn to an enemy, for the prisoners are all massacred without distinction; and nothing is more common than for them to feed on the flesh of those whom they have made captives, or at least to sell them as slaves.

May 27. We set out from the fort of Niagara, in order to proceed to the lake Eric, and we accomplished our journey without much trouble. The leisure time we had, while we were upon the lake, gave us an opportunity of committing to writing many particulars concerning those Indians whom we have already mentioned.

All the prisoners taken in the war, are consigned over to the mercy of those who walk before the warriors; and if any one has lost a son or a husband, or any other person who was dear to her, were it even thirty years before, she becomes, as it were, a perfect fury, she fixes upon the first that falls into her clutches, and it can hardly be conceived to what a height her rage will transport her. She has no regard either to humanity or decency, and at every blow she gives, you would think the prisoner would fall down dead at her feet; but these barbarians have the art of protracting the torments of those unhappy creatures who have the misfortune to fall into their hands. The whole night is spent in this manner at the encampment of the warriors.

Next day is appointed as a day of general triumph for the warriors, and the Indians affect a great deal of moderation on these occasions. The chiefs enter the villages first by themselves, without any display of ostentation, observing a profound silence, and retire to their cabins, without shewing any signs of revenge against their captives. This is the case with the Iroquois, but it is all formality and hypocrisy. In some of the other nations, they pull off the mask of deceit, and treat their prisoners in the following manner:

The chief marches at the head of his company with the air of a conqueror; his lieutenant or deputy comes after him, and is preceded by a trumpeter, who rehearses the death song to the prisoner; the warriors following two and two, having the prisoners in the middle, crowned with flowers, and their faces painted. Their bodies are naked, and they hold a stick in one hand, and a hatchet in the other. Every captive sings his death song, and there is something in it horrible beyond expression. He shews not the least appearance of fear; but as if he was just going to partake of a banquet, he raises his voice, and utters aloud, "I am brave and undaunted, and fear neither death nor the cruellest torments: those who fear them are cowards, and less than women. Life is nothing to a man who has courage; may rage and despair choak all my ene-

mies; why cannot I devour them, and drink up the last drop of their blood?"

The prisoners are made to halt from time to time; the Indians in the mean while flocking round them, dancing themselves, and causing them to dance, which they seem to do very cheerfully, relating all the time the bravest actions of their lives, and mentioning the names of all those whom they have killed or burnt. They take particular notice of those in whom the assistants are mostly interested; and it may be said, that their chief design is to incense those who are to decide their fate. The truth is, these wretches never shew any mercy to captives, and therefore they know they have no reason to expect any when they are taken prisoners themselves. It is remarkable of these Indians, that their pride is such, that they even brave the severest torments; nay, they pretend their tormentors are doing them a pleasure.

Sometimes these prisoners are obliged to run between two rows of Indians, armed with stones and cudgels, who strike them at every blow, as if they intended to kill them. This, however, never happens; for these savages, in order to keep the wretch in torment as long as possible, never strike on any of those parts where the blow would occasion death. In this manner they are led from one cabin to another, and every one may give him as many blows as they think proper. One plucks off a nail, a second cuts off a finger, either with their teeth, or a bad knife, which cuts like a saw. An old man turns off their flesh to the bones, a child pierces them with an awl wherever she can, a woman beats them till she is fatigued; and all this time the warriors never lay hands on them, although they have them in their power.

These preliminaries being over, they set about dividing the captives; and as soon as the council have determined their fate, a crier calls the people together, where a distribution is made without any sort of noise whatever. Those women who have lost their husbands or sons in the wars, are always first gratified. Afterwards they fulfil the engagements they entered into with those from whom they have received collars of wampum; and if there is not a sufficient number of prisoners for this purpose, the defect is supplied with scalps, which are worn by way of ornament on days of rejoicing; but at other times are hung up at the gates of their cabins. If, on the other hand, the number of prisoners is more than sufficient for these purposes, the overplus is sent to their allies.

The place of a chief is always filled up by him who is not in authority; and when the chief has been killed, seven slaves at least are burnt alive, to make an atonement for him. No prisoner can be put to death without the consent of the women; and the reason is, some of the women having lost their husbands, are glad to embrace one of the prisoners.

The warriors, in some nations, never divest themselves of the right of disposing of their prisoners, and those whom the council has distributed to them, are obliged to make restitution to them if demanded, which, however, seldom happens; but when it does, they are obliged to restore the pledges they have received for those who had contracted for those prisoners. If, upon their arrival, the warriors declare their intention upon this point, they are seldom opposed. In general, the greatest number of the prisoners are condemned to suffer death or slavery, in which their lives are never secure. Some are adopted; and from that time, their condition differs in nothing from that of the children of the nation. They assume all the rights of those whose places they occupy, and frequently enter into the spirit of the nation of which they are become members, so that they go to war with them as if they were their countrymen. By this policy, the Iroquois have hitherto supported themselves; for having been constantly at war, from time immemorial, with all the nations round them, they must have been by this time reduced to nothing, had they not taken care to naturalize a large number of their prisoners of war.

As soon as a prisoner is adopted, he is carried to the cabin, where he is to remain, and he is declared free. He is washed with warm water; and his wounds, if he has any, are dressed. Nothing is omitted to make him forget all the evils he has suffered; victuals are set before him, and he has cloaths brought him to put on. Some days after this a feast is made, in the course of which he receives, in a solemn manner, the name of him whom he replaces; and from thenceforth not only succeeds to all his rights, but likewise becomes liable to all his obligations.

It frequently happens that those who are condemned to be burnt, are treated in the same indulgent manner as those who are adopted, till they are brought to the place of execution; for these savages put their prisoners to death, not so much by way of punishment, as to have a holiday. It is probable these are fattened for sacrifice, and many of them are offered unto the god of war: the only difference between them and other captives is, their faces are rubbed over with grease and black. Excepting in this, they treat them in the best manner possible, setting before them the most choice food, never speaking to them but with an air of friendship, calling them son, brother, nephew, according as they themselves are related to the persons whom the prisoners are to be sacrificed for. Sometimes they yield the girls up to their pleasures, who serve them as wives during the time they have to live. They are not made acquainted with the time they are to suffer, till the moment they are led out to execution.

As soon as every thing is ready for the execution, they are delivered up to a woman, who, from the fondness of a mother, passes at once to the rage of a fury; and from the tenderest caresses to the most extreme madness. She begins by invoking the spirit of him she is about to revenge. "Approach (says she) you are going to be appeased; I am preparing for thee afresh; drink deep draughts of this broth, which is now to be poured out before thee; receive the victim prepared for thee, in the person of this warrior: he shall be burnt, and put into the cauldron; burning hatchets shall be applied to his skin; his scalp shall be flayed off; they will drink out of his skull; leave therefore thy complaining; thou shalt be fully satisfied."

This, properly speaking, is the Indian form of pronouncing sentence of death; and although it frequently varies in the words, yet it is always the same in substance. A crier then calls the prisoner out of his cabin, proclaiming aloud the intentions of the person to whom he belongs, and concludes by exhorting the prisoner to perform his part well. A second herald then advances, and addressing himself to the prisoner, tells him, "Thou art going to be burnt, my brother, be of good courage." The prisoner answers, "It is well, I thank thee:" and then he is led to the place of execution. He is chained to a post, but in such a manner as to be able to turn round it. Before they begin to burn him, he sings the death song; in which he makes a recital of all the heroic actions he ever performed, and always in a stile and manner insulting to his enemies. He then exhorts them to be as cruel to him as possible, because he is a warrior, and can bear any thing. The truth is, he knows he will receive no mercy, and therefore his enthusiasm elevates his mind so as to forget pain.

Having advanced nineteen leagues farther, we came to a great river, on the banks of which were vast numbers of trees, but the leaves had not then begun to bud. We staid here all night, and in the morning embarked on the river, which we crossed with some difficulty. The first of June, being the day of Pentecost, we entered the mouth of another most beautiful river, and sailed up it above an hour: we passed a carrying-place, of about six paces in breadth. The following day we saw nothing remarkable, but coasted along a charming country, hid, at times, by disagreeable prospects; which, however, are of no great extent. Wherever we went ashore, we were quite enchanted by the beauty and vivacity of the landscapes; which were terminated by one of the noblest and most beau-

tiful forests in the world. Add to this, that every part of it swarms with water-fowl; but we had no opportunity of inquiring whether the woods abounded with game; only that we saw a prodigious number of buffaloes.

Were we always to sail as we then did, with a serene sky, in a charming climate, and on water as clear as the purest fountain; were we sure of finding every where security, agreeable places to spend the night in, where we might enjoy the pleasures of hunting at a small expence, breathe at our ease the purest air, and enjoy the prospects of the finest countries in the universe; we might possibly be tempted to travel to the end of our days. It frequently brought to our minds the conditions of those antient patriarchs, who had no fixed place of abode, who lived in tents, who were, in a manner, the masters of all the countries they passed through; and who enjoyed, in peace and tranquillity, all their productions, without the plagues attending the possession of a landed estate.

On the fourth, we stopped at a place called Bald Point; because, on one side, there is not much wood. Near this place are vast quantities of cedar trees, but we were told that they were not good for much. There are vast numbers of bears, and four hundred of these animals were killed the winter before we arrived there.

On the fifth, towards four o'clock in the afternoon, we perceived two small islands on the south shore, and we were told that these islands are so infested with rattle-snakes, that it is dangerous coming near them. A little farther we came to the island of St. Claire, where there is a place called the Narrows, the water being much confined by its banks, so that the current is strong; and if it should happen that the river is swelled, then it would be fatal to any person attempting to sail upon it.

This is reckoned the finest place in all the province of Canada; and nature seems to have refused nothing to it that could make it beautiful. Hills, fields, woods, forests, rivulets, fountains, lakes, and rivers, all so blended together, as to equal the most romantic works a towering genius can form. The vast number of small islands in the lakes seem placed there as so many ornaments to the scenes; and, in a word, the whole may be considered as a terrestrial paradise.

Three miles above the island of St. Claire is a small fort, and near it are two popular villages, both inhabited by the Indians.

June 7. Which was the day after our arrival at this fort, the governor general sent a gentelman to call some of the Indians together, to propose that they should not admit any more brandy to be imported amongst them. He might, with parity of reason, have told them that they must never more see the sun; for those people were not to be brought off from the use of those liquors, that seemed so well calculated to stimulate them on to madness.

There was something both decent and simple in the appearance of the Indian chiefs. They approached in ceremonial order, with pipes in their mouths; and one, more eloquent than the rest, was appointed to act as public orator. His figure, and the tone of his voice, were both calculated to command respect; and when we heard the interpreter explain the oration to us, we were convinced that it must have been much more beautiful in the original. It was partly in praise of the valour of his countrymen; and he concluded, by declaring that they would use their liberty, and the French might do the same; they would lay no restrictions upon their countrymen. They were dismissed with some presents; and the trade for these liquors will, probably, continue as long as Europe carries on a trade with the Canadians.

Next day we went to visit their villages, and returning through one belonging to the Huron Indians, we met a great number of them overheated with a play which they call the game of the platter.

The game of the platter, or bones, is played between two persons only; each person has six or eight little bones, which at first we took to be the stones of apricots,

apricots, being of the same size and shape; but upon viewing them more particularly, we discovered our mistake. They had six unequal stones, the two largest of which were painted, the one black and the other of a straw colour. These they fling up into the air, striking at the same time upon the ground with a large hollow dish.

This dish is made to spin round, and the ball is received into it; when they have no dish, they content themselves with throwing the bones up into the air with their hands. If all of them present the same colour, when they fall, the winner has five points, and the number of the game is forty. The points won are discounted, till they come up to the whole number, and then the game is settled. He who wins the first game, continues to play, but the loser gives up his place to another, who is named by the opposite party; for both in their towns and in their villages, they never go to play without dividing themselves into equal numbers.

At each throw that is played, especially if it be a decisive one, they make the most horrid shoutings, and the players themselves are more like devils than men. They have a right to change their partners as often as they chuse; and this suits their tempers, for they are so fickle, that they seldom continue long in one mind. Their physicians, who are also their priests, frequently attend these games; and it happened one day, in a Huron village, that a sick woman having caused one of their priests to be called for, the impostor prescribed for her the game of the platter, and ordered that she should play at a village distant from her own. She immediately sent to the chief of the village to obtain his permission, which was readily granted; and the woman having played the game, told the rest of the Indians present, that she was cured of her maladies. So far, however, from being cured, she was much worse than ever; the fatigue of the game threw her into a fever, and she died a few days afterwards.

The vengeance of the woman's relations fell heavy upon the poor missionaries, merely because they happened to be present at the game; and the Indian priests told them, that ever since they had come into the country, their gods had not been able to work miracles. It is difficult to say whether the Indian priests, or the jesuit missionaries, were the greatest villains. The Indians contented themselves in answering all the arguments of the jesuits in the following laconic words, "You have your gods, and we have ours; only it is our misfortune, that ours are the least powerful of the two."

In this part of the country are vast numbers of physical herbs; and here a botanist might exercise his knowledge, during a long life. There are also vast numbers of citron-trees, which grow in the open fields, and the fruit is much the same as in Portugal, but they are smaller, and of a disagreeable flavour. It is remarkable, that the root of this tree is a subtle and mortal poison; and, however surprising it may appear, it is at the same time an antidote against the bite of a serpent. It must be bruised, and applied instantly to the wound; and this remedy seldom fails of success, especially when they take care to apply it before the parts are swelled.

The manners and customs of these Indians differ much in their different colonies, and will undoubtedly continue to do so, while every district is governed by its own chief. Were hundreds of these districts united under one regal form of government, the manners of the people would approach to a state of civilization; the subjects would begin to relish the sweets of society; they would live in friendship with each other; justice would be properly administered, and crimes would not escape condign punishment. On the contrary, their aristocratical form of government disappoints all these valuable purposes, and contributes towards keeping the people in a state of barbarity.

They have strange notions concerning the right of

property in goods, which are in all respects consistent with a state of nature. They believe that whoever finds any thing, is entitled to the possession of it; but when the things are stolen, the thief is punished. This will appear from what we are now going to relate.

A good old woman had for her whole worldly estate but one collar of wampum, worth about ten crowns of French money, and which she carried about with her in a little bag. One day, while she was at work in the fields, she chanced to hang her bag on a tree; another woman, who happened to see it, had a good mind to appropriate it to her own use, and thought no opportunity could ever be more favourable; she therefore kept her eye constantly upon it, and in the space of two hours, the old woman being gone into another field, the other went up to the tree, seized the bag, and affected to cry for joy that she had found it. The old woman immediately heard, and said the bag belonged to her, and that it was she who had hung it upon the tree; that she had neither lost nor forgot it, and that she intended to take it down as soon as her work should be over. The other woman answered, that she had found it; and that she would keep it.

After much contest between the two women, the affair was brought before the chief of the village, who declared, that according to the rigor of the law, the woman who found the bag was intitled to it; but the circumstances were such, that it should be restored to the woman who had lost it, on condition of her making a present to her who had found, or rather stolen it. Both parties agreed in the judgment, so that there was an end of the controversy. As in all nations where the people live in a state of nature, laws are weak, and but little regarded by barbarians, so among these Indians it is found more necessary to punish crimes with disgrace than with death. This has the desired effect, for savages seldom mind the most excruciating tortures, so as they can satiate their brutal revenge upon those whom they imagine have given them any offence.

June 30. We set out from the Narrows, but had only proceeded a few miles on our journey, when we were overtaken with such a dreadful storm, that we were obliged to encamp in a wood, where we spent the night in a very disagreeable manner. The next day we traversed the lake of St. Claire, which is about twelve miles in length, and the country on both sides was extremely agreeable. At about half way, on the left-hand side of the lake, we were presented with a view of the Huron River, which is one hundred and twenty feet in breadth at its mouth. On the right side, almost opposite, is another river, the mouth of which is twice as wide, and it is navigable above two hundred miles up the country, without any rapid current, a circumstance that seldom takes place in this part of the world.

The course from the fort at the Narrows to the end of this traverse is east north-east, and its compass four leagues till you come to the south. At the end of this we came to an Indian cottage, situated in a delightful plain, near to which were three most beautiful meadows, and in the grandest situation that could be imagined. This is a noble channel, as straight as a line, and bordered by beautiful forests, interspersed with lakes, in all of whom are pretty islands, scattered so up and down, that they heighten the beauty of the prospect.

In crossing the lake we had a young Indian along us, who was extremely dextrous in managing our canoe. This young man dressed himself before he came on board, and every now and then he looked in his glass to see that nothing about him was discomposed, or whether the sweat had not washed off the paint with which he had daubed his face. A most dreadful storm came on, and we were obliged to take shelter in a small island. Our young Indian did not seem much mortified at our being stopped, for these people pay little regard to any sort of disappointments.

Perhaps

Perhaps he had no other intention in dressing himself, than the vanity of being admired by us; but if this was his design, then his labour was but poorly bestowed, for we had seen him first in his original likeness. He appeared much more agreeable to us in his native colour, than from the paintings with which he had daubed his skin. However, these young fellows are very fond of these daubings, which they call paintings; for nothing can more effectually recommend them to the females. Some of them will spend half a day in painting themselves in this manner, only that they may have the pleasure of strolling from door to door, in order to be admired; and then they return home to their cabins, very well satisfied, being convinced that some of the young women have fallen in love with them, which may serve to shew that human nature is the same in all countries.

We entered lake Huron about ten in the forenoon, where we diverted ourselves in fishing for sturgeon. Next day we failed a great way up the lake, but were obliged to lay all night at anchor.

Next morning, being the second, a deep fog prevented us from making much way; for it was extremely dangerous, on account of the vast number of rocks that are to be met with every where in the lake. These rocks project a vast way into the lake; and as we could only see a few yards before us, so we were in continual danger.

Next day the fog cleared away, and we were presented with a view of the country, which was far from being so agreeable as some of those we had already passed.

This lake is no less than six hundred miles in length from east to west; and in some places above two hundred miles in breadth. In sailing along it, the greatest danger arises from a north wind, and therefore it is best to keep to the north shore, that being wholly lined with rocks, which form little harbours, where shelter may be obtained with the greatest ease, and nothing is more necessary to be attended to by those who sail in canoes.

The Indians pretended to foretel any storm that happens, at least two days before. At first they perceive a gentle wavering on the surface of the water, which lasts the whole day without intermission; and the day after the lake is covered with large waves, but without breaking all that day, so that the canoes are in no sort of danger. The next day the storm begins to pour down without intermission, and the flames of lightning are incessant. In such cases it is dangerous to be on the south side of the lake, because of the violence of the wind from the north.

The Indians have such a respect for this lake, that they offer sacrifices to it, or rather to the spirit that presides over it. This is owing to the vast quantities of fish it produces, and likewise to its own majestic appearance. If we may credit these people, this lake has its original from something of a divine nature. This is in all respects consistent with the notions of the antient heathens, and indeed with those who at present reside on the coast of Corromandel, in the East Indies. Large pieces of copper ore are constantly found near the banks of this lake; and those insignificant things are looked upon as objects of veneration. They say that there was formerly a large rock of this metal here, but it was swallowed up by an earthquake, but now there is no appearance of it. However, we had no great reason to believe that the whole story is true.

Among all the Indian nations there are some families who can only be permitted to contract alliances with each other; and this seems to point out that pride which is so peculiar to mankind in general, but more in particular to savages, whose minds have never been enlightened with the knowledge of the truth. Marriage, however, is not considered in this country in such a serious light as in Europe. Divorces are frequent, and men may put away their wives as often as they think proper, although it is expected that they should shew some reasonable cause to the chief of the

village where they reside. In some places a husband has a right to cut off the nose of his wife when she elopes from him; and in our journey we met with many of these creatures mangled in this manner. In some places they may part by mutual consent, and this is generally done without any sort of noise. These Indians cannot conceive how we should make any difficulty about it; and one of them once spoke to a priest in the following words, which may serve to shew what are their notions of civil obligation:

“My wife and I (said he) cannot agree to live together in peace, and my neighbour is in the same condition, so that we have agreed to change wives; we therefore act as pleases ourselves, and so who can say any thing against it?”

Jealousy prevails strongly among these savages, and both sexes are infected with it. When a woman has discovered that her husband loves another better than herself, her rival must be upon her guard, otherwise the consequences may prove fatal. This, however, does not frequently happen, for the women here are as amorous as in any part of the world. They are continually entering into intrigues; there is no bounds fixed for modesty; moral obligations are trampled on; but yet the man who treats his wife in an improper manner, without taking her first before the judge of the village, is punished in a summary way.

The parents are the only match-makers in this country, for the parties never converse together about the matter, giving themselves wholly up to the will of those who, according to custom, have the right of disposing of them. They pay much regard to the modesty of the young women while the match is making; and yet in some places they live a year together before they have fixed whether they shall be married to those young women who are proposed to them as wives.

The Indian women are generally delivered without much pain, and frequently without any assistance; but as human nature is in general the same in all nations, so many of the women have the same excruciating pains here as in other parts of the world.

Nothing can exceed the care mothers take of their children, while in their cradles; but from the moment they are weaned, they abandon them entirely to themselves. And what is very remarkable, they pretend that this is not done from principles of hard-heartedness, or want of tenderness to their offspring, for they pretend to love them to the end of their lives.

When they intend to give up their children to an abandoned state, they impose a name upon them; and this is generally done at a festival, at which are present none but persons of the same sex and age with the child that is to be named. During the repast, the child remains on the knees of its parents, who are incessantly recommending it to the divine spirit; and particularly to that angel who is to be his guardian; for they all believe, with the heathens of old, that every person has a guardian angel to attend him through the whole of his progress in this world.

In their addresses to each other, although barbarians, yet they observe a great number of ceremonies; but these are of such a trifling nature, that they do not deserve our notice.

Leaving this part of the country, we took an opportunity of travelling along with Mr. De Montigny, a knight of the order of St. Louis, and captain of a company of soldiers in Canada.

July 2. We embarked on the lake, and coasted above eighty miles along a neck of land, which separates lake Meihigan from lake Superior. A little further, inclining to the south-west, we came to a large gulph, in the entry of which was a great number of small islands; and this is called the bay of Noquets. It is separated from the great bay by an island inhabited by Indians, who have a small village on it. Here we rested one night, and were treated with as much civility as if we had been in Europe.

July 6. We were stopped almost the whole day by contrary winds; but it growing calm in the evening, we embarked a little after sun-set, by the favour of a most beautiful moon-light; and continued our voyage for four and twenty hours together. The sun was so burning hot, and the water of the bay so warm, that the gum of our canoe melted in several places. To complete our misfortune, the place where we went on shore was so infested with gnats, that we could not so much as close our eyes, though we had not slept for two days: and as the weather was fine, and the sun shone bright, we set out again at three o'clock in the morning.

After we had advanced five or six leagues, we found ourselves abreast of a little island, which lies near the western side of the bay, and which concealed from our view the mouth of a river, on which there is a village inhabited by Indians. This is the only village in the country; nor are there any towns, and the manure is the finest in all Canada. They have a language peculiar to themselves, and, what is remarkable, the rest of the Indians do not understand them.

A little below the island, the face of the country is much changed; for, from being wild and rugged, it becomes extremely delightful, presenting some of the finest scenes in the universe. There is a fort erected in the bay, in which a company of men do duty, but it is not a place of importance. The only service it is of, is to induce the Indians to build their cabins near it; for these people, though in many respects savages, yet love to be near the Europeans.

The day after our arrival here, the chiefs of some of their nations paid us a visit, and one of them shewed us a Catalonian pistol, a pair of Spanish shoes, and a sort of drug used as an ointment. That they should have had any connection with the Spaniards, was to us very surprising; but the mystery was cleared up by one of their chiefs.

He told us, that about two years before, some Spaniards, who said they came from New Mexico, to take a view of the country, and drive out the French, failed down the river, and destroyed two villages. As the Indians had no fire arms, and being likewise terrified at seeing such a number of strangers among them, the Spaniards put them to death without mercy. Two villages being thus destroyed, the Spaniards thought they were sure of making a conquest of the country; but the Indians in the next village they intended to attack lay in ambush for them. The Spaniards were so certain of success, that they all got drunk, and laying down to sleep, the Indians came upon them, and cut almost all their throats. There were two priests among the Spaniards, one of whom was killed, and the other taken prisoner, but he made his escape in the following manner:

He happened to have a fine horse, and the Indians being fond of seeing feats of horsemanship performed, he took the advantage of their curiosity, in order to make his escape. One day as he was sauntering about in their presence, he withdrew, as it were, insensibly, at a distance, when clapping spurs to his horse, he instantly disappeared. As they had no other prisoner than him, so it is not known exactly from what part of New Mexico he came, nor with what design, any further than what arose from conjectures.

They brought us all that belonged to the priest whom they had killed, among which was a breviary, together with the things already mentioned. Here we found the Indians to be extremely ignorant, and vastly different in their manners from those who keep any sort of connection with the Europeans.

The day following, some of the Indian chiefs came to invite us to be present at one of their councils, with which we complied, and took our seats among them. When every one had taken his place, the chief laid a collar upon the ground before us, and then the orator besought us, in the name of the whole congregation, or rather assembly, to take them under the protection of our king, and to purify the air, which, they said, had been corrupted for some time; and this appeared to be

true, for at that time there were many of the people of the village sick.

We told them that our king was very powerful, and much more so than they imagined, but that his power did not extend over the elements; and that when diseases, or any other accidents laid waste the territories, he addressed himself to the great God, who created the heavens and the earth, and who alone is the sovereign Lord of nature. We added, that they should do the same, and that they might then look up for success; but in order to obtain the favour of the great God, they were first to acknowledge his power, and their dependence on him.

As for any protection which our king could grant, we told them, that it was at their service, because our king sought nothing with greater eagerness than that of taking part with the afflicted. This answer seemed to satisfy them, and they promised to be directed by us, but we had little hopes of seeing our labours crowned with success.

On the afternoon of the following day we were entertained by the chiefs with a dance opposite the governor's house. It was different from any thing we had ever seen before, and from this circumstance we learned, that the Indians do not all use the same practice concerning their entertainments.

This we found to be properly a military festival, in which the warriors were the sole actors, and we were led to conclude, that it had been invented merely to give them an opportunity of repeating their warlike deeds. All those whom we saw dancing, were young persons, and probably the entertainment was kept up amongst them, in order to inspire them with martial courage. The dancers were placed quite round the spectators, in small bodies, and the women apart from the men. They all sat down on the ground when the dance was over, dressed in their best robes, which, at a distance, made a very pretty appearance. The whole of the entertainment was conducted with the greatest decorum; and if it was not very elegant, yet there was nothing in it offensive.

A post was erected between the place where the dancers was and the governor's house, and at the end of every dance one of the Indian warriors came up with his hatchet, and gave it a knock. On this blow being given, profound silence ensued, and then the warrior repeated his warlike exploits. The whole entertainment lasted about four hours, and we were heartily tired of it.

In the western parts of the province they have another kind of entertainment, which they call the buffalo dance. The dancers form several circles within each other, and the music is played off in the middle of the place. They take care never to separate those of the same family; they do not hold one another by the hand, and each carries his own armour and buckler. The circles here are round different ways; and though there is much nonsensical congeing, in which they spring to a great height, yet they are never out of time.

At certain intervals, some chief of a family presents his buckler, and all the rest strike upon it, repeating at the same time his famous exploits. He afterwards cuts a bit of tobacco from a post to which it had been tied, and gives it to one of his friends. This dance is followed by a feast, in which many of the Indians get so drunk, that they are more like beasts than men. It is remarkable of the people of this country, what a vast veneration they have for bears, and this probably is owing to the nourishment they receive, in consequence of eating the flesh of those animals. The head of the bear, after having been painted and decorated with all sorts of flowers, is set, during the repast, in a most conspicuous place, where it receives the homage of all the guests, who celebrate in praises the virtues of the dead animal, whilst they are hewing his body in pieces, and regaling themselves with it. These Indians have not only, like all the rest of the savages, a custom of preparing themselves for great huntings by fasting, which they sometimes observe for ten days together,

gether, but they also oblige their children to fast; and they conclude, from their dreams, whether they will have good or bad success. The intention of those fasts is, to appease the spirit who presides over the creatures whom they are to go in pursuit of; and the notion itself is ridiculous enough.

July 29. We set out in a canoe from this place, and in the evening arrived at a small nameless island, where we rested two days, as the weather was very stormy; we then advanced above twelve miles, in order to come to the place called Michegap, from a lake of the same name: and then turned towards the south, which was the only course we had to steer for three hundred miles, as far as the river St. Joseph. Nothing can be finer than the country which separates the lake Michegap from lake Huron; we continued advancing forward, till a brisk wind arose, which obliged us to take shelter in a small island, where the people treated us kindly.

We remained here eight days, and then set out for the river St. Joseph, where we resided several days. Here is a fort, and the governor has a house, but both are poor mean structures. All the use they are of is, to keep the Indians in a sort of awful respect, and, if possible, to bring them into a state of civilization. There are two villages here inhabited by Christians, but most of these were converts to the Christian religion; but they had been so long without a pastor, when we arrived there, that they had almost returned back to a state of paganism.

The next thing that claims our attention, is the river St. Joseph, which comes from the south-east, and discharges itself into the lake Michegap, the eastern shore of which is three hundred miles in length; and we were obliged to sail so far before we came to the mouth of this river. From the mouth of the river, we sailed sixty miles before we came to a small fort, and the navigation was extremely dangerous, because, when the wind blows from the west, the waves extend across the whole of this lake.

The next place we visited was the Beaver Islands, so called, from the vast number of those creatures that are there. We went ashore on one of these islands, and found it very sandy and barren; but the country, on the other side of the river, is extremely beautiful. It is also well watered. We were now and then presented with the prospects of most beautiful rivers, and pieces of water falling from the rocks. The beauty of these natural cascades was heightened by the trees that surrounded them, for all the banks of the river are sheltered with wood.

Most of these rivers are but narrow, and have no great depth of water; and there is one single circumstance attends all of them, which is, that as soon as we entered them, we found several small lakes, all well stored with fish, and, considering every thing, no part of the world can appear more agreeable.

The next place we entered, was the river of Father Marquette, which, at our first entrance, we found to be no more than a brook; but a little higher, we entered a lake, which we found to be no less than six miles broad. We were much surprised how such a piece of water could discharge itself into the lake; but upon examination, we found that it was no ways improbable.

This day we continued advancing in our canoe, but did not get above ten miles, for we were obliged to pitch our tents at the mouth of the river Stadechaz, on the banks of a fine lake, longer, but not quite so broad as the former. Here we found great numbers of red and white pines, which, in the warm season, emit considerable quantities of gum, and these the Indians sell to the Europeans.

After supper, and prayers being over, we went to take a walk in the cool of the evening, along the banks of the river. We had a spaniel along with us, who followed us wherever we went; and this creature happening to plunge into the river, in quest of something he imagined he saw there, our people thought it was a roe-buck, but the night was too dark for

them to see him. Accordingly they set out with their loaded pieces; and one of them seeing me (says Charlevoix) thought I was a bear, standing upon the hind paws; therefore he charged his musket with three balls, and, continuing close to the ground, approached me as near as possible. He was just going to fire, when I also began to distinguish something, but could not tell what it was; I believed it to be one of the people in our company, and asked him, whether he took me for a bear? He made no answer, and when I came up with him, he was in a manner speechless, and like a person seized with horror, at the thoughts of what he had nearly committed. Thus I had a narrow escape, but I impute the whole to divine Providence.

The river St. Joseph is so commodious for the commerce of all parts of Canada, that it is no wonder the Indians have constantly frequented it. Besides all this, it waters an extreme fertile country; but this is not what the natives esteem it most for. Indeed they have so little knowledge of agriculture, that good lands are as it were thrown away upon them. Some years ago, several tribes of Indians settled on the banks of this river, but they have now returned to their former habitation.

Sailing up the river St. Joseph, we took notice of some trees we had never seen before. The most singular of these was a sort of an ash, of a most beautiful colour, with very broad leaves; and when the leaves are boiled, they become so hard that they are of no manner of use. The fields round the fort are covered with sassafras to such a degree, that the air is perfumed with them. This tree is not so large as in Carolina, for it is only like a small shrub, creeping on the ground; but, possibly, these are only some small branches, springing up where trees formerly grew.

The Indians in these parts are naturally thieves, and make prize of whatever they can catch. It is true, that when a person has lost any thing, he may recover it; but that cannot be done, without giving something to the chief of the village. Indeed these are such savages, that rather than give up any thing they have stolen, without a suitable reward, they will go to war with those who demand it from them. This may serve to shew how weak human laws are, where they live in a state of nature; for where human society is properly formed, there is an awe and terror on the minds of men, which prevents them from committing the most enormous crimes.

Some few days after this we went to visit the chief Indian of the place, in consequence of an invitation he had sent us for that purpose. He was extremely tall, and well made, but he had lost his nose in one of their Indian battles. It was well he had not lost his skull, for they generally scalp, or put to death, all the prisoners whom they can lay hold of.

As soon as he was informed that we were coming to visit him, he went and placed himself in the inner part of his cabin, in a sort of alcove, where we found him seated cross-legged, in the same manner the people do in Turkey. He said something to us, and seemed to affect a sort of gravity, which he supported very ill. This was the first Indian chief we had seen behave in this manner; but we were told that we must treat him again in our turn.

This day we were entertained with what the Indians call the game of straws. These straws are small rushes, of the thickness of a stalk of wheat, and two fingers in length. They take up a parcel of these in their hands, which generally consist of two hundred and one; but whatever the number is, it must be unequal. After they have well sorted them, and made a thousand distortions of their bodies, they invoke the spirit whom they worship, and then divide them with a sharp stone into several pieces, or parcels, making nine or eleven of each. Each takes what he can lay hold of at a venture, and he to whom the first parcel of eleven falls, gains a certain number of points, according to the terms of agreement.

But there are other ways of playing this game, though none of them deserves a particular notice. They told us, that there was as much art as chance in this game, and that their countrymen were as great cheats as the gamblers in more polite nations. They have another game, which although not for money, yet proves destructive of their morals.

At night several posts are erected in a round form, in the middle of some cabin, and in the midst of all are the instruments upon which they play. Here are several other posts fixed up, and the young people promiscuously dance round them. From time to time a young man goes out from the rest, and takes from one of the posts some down fixed to it, and this he chuses as most agreeable to his mistress. He places it upon her head, dances round her, and gives her a sign of assignation where he is to meet her. The dance being ended, the feast begins, and lasts during the whole day, without the least interruption, and in the evening the whole company retire; but the girls are sure to meet with their lovers at some private place, notwithstanding all the vigilance of their parents.

These Indians are great slaves to the belief of dreams, and whatever wild notion strikes them in their sleep, they pretend to explain it, as implying something in the ordinary course of human affairs. One day it happened that two missionaries were travelling in the company of some Indians; and one night as the Indians were in a profound sleep, some of them awaked suddenly as if out of breath, making efforts to cry out, and beating himself as if he had been possessed with the devil. The noise he made soon awaked every one near him, and they at first thought he was mad. They seized him, and tried to bring him to himself, but all to no purpose. His fury continued to increase, and as they were no longer able to hold him, they concealed all their warlike instruments, lest he should have done them some mischief. Some of them proposed giving him the juice of particular herbs to drink; but while they were making the necessary preparations, he jumped into the river.

He was immediately drawn out, and although he confessed that he was cold, yet he refused to go near the fire, that had been just lighted to warm him. He sat down at the foot of a tree, and as he appeared more composed, they brought the draught they had prepared for him. "It is to this child you must give it," (said he, pointing to a bear's skin stuffed) and his request was complied with, in order to humour him. They then asked him what had been the matter with him? I dreamed, said he, that a racoon had got into my belly. They all burst out a laughing; but there was a necessity of curing his distempered imagination, which was done in the following manner.

They all began to counterfeit the madman, crying with all their might, that they had animals in their bellies, but added, that they were unwilling to throw themselves into the river, in order to dislodge them, on account of the cold, and that they thought sweating a much better way. The madman approved of the proposal, and a stove was immediately erected, into which they all entered with loud cries, every one endeavouring to counterfeit the cry of the animal whom he pretended to have in his belly; one a goose, another a duck, a third a bustard, and a fourth a frog; the dreamer also counterfeited the cry of a racoon. But the most ridiculous thing was, they all kept beating on their drums to time; and this was done in order to make the savage fall asleep. He slept a considerable time, and when he awoke, found himself perfectly recovered, being in all respects insensible of what had happened to him, which must have exhausted his spirits had he not been an Indian.

The affair, however, of dreaming becomes sometimes more serious; for should any one take it into his head to dream that he cuts the throat of another, he will certainly accomplish it if he can; but woe be to him in his turn, if another should dream that he is to revenge the murder of the deceased.

They may, however, easily extricate themselves out

of such difficulties, by opposing one dream to another, so as to seem to contradict it.

"I plainly see (says the dreamer, in that case) that your spirit is stronger than mine, so let us mention it no more." They are not all, however, so easily brought to relinquish their purpose, but in general a small present will satisfy them.

Their festivals make a part of their religion, and once we had an opportunity of seeing one of them. It began by a proclamation, made by the chiefs or elders of the tribe, and much formality was observed on the occasion. As soon as the proclamation was over, the men, women, and children, of the village, ran up and down almost naked, although it was then intolerably cold. At first they visited every cabin; then they wandered about for some time on all sides, without knowing whither they went, or what they would be at. One would have taken them for so many drunken persons or madmen, whom some sudden transport of frenzy had deprived of reason.

Many were satisfied with having indulged themselves in this piece of folly, and appeared no more during the rest of the entertainment. But the rest resolved to make use of the privilege of attending the festival; during which they appeared as persons out of their senses. This gave them an opportunity of shewing their mad airs, and playing their wanton tricks, and which, on this occasion, they did most effectually. Upon some they threw water by whole pailsful, which freezing immediately, pierced with cold those upon whom it fell. On others they threw hot ashes, or all manner of filth. Some threw firebrands, or burning coals, at the head of the first person they met. Others destroyed every thing in the cabins; fell upon those to whom they bore any grudge or spite, and loaded them with blows.

We were often on the point of being more than spectators of this extravagance. One of these savages came into a cabin where we had taken refuge at the beginning of the mad entertainment. Luckily for us, we made our escape out of a back door that led to the fields, otherwise we know not but the fellow might have done us a mischief. Disconcerted by our retreat, he called out that he wanted a person to interpret his dream, and that he would be satisfied on the spot. Some delay being made, he said, I will kill a Christian; and the owner of the cabin threw him a coat, which he stabbed several times. Then the person who had thrown him the coat, falling in his turn into a fury, cried out, that he would revenge the Christians, and that he would reduce the whole village to ashes. He began by setting fire to his own cabin, in which this scene had been exhibited, and every body having left it, he shut himself up in it. The fire, which was kindled in several places, had not as yet broke out, when one of our people went up, and was going to enter it, but being told what had happened, he broke open the door, laid hold of the Indian, thrust him out of the door, extinguished the fire, and shut himself up in the cabin. In the mean time the Indian ran through the whole village, crying out that he would set it on fire. A dog was then thrown to him, in hopes that animal would satiate his rage; but he said this was not sufficient to repair the injury that had been done him. At last they threw him the coat of a Frenchman, which he stabbed several times, and then he was satisfied.

This savage had a brother, who had likewise a mind to play his part in this mad, ridiculous ceremony. He accordingly dressed himself nearly in the same manner the satyrs are represented, being covered all over with leaves of maize. Two women attended him, with their faces blacked, their hair dishevelled, a wolf's skin over their bodies, and each had a stake in her hand. Thus escorted, he went through the village, into every cabin, howling and crying out with all his might. He climbed up the roofs, where he played a thousand tricks, with as much dexterity as the most experienced rope-dancer could have done. Then he sent forth the most dreadful cries, as if some great misfortune

misfortune had happened to him. Afterwards he came down, and walked gravely along, preceded by his two women, who being seized with the same phrenzy in their turn, overthrew every thing they met in their way. These were no sooner recovered from this madness, or wearied with the part they had acted, than another woman succeeded in their room. She entered the cabin in which we were sitting, armed with a musket, which she had received as a recompence for expounding a dream. She sung the war song, and declared she would make a great number of prisoners.

A warrior followed close after this amazon, with a bow in one hand, and a bayonet in the other. After he had made his throat sore with crying, he fell upon a woman, who was not in the least aware of it, held his bayonet to her throat, seized her by the hair, and having cut off a handful of it, walked out. Next appeared a juggler, holding in his hand a staff, adorned with feathers, by means of which he could divine the most secret and hidden transactions. An Indian accompanied him, carrying a vessel filled with some sort of liquor, of which he gave him a dose to drink from time to time. The impostor had no sooner put it to his lips, than he thrust it from him again, blowing on his hands and staff, and at each time explaining all such dreams and riddles as were proposed to him.

After this two women came, pretending that they wanted something. One of them immediately spread a mattrass on the ground, pointing out that she wanted some fish, which were immediately given her. The other carried a mattock in her hand, by which they conceived she wanted a field to cultivate; and her request was complied with, for she had one given her nearly adjoining to the village.

A chief had dreamed, that he saw two human hearts; and as this dream could not be easily explained, it created much uneasiness. This chief made a great deal of noise about it, so that the feast was prolonged for a day on that account, but all was to no purpose, for he was obliged to be satisfied at last. Sometimes were seen companies of armed men, as if they had been going to engage in war, and sometimes troops of dancers playing all sorts of antics. This madness lasted four days, and it appeared that the usual time of it had been abridged, out of respect to our company, who did not seem to relish it much. Indeed, it must be acknowledged, that they treated us with much more respect than we could have looked for among savages; but then it must be considered, that we did every thing in an inoffensive manner, in order to ingratiate ourselves into their favour.

Superstition hinders these savages from studying the nature of physic, or indeed, in a proper manner, any thing in the *materia medica*. Like all other ignorant creatures, they imagine, that diseases may be cured by charms or spells. They have vast numbers of impostors among them, like our quack doctors, and these observe a great number of ridiculous ceremonies.

On entering the cabin where the sick person lays, they take care to fix into the ground a piece of wood, to which a cord is made fast. They afterwards present the end of the cord to spectators, inviting them at the same time to draw out the bit of wood, and as soon as any one succeeds in the attempt, they are sure to tell him, that it is the devil who holds it. They then make as if they would stab this pretended devil, and loosen by little and little the piece of wood, by taking up the earth round it, after which it is easily drawn up, and all the time they cry out, A miracle! To this piece of wood is fastened a small bone, which the impostor takes in his hands, and pretends that he has, with it, knocked out the brains of the evil spirit.

This ridiculous scene lasted three hours, after which the physician wanted rest and refreshment. He went away, assuring them that the sick person would be infallibly cured; provided the disease had not already got the better, that is, if the devil, before his visit,

had not given him his death's wound. The grand article was, to know whether the devil had done his business effectually or not. This the quack pretended to discover by dreams, and forced interpretations put upon them; but they always take care never to speak clearly, till they find what effect the disease will have. This is really ingenious, and in all respects consistent with the characters of impostors in general. If they look upon the disease as incurable, they instantly go away; but when the patient languishes a few days, they are bold and impudent enough to say, that the devil will neither suffer him to die, nor be cured. In such cases, one of the nearest relations of the diseased pours cold water on his face, till he expires by suffocation. Here is murder *secundum artem*, or according to the rules of art: and thus we find, that the quacks among the American surgeons are as great villains as those in Europe. It is very remarkable, that among these savages the quack has his fee, whether he performs a cure or not; but it is quite different in some of the southern provinces, where the maxim is, *No cure, no pay*. This should afford a lesson to some of our noted physicians, who frequently, after the decease of the patient, spend an hour in disputing concerning the nature of that disease which put an end to his temporal existence. The late Mr. Henry Fielding has given us a satirical representation of this in his history of Tom Jones. The two physicians arrived some hours after captain Blifield was dead; and as they were afraid of losing their fees, they entered into an argument, whether he died of an apoplexy, or an epilepsy. Mr. Allworthy asked them, if the gentleman was dead? and being answered in the affirmative, he told them, it was needless to dispute any longer, but gave them their fees, and discharged them.

September 16. We left the fort on the river St. Joseph, and that day sailed six leagues. Towards evening we went on shore, and walked about four miles along the banks of the river. After that we crossed a field, and a copse of wood, which produced a very fine effect. It is called the Meadow of the Buffalo's Head, because it is said the head of one of these animals, of a monstrous size, was once found there. Perhaps there were some giants among these brutes. We have seen the skeleton in the Museum, brought over from America; but what creature it belonged to, has not yet been decided. This night we pitched our tents on a very beautiful spot, called the Fort of the Foxes, because a tribe of Indian knaves, by that appellation, had formerly a village here, which was fortified according to the manner of their country.

September 17. We walked a league further in the meadow, but were frequently over the feet in water. Afterwards we met with a pool, or marsh, that had a communication with several lesser ones; and the biggest was not above one hundred paces in circumference: these are the sources of the river Theakiki, which name, in their language, signifies a wolf, probably because the people are very fierce in their manners.

We put our canoe, which two men had carried thus far, into the second of these springs; and we embarked, but had scarce water sufficient to keep us afloat. Ten men might, in a few days, make a straight and navigable canal, which would save a great deal of trouble, and shorten the voyage at least forty miles: for the river, at its source, is so very narrow, and such short turns must of necessity be constantly made, that there is danger of damage every moment to the canoe. Of this we met with many striking instances; but some of these have been taken notice of already, and others will be mentioned afterwards.

Here we found the Indians very different from any we had hitherto met with. At the approach of death, we found them working themselves up to a sort of stoical apathy; and the most awful of all events that ever can take place in the natural world,

was by them considered as a matter of mere indifference.

With a pagan fortitude peculiar to themselves, they heard their funeral eulogiums pronounced without the least seeming degree of concern. If the patient is the father of a family, he calls his children together, and gives them his last advice how they are to conduct themselves in the world. He repeats all the heroic actions he has performed, and never forgets to repeat how many murders he has committed. He then takes leave of his friends, and promises to meet with his relations in the other world.

While this passes, they cut the throats of all the dogs they can catch, that the tongues of these animals, by their barking, may give notice to the people in the other world, that such a person is soon coming to take up his abode among them: and they throw all the bodies of the dogs into the kettle, to make a delicious feast of the flesh at the funeral of the deceased. The repast being over, and the dogs flesh eaten, they begin their lamentations, which are frequently interrupted by their taking their last farewell of the deceased; wishing him a good voyage, and comforting him on his separation from his friends and relations; assuring him at the same time, that his children will, by their heroic actions, support the dignity of his family and character.

This stoical intrepidity in fearing death in so unconcerned a manner ought not to be commended. The ancients themselves were serious when they met death; and the Almighty seems to have implanted it in our nature, that we should have just and awful notions of immortality. The Christian will meet death with a becoming resignation to the divine will; but he will not jest with it as Sir Thomas More did on the scaffold; nor as Rabelais, when the priests administered to him the extreme unction. Being asked if he thought himself dying, he answered, he did not know, but undoubtedly he was going on a long journey, for they had been just providing his boots. And being desired to make his will, he called for a proctor, and dictated to him the following words: "I owe a great deal, I have no money to pay my debts, and I leave the rest to the poor." This is entirely consistent with stoical intrepidity; and it may, with great propriety, be applied to those Indians of whom we have been writing, their general notions lead them to expect eternal happiness; so that they die just as they lived. However, if these people have such stoical notions concerning the dead, they do not treat their bodies with indignity. Some mothers have been known to preserve, for years together, the bodies of their deceased children; and others to draw the milk from their breasts and sprinkle it on their graves. If a village, in which there are any dead bodies, happens to be set on fire, whether by accident or design, the first thing done is to remove the corpses to a place of safety. They strip themselves of every thing most valuable about them, in order to adorn the deceased: they open their coffins from time to time, in order to change their habits; and they take victuals from their tables, and carry to them in their graves, and to those places where they imagine their souls frequent. In a word, they are more expensive on the deceased than on the living; than which nothing can be more ridiculous.

As soon as the sick person has expired, all the inhabitants of the village burst out into loud exclamations, which continue for a considerable time, or rather as long as the family can keep open house to the mourners. The dead body is adorned in its finest robes, the face is painted, and all his implements of war are laid by his side. It is customary, among some of the Indian nations, for the relations to fast till the funeral is over, all which interval is spent in weeping and howling, and in making their complaints to each other, in memory of the deceased. In some other nations they have mourners, who perform their parts exceeding well: they sing, they dance, they weep incessantly, and always in cadence; but this outward

shew of borrowed grief is not prejudicial to that which nature exacts from the relations of the deceased.

So far as we could learn, they do not use a great number of ceremonies in the interment of their relations, but when they are laid in the grave, they take care to cover them in a decent manner. They do not suffer the earth to touch them, but cover them over in a thing bearing some resemblance to a cell or vault. Over every grave they erect a sort of wooden pillar, or rather a post, and sometimes they carve the figure of the deceased upon it.

October 17. We set sail again, but the frost was so violent, that we were much impeded in our journey, or rather our voyage. The next day we sailed from morning till night, being much favoured by a strong current, and sometimes by the wind. We made indeed a great deal of way, and yet the regularity in our sailing did not carry us far in our course; for after having sailed above thirty leagues, we found ourselves so near our first encampment, that from the one place to the other we could have seen one another, or even conversed together, at least by means of a speaking trumpet.

We were a little comforted for this inconvenience by the extreme plenty of game in the river, and its wild banks, which were then fattened by the wild oats, then in their maturity. We proposed gathering some grapes, of the size and figure of a musket ball; but when we tasted them, we found them extremely disagreeable. Here we found the river much contracted from what it was before, but the banks were so pleasant that the prospect exceeded all manner of description: there were vast numbers of trees, which added to the beauty of the prospect; and they were so near the water, that we could sometimes pull the leaves off them.

We sailed fifty leagues up the river before we got rid of all these difficulties, and then we found ourselves in a small lake. Here the country has a more beautiful appearance, consisting of unbounded meadows; and in this spot buffaloes are to be seen in two or three hundreds together. But it is very necessary to keep a good look out, lest the Indians, who are extremely cunning, should come down and surprize travellers.

One great misfortune to us was, that the river Theakiki became shallow as it increased in breadth, so that we were often obliged to unload the canoe, and travel on foot, which is never done without some danger; by which means we should have been greatly embarrassed, if we had not been furnished with an escort from St. Joseph's.

We were much surprized to find so little water in the river at this place, especially as it receives a great many springs, and small rivers are continually pouring themselves into it. We were here shewn a place where two parties of Indians once met, and fought so furiously, that the conquerors did not leave one of the conquered alive. This barbarous manner of fighting is very common among these savages, who know nothing at all of the law of nations, but either kill their enemies on the spot, or reserve them for a more dreadful fate.

The next place we arrived at is called, by the Indians, the Forks, because the Theakiki and the Illinois rivers here join together in the shape of a fork. The Illinois river, although near two hundred miles from its source, is here extremely shallow, so that we frequently saw buffaloes cross it without being up to the middle in water. On the other hand, the Theakiki, although it runs above three hundred miles, yet is deep and extremely beautiful. Here, however, it loses its name, because the Illinois having made some settlements on its banks, they have given it a name in their own language. At its mouth is a fall of a rapid stream, called the Coal Pit, from the great quantity of coal found in the places adjacent. Nothing is to be seen in its course, but spacious meadows interspersed with small copses of wood, which seem to have been artificially planted. The grass is so very high, that a
man

man is lost among it, but paths are every where to be found, as well trodden as they could have been in the best peopled countries; though seldom any creature passes that way except buffaloes, and from time to time some herds of deer, and a few roebucks.

About a league below the coal-pit, is a rock extremely high, and its summit in the form of a terras. It is called the fort of the Miamis, because an Indian tribe of that name had formerly a village here. A league beyond this, on the left, is seen another rock, quite similar to the former, and which has obtained the simple appellation of the Rock. This is the point of a very high terras, stretching the space of two hundred paces, bending or winding with the course of the river, which is very broad in this place. This rock is steep on all sides; and at a distance, one would take it for a fortress. Some remains of a pallisado are still to be seen on it, the Indians having formerly cast up intrenchments here, which might be repaired at a very small expence.

The village of these Indians stands at the foot of this rock, in an island, which, together with several others, all of a wonderful fertility, divides the river in this place into two pretty large chanel. About four in the afternoon, we went on shore, where we met several of our countrymen, who were trading with the Indians. We had scarce landed, when we received a visit from the chief of the village, a man about forty years of age, well made, of a middle stature, a good countenance, a mild temper, and in all respects well esteemed both by the French and other Europeans.

We went up the rock by a pretty easy ascent, although extremely narrow. There we found a level terras of a considerable extent, where twenty men might defend themselves against all the Indians in Canada, provided they had fire arms, and could be supplied with water, but that is only to be had from the river; and to obtain it, they would be obliged to expose themselves. The only resource of the besieged would be the natural impetuosity of these barbarians. In small parties, they will wait for eight or ten days together behind a bush, in hopes that some one may pass, whom they may kill or take prisoners; but in large bodies, if they do not succeed at first, they are soon tired, and lay hold of the first opportunity to retire; which opportunity is never wanting, because a dream, whether real or pretended, is all that is necessary for that purpose.

Here we saw a most dreadful spectacle indeed. At the extremity, and just above the village, we saw the remains of the bodies of two Indians, who had been burnt a few days before, and their remains were left to be devoured by the birds, in the same posture in which they had been executed. The manner of securing prisoners in these southern countries, is somewhat singular, and they have some customs different from the others in their manner of treating those unhappy wretches.

When they meet with success in any military expedition, the warriors contrive their march in such a manner, that they always arrive at the village in the evening. As soon as they are come near it, they halt; and when night is come, depute two or three young people to the chief, to inform him of the principal events of the campaign. On the morrow, at day-break, they bring out their prisoners, and dress them in new robes, comb down their hair, paint their faces with different colours, and put into their hands a white staff, surrounded with the tails of deer. At the same time the war chief shouts, and the whole village assembles at the water side, if they happen to be near a lake or river.

As soon as the warriors appears, four young persons well dressed embark on board a long sort of boat made of a single tree, and this they call a Pirogue. The two first carry each a musical instrument, called a calument, and proceed, singing at the same time, to fetch the prisoners, whom they conduct as in triumph to the cabin, where they are to be judged. The master of the cabin, to whom it belongs to determine their

fate, begins with giving them something to eat, and holds a council during the repast. In case they grant any one his life, two young persons untie him, and each of them takes him by the hand, and so make him run with all his might towards the river, into which they throw him headlong. They also throw themselves into it after him, and when they have well washed him, conduct him to the person whose slave he is to be.

As for those who are condemned to die, as soon as sentence is pronounced, the cry is made for all the people in the village to assemble together, and the execution is put off no longer than the necessary preparations are made. They begin with stripping the sufferer stark naked; they then fix two posts in the ground, to which they make fast two cross pieces, one seven feet from the other, and this is what they call a square. They cause the person who is to suffer, to mount the first piece, to which they tie his feet at some distance from each other. They afterwards bind his hands to the two angles, formed by the upper cross pieces, and in this condition they burn him in all the parts of his body.

The whole village, men, women, and children, crowd round him, every one being at liberty to insult and torment him at pleasure. If none of the spectators have any particular reason to prolong his torments, then his sufferings are soon over; and the common way is to dispatch him with arrows, or else they cover him with bark, to which they set fire. They then leave him to himself in his square, and in the evening visit all the cabins, striking with rods against the furniture, walls, and roof, in order to frighten the soul of the deceased from harbouring there, to revenge the mischiefs done to the body, and the rest of the night passes in merriment.

If the party hath met with no enemy, they return to the village in the day-time, observing a profound silence; but if they have been beaten, they make their entry in the evening, after having given notice of their return by a death cry, and naming all those whom they have lost either by sword or by sickness. Sometimes when they arrive at the village, the prisoners are immediately judged and executed, especially when they are afraid of their being rescued. There are several other barbarities committed by these savages; but as some of them have been mentioned already, and others will be taken notice afterwards, we need not mention any thing of them here.

We remained twenty-four hours on the rock, and, to oblige the savages, who treated us with great kindness, we lay one night in their chief cabin, which was in the middle of the village. We passed part of the night quietly enough, but were awakened early in the morning by a woman, who lived in the next cabin. This woman happened to remember a son whom she had lost some years before, and she immediately fell a howling in a most dreadful manner, so as to make us really afraid. As these savages were suspected to be thievish, we caused all our baggage to be carried over to the other side of the river; but notwithstanding all this precaution, when we came to examine the different articles, we found a musket and several other things had been stolen from us. The same evening we passed the last part of the river, where we were obliged to carry our canoe; and from this place forward it is equal in breadth and deepness to most of the rivers in Europe.

On this day we saw parrots for the first time; but they were only stragglers, who had come from the Mississippi. They were no bigger than a common blackbird; their heads were yellow, with red spots in the middle; the rest of their plumage being a deep predominant green. The two following days we crossed a most charming country, and on the third of October, towards noon, found ourselves at the entrance of lake Pimeteouy. This lake is only a widening of the river, which, for about ten miles in length, is three miles in breadth.

Nothing can be more delightful than the situation
10 E of

of this place; and opposite to it is the prospect of a most beautiful forest, which was then adorned with all the variety of colours; and behind it was a plain of vast extent, skirted with woods. The lake and river swarms with fish, and the banks of both with game. In this village we met with four French Canadians, who told us, that we were between four parties of enemies, and that we could neither go backwards nor forwards with safety. They also told us, that on the way we had come, there was an ambuscade of Indians, and that an equal number were hovering about the village of Pimeteouy. They added, that a few miles below, on the banks of the river, there was a third party of these savages, being no less than fourscore in number, so that we were in great danger.

This account made us reflect on what had passed the evening before. We had slept at the extremity of an island, to look for buffards, at which some of our people had fired; and we heard somebody cutting wood not far from us. The nearness of the village made us believe that these were Illinois; and we were pleased with this thought: but there was reason to believe they belonged to a different nation of savages. However, we were not so much afraid of them, because we had twelve armed men along with us, commanded by a person who was well acquainted with the place.

What confirmed us still more in the belief of the Frenchmens story was, that thirty warriors of Pimeteouy, and these too commanded by the chief of the village, were in the field, to try to get more certain information of the enemy; and that only a few days before their departure; there had been a sharp engagement in the neighbourhood, in which many persons had been taken on both sides. One of these prisoners had been burnt alive, at the distance of a mile and a half from the village; and the Canadians, who were present at his execution, told us, that they kept him in torments six hours.

It seems he had fought with great valour, and had it not been for a wound he received in one of his legs, he had not been taken. In the midst of his torments he made it appear, that bravery, and the courage to endure pain, are two very different things, and not always found in one and the same person; for he uttered the most lamentable shrieks, which only served to animate his tormentors. It is true, an old Indian woman, whose son had been killed, did him all the injury she could; but at last, taking pity upon his cries and lamentations, they covered him with straw, to which they set fire; and as he was still found to breathe, after that was consumed, he was pierced with arrows by the children. For the most part, when a victim does not die like a brave man, he receives his death's wound from a woman, or from children; for they consider him as unworthy of dying by the hands of men.

Under all the circumstances already mentioned, we found ourselves much embarrassed; on the one hand, our guides did not think proper to advance any further; and on the other, it was very inconvenient for us to winter at this place. However, the Canadians having consented to join our company, we resumed new courage, and determined to set out on the fourth of October, although there had been a great fall of rain.

In the afternoon, the warriors, who had gone out on the discovery, returned without raising any shouts, because they had seen nothing. They all filed off before us with a pretty fierce air, being armed only with arrows, and a buckler of a buffalo's hide; and they took no notice of us, for while they are under arms, they never take notice of any one. As soon as they had returned to their cabin, the chief came, out of respect, to visit us. He was about forty years of age, of a good stature, a little thin, of a mild disposition, and seemed to have a large share of good sense. He was reckoned the best soldier in the nation, and had frequently beat the nations of the other parts.

Perceiving a cross of copper, and a small image of the blessed virgin, suspended at the neck of this Indian, we began to imagine he was a Christian; but was informed it was quite otherwise, and that he had dressed himself in that manner only to do us honour. We were likewise told a story, which we do not assert as a fact, but leave every one to judge of it in what manner they think proper.

This image of the virgin, which the Indian wore; having fallen into his hands by means with which we were unacquainted, he was curious to know something concerning it. He was told that it represented the mother of God; and that the child she held in her arms, was God himself, who had made himself man for the salvation of the human race. The mystery of his incarnation was explained to him in a few words; and he was further told, that in all dangers the Christians constantly addressed themselves to the holy mother, who seldom failed to extricate them out of their difficulties. The Indian listened to this discourse with a great deal of attention, and sometime afterwards, being hunting by himself in the woods, an enemy, who had been lying in wait, came upon him, as soon as he had discharged his piece, and attempted to fire his own at him. Our Indian recollecting what he had been told concerning the mother of God, invoked her protection, and his enemy's piece missed fire. He cocked it five different times afterwards, but it would not go off. In the mean time, our Indian chief would have shot his enemy, but he surrendered himself a prisoner. From that time forward the chief would never stir out of his village without his image, and before we left the country, he was so well convinced of the efficacy of the image in granting him protection, that he embraced the Christian religion, and was baptized.

Scarce had this chief left us, when taking a walk out to view the village, we perceived two Indians going about from cabin to cabin, and making lamentations, nearly in the same manner as the women already mentioned. The one had lost his friend in the last expedition, and the other was the father of the deceased. They walked at a great rate, laying both their hands on the heads of all they met; probably, to invite them to take part in their grief, which is, in many respects, consistent with the customs of the Jews of old.

Towards evening the chief sent us an invitation to meet him at a house where one of our missionaries had lodged before, and where they used to hold their councils. Thither we went, and found him with some of the elders. He began his discourse by telling us of the many dangers to which we would be exposed, if we persisted in continuing our journey; and then he advised us to remain in his village during the winter. Suspecting that he might have some interested views in detaining us, we gave him to understand that his arguments could have but little weight with us; and declared that we had still some stronger ones to hasten our departure. This answer seemed to give him some pain, and we soon perceived that it proceeded from a real affection for us. He told us he had nothing in view but that of serving us, and we were charmed with his good sense and generosity.

We made him a great many acknowledgments for all his generous offers, and assured him we would never forget his kindness. This satisfied him, and he did not continue to press us any further. Next morning he came to visit us, attended by his mother-in-law, who carried a little infant in her arms, and he addressed us in the following words:

“ You see before you a father in great affliction. Behold my daughter, who is a dying; her mother having already lost her life in bringing her into the world, and none of our women have been able to make her take any nourishment. She throws up every thing she swallows, and has, perhaps, but a few hours to live: you will do me a great favour if you will baptize her, that she may see God after her death.” The child was indeed very ill, and appeared to be past all hopes of recovery; so that without any hesitation we baptized

baptized her. This gave us great pleasure, because if nothing else material had happened in our journey, this would have made amends for every disappointment, as we had ushered the child into the kingdom of heaven.

October 20. We set out from Pimeteouy, but were far from being so undaunted as we pretended to be. The alarm in which we found the Illinois, their mournful songs, the sight of the dead bodies of vast numbers of prisoners, which every moment presented themselves to our view, filled us with horror, not knowing how soon it might be our own fate to undergo the same excruciating tortures as those people had suffered.

It is true, indeed, we did not dread an open attack by the enemy, because we had fourteen men well armed along with us; but every thing was to be feared from surprize, there being no fatigue but the Indians will undergo in order to draw their enemies into the snares laid for them: one of the most common is, to counterfeit the cry of some wild beast, or the voice of some bird, in the imitation of which they are so dextrous, that people are every day deceived by them. For instance, being encamped at the entrance of a wood, they imagine they hear the cry of a buffalo, deer, or wild duck, two or three run thither in hopes of finding game, and are generally knocked on the head.

Continuing our journey, we perceived on the sixth a great number of buffaloes swimming across the river with a great deal of precipitation, occasioned, as we thought, in consequence of their having been pursued by an enemy. This obliged us to go on during the whole of the night, to avoid such dangerous enemies as we naturally imagined those Indians were, who had pursued the harmless creatures.

Next day, early in the morning, we passed by Saguinton, a large river that comes from the south; and twenty miles below that we passed a small river, called the river of the Macopines. Adjoining to these rivers are some fine plantations and meadows, which afford agreeable prospects, being covered with all that verdure which the hand of Providence takes pleasure to bestow on the children of men.

Soon after we had passed this place we perceived the banks of the Mississippi, which are extremely high, and are seen at a vast distance. On the ninth of this month we found ourselves just upon the entrance of this river, which has been so much celebrated all over Europe. There are large extensive mines of copper on the banks, and nothing can be more delightful than the prospects which continually present themselves to those who are sailing up the river. The scene is so variegated, that the beauty of the prospect is heightened. On the right are flat meadows; and on the left rocks, covered in many parts with woods, particularly with cedars, which have a fine effect.

On the tenth, about nine in the morning, we arrived at the mouth of the Missouri, and here is the finest confluence of two rivers that are to be met with in the world, each of them being a full half league in breadth; but the Missouri is by far the most rapid of the two, and seems to enter the Mississippi like a conqueror, carrying its white water, unmixed, across its channel quite to the opposite side. This colour is afterwards communicated to the Mississippi, which henceforth it never leaves, but disembogues itself into the sea.

This night we lay in a village belonging to the Illinois, situated on a small river, which runs from the east, and has no water but in the spring season, so that we were obliged to walk above two miles before we could get to our cabins. We were astonished to think they had pitched upon so inconvenient a situation, especially as they had so many better in their choice; but were told, that the river washed the foot of that village when it was first built; that in three years it had lost half a league of its breadth, and that they were thinking of seeking out for a more agreeable place to erect a village on for their common residence,

a circumstance that these savages in America pay but little regard to.

This night we lodged at the house of a missionary, who treated us with every mark of respect; and next day we continued sailed down the river, where many beautiful prospects presented themselves to our view. In one place we found the people engaged in looking for a silver mine, but we could not learn that it answered their expectations. The circumstances relating to this affair of the mine are as follow:

In 1719, Mr. Locliou, a French gentleman, was sent to Canada to make discoveries concerning mines; and having dug up a place that was marked out for him, drew up and extracted a pretty large quantity of ore, a pound whereof, which took up four days in melting, produced two drachms of silver; but some suspected that he had put in the same quantity of silver himself. A few months afterwards he returned thither, and without thinking any more of the silver, he extracted from two or three thousand weight of ore fourteen pounds of very bad lead, which was attended with an enormous expence. Disgusted with such a labour, which was so unprofitable, he returned to France, and the affair was neglected ever afterwards.

The company, persuaded of the truth of the informations, induced the proprietors of the place to send a Spaniard to complete what the Frenchman had left unfinished. They appointed him a considerable salary, but he had no better success than the Frenchman. About this time a third company of the French king's miners arrived, under the direction of a Frenchman, who resolving to begin with the lead mines, was able to do nothing, because neither himself, nor any of his company, were in the least acquainted with furnaces. Nothing could be more surprising than the facility with which the company at that time exposed themselves to; the great expences, and the little precaution they took to be satisfied of the capacity of those they employed. They found a bed of lead, but it never answered any end.

It was necessary to say the more concerning these interior parts of North America, because some writers have delivered very erroneous accounts, whereas we relate only what we either saw, or had committed to us by persons who were superior to falshood or deceit. The historian who has no regard to his conscience, has generally as little for his honour. As conscience induces writers to retain nothing but the truth; so a regard to his honour will keep him upon his guard, lest his character should suffer when his works are published after his death. These things, if properly attended to, would prevent people from imposing spurious accounts of places and things on their readers, and history would assume her antient lustre. But we must return to the subject.

The next day we arrived at Kaskaskias, about nine o'clock in the morning. The Jesuits have here a very flourishing mission; which has been already divided into two, thinking it convenient to have two cantons of Indians instead of one. The most numerous is on the banks of the Mississippi, of which two Jesuits have always the direction. Half a league below stands fort Charteres, about the distance of a musket-shot from the river.

Four leagues farther, and about a league from the river, is a large village, inhabited by Canadian French, who have Jesuits for their priests. Another village, belonging to the Illinois, lies farther up the country, at the distance of two leagues from this, and is under the direction of another Jesuit, who has converted the greatest number of the inhabitants to the Christian faith.

The French at this place live pretty much at their ease; and a Fleming, who was a domestic belonging to the Jesuits, taught them how to improve the ground in a proper manner. The Indians cultivate their grounds in their own manner, and are very industrious. They likewise bring up vast swarms of poultry, which they sell to the French; and here we found their women extremely neat, and ready to put their hands to

any sort of domestic work: They spin the wool of the buffaloes, which they make as fine as the worsted made of the wool of English sheep; nay, sometimes it is as fine as silk. Of this they manufacture stuffs, which are dyed black, yellow, or a deep red. Of those stuffs they make robes, which they sew with thread made of the sinews of roe-bucks. The manner of making this thread is very simple; for after stripping the flesh from off the sinews of the roe-bucks, they expose them to the sun for two days together. As soon as they are dried they beat them, and then without any difficulty draw out a slender thread, as white and as fine as that of which Brussels lace is made.

The French canton is bounded on the north by a river, the banks of which are extremely high, so that though the water rises sometimes five or six feet, yet the grounds are seldom, or perhaps never, overflowed. All this country is open, and adorned with fine meadows, to the extent of eighty miles, which are interspersed with copses of very valuable wood. White mulberries are very common here; but what is very surprising, the inhabitants know so little of the value on them, that they cut down the trees to make their huts; and this is the more remarkable, because they have all sorts of wood more proper for that purpose.

There are three sorts of fruit here, which seem to be peculiar to this country; these are the pacana, the acimine, and piakinie. The pacana is a nut of the size of a large acorn; the shell of some of them being very thin, while others have it harder and thicker, but the fruit is the smaller on that account. They have a very thin delicate taste, and the tree rises to a great height. In its wood, bark, smell, and leaves, it has a near resemblance to the filbert-trees in Europe.

The acimine is a fruit of the length of a man's finger, and a full inch in diameter. The pulp is tender and sweetish, and full of a seed much resembling that of the water-melon. The tree grows to no great height or thickness; for all those we saw were little better than shrubs, the wood of which was very tender. Its bark is thin, its leaves long and large, like those of chestnut, but of a deeper green.

The piakinie is in shape like a dark plum, though somewhat larger. Its skin is tender, its substance watery; the colour red, and has, besides, a very delicious flavour. It contains seeds, which differ only from those of the acimine in being somewhat smaller. The Indians make a paste of this fruit, which they bake into loaves of the thickness of a man's finger, and of the consistence of a dried pear. The taste seems at first somewhat disagreeable, but people are easily accustomed to it. It is very nourishing, and a sovereign remedy, as they pretend, against a looseness and a bloody flux. The tree which bears this fruit is a very fine one, and about the size of our ordinary plum-trees. Its leaves have five points; its wood is of a middling hardness, and its bark very rough.

A little above this place we met with several Indian tribes, who had been hitherto unknown to the French. All these Indians dwell on the water banks of the Mississippi, except one tribe, who live on the east. Here a vast number of rivers fall into the Mississippi, which increases the stream to an amazing breadth, and gives it a most majestic appearance to the traveller.

Turning to the left from this place, we entered what they call the Blue River, from the colour of its bottom, and it discharges itself into the river St. Peter. Travelling further up the country, we found a vast number of coal-pits, but few of them were worked in a proper manner. We were told, that there were many medicinal herbs here, but we did not see any that deserved notice.

On the eleventh of November, at sun-set, we embarked on the little river Kaskagias, and though it was not above two leagues from the Mississippi, yet we were obliged to encamp at half-way, and the next day we could get no more than six leagues down the river. The leaves fall sooner in this place than in France, and yet they do not begin to bud till about the latter end of May; notwithstanding that, it sel-

dom blows cold here, for in general the winters are very temperate. What then can be the reason of this backwardness of the spring? All we could conceive was the thickness of the forrests, which prevents the earth from being warmed by the sun soon enough to cause the sap to ascend.

On the twelfth, after having advanced two leagues, we passed Cape Anthony on the left hand. Here the first leaves are seen, and bear some resemblance to those in Europe, but they are taller and stronger. When the cane lands are to be cleared, the canes are not to be plucked up by the roots, which would indeed be a very difficult task, their knotty roots lying very deep, and being twined or linked together by a great number of fibres, which extend very far. These roots have naturally a beautiful varnish, resembling in some manner the bamboos of Japan, of which those fine canes are made, which the Dutch sell under the name of rattans.

When a field, overgrown with these canes, is to be cultivated, it is sufficient to cut them close to the ground. They are afterwards left to dry, and then set on fire, the ashes serving for manure, and the fire for opening the pores of the earth, which is afterwards filled up, and sown with maize, rice, water melons; and, in a word, with all sorts of grain and pulse, excepting wheat, which in those fat lands exhausts itself by running up into straw, without producing grain. This defect may be easily remedied, by covering the ground with sand, and sowing it with maize and Indian corn.

The high lands, and other kinds of soil not liable to be overflowed by the river, are very well adapted for producing corn, and if the meal made in some places has not succeeded, because the grain has been frequently blasted, yet this is not a proper discouragement to hinder the people from seeking to promote honest industry.

On the fourteenth, after a very warm night, we advanced three leagues in spite of a southerly wind, which still increased, and at last became so violent, that we were obliged to halt. A heavy rain fell towards the evening, and about midnight the wind sprung up at north-west, which brought on an excessive cold. To complete our misfortune, an accident detained us all the following day, though we were not safe to remain where we then were. Not long before we visited this place, the Indians massacred, just on the banks of the river, thirty Frenchmen, and we did not know how soon this might have been our own fate.

On the fifteenth, the wind changed to the north, and the cold continued to increase. We advanced four leagues to the southward, and then found that the river ran four leagues more towards the north. Immediately after this uncommon winding, we passed on the left the fine river Ouabache, by means of which there is a passage as far as the country of the Iroquois, where the waters are high. This river, at its entrance into the Mississippi, is not less than a quarter of a league in breadth; nor is there a place in all Louisiana more proper for making a settlement than this. The whole country around is beautiful and fertile, and, if well cultivated, would become one of the finest in the world. If a fort was erected here, it would keep the Indians in awe, and open a communication with Canada.

Six leagues below the mouth of the Ouabache, and on the same side, we found the coast extremely high, and the earth of a yellow colour, from whence some have imagined, that there are some iron mines in this place. No attempt however has as yet been made towards improvements, because suitable encouragement has never been given.

On the sixteenth we made a considerable progress, but suffered much from the cold. It continued to increase for several days, though the wind changed to the south-west: we were frequently obliged, as we advanced, to break the ice which was formed on the surface of the water. On the nineteenth, we got four leagues

leagues farther on our way, after which we were stopped by a south wind, and we never found a north wind colder than this. It is probable this was still the north-west wind that continued to blow, but that the land refreshed us sometimes on one side, and sometimes on the other, according as our course lay upon the river. The frequent turnings and windings of these rivers are attended with vast difficulties to those who fail up them; and it is indeed difficult to form an opinion of the wind, seeing it changes so often.

There are here a species of wild cats, called Pijoux, and they are extremely numerous: they bear a great resemblance to our cats in Europe, but they are larger. We observed that some of them had very short tails, and others much longer and thicker. They have likewise a very fierce look, and are so ravenous, that it is dangerous to come near them. All the forests in this part of the country are full of walnut trees, resembling those in Canada; and their roots are said to have several valuable qualities. The wood is soft, and the bark affords a black dye, but their principal use is in medicine. They are used in the case of fluxes and all other disorders that, in their operations, relax the animal frame.

On the twentieth, there was a great fall of snow; so that we did not stir from the place where we were all that day; but next day it grew milder, which, however, was not of long continuance, for the following night there was a most violent frost. This frost was so intense, that our brandy became as thick as oil, and our wine had a thick ice upon it. The farther we continued our course, the more windings we found in the river, the wind following us; and from whatever side it came, the cold was excessive. The natives told us, that the oldest man in the country had not been able to remember any thing like it.

This day we perceived a post erected on the right side of the river, and, on taking a near view of it, we found that it had been set up by the Illinois, on account of an expedition they had made sometime before, against the Chichachas, a fierce tribe of Indians. There were two figures of men without heads, and some others entire. The first represented the dead, and the other the captives. One of our guides informed us that, when any French were amongst either, they were represented with their arms upon their haunches, in order to distinguish them from the Indians, whose arms were left in a hanging posture. This distinction is not merely arbitrary, but proceeds from their having observed the French make use of this attitude frequently, which is never done by the Indians.

On the twenty-third, after a very bad night, we had a fine pleasant day; and although the ground was still covered with snow, yet the cold was not severe. The next day we passed by what is called the River of the Chichachas, which is but narrow, though it has a long course. Its course lies north and south, and from hence to Keiskaquias is reckoned two hundred miles; but the way by land is much shorter. Nothing could have been more agreeable than this navigation, had the season been milder. The country is delightful, and in the forests are vast numbers of evergreens; the meadows there likewise preserve their verdure; and a considerable number of well wooded islands, some of which are large, form very beautiful canals, through which large ships may pass in safety; for it is affirmed that there is sixty fathom water in this river, above four hundred miles from the sea.

As to the forests that almost cover this universal country, there is nothing perhaps in nature comparable to them; whether we consider the size and height of the trees, their variety, and the advantages that may be drawn from them; for, excepting dye wood, which requires a warmer climate, there are hardly any sorts of wood that can be mentioned which are not to be found here. There are forests of cypresses thirty miles in extent, all the trees of which are of a thickness proportionable to their height, surpassing every thing we have of that kind in Europe. All

sorts of nut trees are likewise to be found here in great perfection, and likewise all sorts of wood fit for carpenters use.

December 20. We arrived at a village called Akanfas, situated in a meadow on the western banks of the Mississippi. There are three other villages within a short distance, each of them belonging to different tribes of Indians, but they all live in friendship together. The French have a factory here, to carry on trade with the Indians; and they have likewise a magazine and a warehouse; but by some sort of bad management it has never yet answered their end, by turning out to their advantage.

The river Akanfas, which is said to have its rise at a great distance, discharges its water into the Mississippi at two mouths, about twelve miles from each other. This river, it is said, has its rise in the country of a nation of Indians called Black Paris, who are but little known to the Europeans. It is very difficult to get up this river, on account of the many rapid falls of water; and in some places it is so shallow, that travellers are frequently obliged to take their canoes on shore.

This great river, the Mississippi, divides, about twenty miles above the second and last of its mouths, and at the distance of only six miles from the first. Here the White River falls into it, which is a most beautiful stream indeed, and takes its name from the country of the Osages. A few leagues higher is a nation of Indians, called the Kappas, who were formerly very numerous, but they have been much weakened by frequent and cruel wars.

It was to this place that nine thousand German Palatinates were to have been sent, and it has been a great loss to the place that the design miscarried. There is not, perhaps, in all Louisiana, a country that could be cultivated to better advantage than this spot; and had these Germans been permitted to settle in it, there is no doubt but they would have improved it in such a manner as to enrich the colony. It is probable it will be a long while before such another opportunity offers, for European politics are not always found.

Some time before our arrival, a Frenchman passing this way was seized with the small pox, and the infection was connected to a whole tribe of Indians, who almost all died of it. The burial place appeared like a wood of stakes and posts newly erected; on which was suspended almost every thing in use among these barbarians.

We pitched our tent very near the village, and all the night we heard nothing but weeping; in which the men joined as well as the women, incessantly repeating the word *nibahani*; a term we had often heard before amongst them, and which, as we were informed, was used to express the greatest severity of their sorrow for the death of their relations.

The evening before we saw a woman weeping over her son's grave, and strewing it with flowers. Another had lighted a fire beside a neighbouring tomb, probably, according to their notions, to warm the deceased person. These Indians are reckoned the tallest and most handsome of any who reside in this part of North America, and therefore the French call them the fine men.

December 30. We set out from the village of Ouyapes somewhat late in the evening, and pitched our tent that night a little below the first mouth of the river Akangus, which seems to be about five hundred paces in breadth. Next day we passed the second, which was very narrow, and on the fifth, got as far as Cut Point. This point is high, and runs out into the river on the next side; and the river has cut it in such a manner, that it resembles an island; although the new channel is not as yet navigable, unless where the waters are high. From this place to the principal branch of the river of the Akangus, is reckoned sixty miles; but it would not be so much, were it not that there are so many springs.

The entrance into the river of the Yarfons lies north-west and south-east, and is about two furlongs in breadth. The waters are of a reddish colour, and are said to affect all those who drink them with the bloody flux: but this we had no experience of, only that the air and soil are both unwholesome. We had three leagues to travel before we came to the court, which we found all in deep mourning, on account of the death of Mr. Bizant, the governor. This gentleman had a most excellent character, and was beloved and esteemed by every one who knew him. He was a native of Canada, but his father was a Switzer, having been several years governor of Montreal. The young gentleman was brought up in the army; and such was the piety of his disposition, and sweetness of his manners, that he endeared himself to all the Indians without distinction, whether they were Heathens or Christians.

There are a great many alligators in this river, and we frequently saw some fifteen feet in length. They are never heard but in the night time, and their cry so much resembles the bellowing of bulls, that people are frequently deceived by it. Our people however paid so little regard to them, that they bathed here as frequently as if they had been in Europe. On expressing our surprise at this, we were told, they had nothing to fear; for although there were many of them in the water, yet they seldom meddled with any one, unless they were trod upon, or otherwise hurt. The moment of danger was upon their leaving the water, when the alligators are sure to watch their opportunity, to see if they can devour the person who has been swimming. To avoid this, the swimmer has a stick near the banks of the river, which he lays hold of, and makes such a splashing in the water, that the creature is frightened away.

The company have a warehouse at this place, under the direction of the king; but there is another belonging to private persons, where national laws do not take place. It is certainly a matter of great importance to secure this river, the source of which is not far from Carolina; but a fort, with a good garrison, would have been sufficient for this purpose, as well as to keep the Yafacaw Indians in awe, who are a very fierce people.

On the tenth, we left the Yafacaws, and on the thirteenth, had it not been for the assistance of an Indian, who begged to have his passage along with us, we should have been drowned in a whirlpool, with which none of our guides were acquainted, and which cannot be perceived, till one is so far engaged that it is difficult to get out. It lies on the east side of the foot of a large cape, where it is said there is a very grand stone quarry. These quarries are much esteemed in this country; but the people are at all times able to dispense with the want of them, because they have so much clay, that they can easily make bricks.

On the fifteenth, we arrived at the Natchez, a small canton, but finely situated, and the ground around it is extremely fertile. The landing place is opposite a high and rugged bank, at the foot of which runs a small rivulet, which however is capable of receiving small vessels. From this first bank we went up to a second, or rather a hill, whose ascent is tolerably easy, on the summit of which stands a redoubt, inclosed by a single palisadoe.

Several little hills appear above this, and when these were once past, we saw on all sides very large meadows, separated from one another by small copses of wood, which produce a very fine effect. The trees most common in these woods are the oak and the hazel, and the soil is every where excellent.

The first night we lay in this settlement, there happened a great alarm about nine o'clock in the evening. Upon asking the reason of it, we were told, that there was in the neighbourhood a wild beast of an unknown species, and of an extraordinary bulk, whose voice did not resemble that of any other creature they were acquainted with. No one, however,

could say he had seen it, and they formed a judgment of it entirely from the strength of its voice. It had already carried off some sheep and calves, and worried some cows. We told some of the people, that an enraged wolf might have done all this mischief; and that as to its cry, people were deceived in these matters every day. We could not, however, persuade them to hearken to reason; they still believed it was some monstrous beast, which had never been seen in the country before, and every one ran out with what he could find, but all to no purpose. What the creature was we could not learn, but probably it was a wolf, who by hunger had been driven in that inclement season to seek for a subsistence, and as soon as he was satisfied he retired.

After undergoing many fatigues, and suffering almost innumerable hardships, we arrived at the famous city of New Orleans. This is the first city which one of the greatest rivers in the world has seen erected on its banks. It has five parish churches, and as it has had a more auspicious beginning than even Rome herself, consequently it bids fair to become, in time, a flourishing capital.

When we arrived at this place, we found a vast number of Indians converted to the Christian faith. Many of these had lived together, and had children, without being married; and such came to us, telling us, that they were willing to continue together for life, begging we would marry them. This we thought extremely reasonable; for as the evil had been already done, our best way was to join them together in the holy state of matrimony. After this we heard their confessions; but the number was not so great as we expected.

The country in the neighbourhood of New Orleans has nothing in it remarkable, nor did we find the situation of this city so advantageous as might have been expected from the pretended descriptions we had read. A league beyond it, towards the north-east, there is a small river, called St. John's, which, at the end of two leagues, discharges itself into the lake Pontchartin, which has a communication with the sea.

A little below New Orleans, the soil begins to grow barren, and continues so all the way to the sea. Here is a point of land, which seems to have been found by the sea's retreating, and leaving an empty space; for wherever the ground is digged, salt water springs up. Indeed, according to all the accounts we have of the mouth of this river, it was different in former times from what it is at present. It is in this manner that most of these points of land have been formed; and this will in some measure account for the frequent disagreements we find between the relations of modern travellers, and the accounts transmitted to us by the antients, and should teach us not to be doubtful concerning historical evidence.

Here several tribes of Indians have plantations, and the sea coast rises much higher than before; and it appeared to us, that this would have been the best place to build a city on. It is at such a short distance from the sea, that shipping might easily get up to it.

On the evening of the twenty-third, we quitted our canoe, which had carried us to this place, and embarked on board a brigantine, in which we were obliged to lay by during the whole night. On the morrow, at break of day, we found we had passed a new turn in the river, and were reduced to many hardships on account of the shallowness of the water. We found ourselves soon after among the passes of the Mississippi, where we were obliged to sail with much precaution, for fear of being drawn into one of the whirlpools, out of which it would have been difficult to extricate ourselves.

The places called passes are only small streams, and some are separated shallows, almost level with the water. The bar of the Mississippi is what has multiplied these passes to such a degree, that the place is become extremely dangerous. The wind continuing

tinuing contrary, we lay on board our vessel all day, and in the morning of the twenty-fifth set sail for the island of Thoulouse. This island, together with another which is separated from it by a creek, where there is always water, is not more than half a league in circumference. It is situated very low, excepting one place only, which is never overflowed, and where there is room enough to build a fort and warehouses. Vessels might likewise unload here, which would with difficulty get over the bar with their cargoes, when the river is at the lowest. During the hot season, the water is salt all round this island, but in the time of the floods, it is entirely fresh, and the rivers pour in their streams with such rapidity, that it continues fresh above a mile after their fall into the sea.

That waters should remain fresh so long after their falling into the sea, may appear a wonderful phenomenon in nature; but the surprise will cease, when we consider with what a rapidity they come down from the mountain. The former of these streams rushes forward into the sea, before the salt and fresh water can mix. There are several other small islands here, but none of them merits a particular description, there being no inhabitants on them, and the soil is so barren, that they are not worth cultivating.

Going up the river, the course laid still north-west, having at least fifteen feet of water, and a good bottom. The place where the ships come to anchor is very good, and sheltered from all storms, except such as are produced by the south-west winds, which might, if violent, cause the vessels to drag their anchors; but then there would be little danger, as they would run upon the bar, which is a soft mud. The course is after this north-west for about the space of five hundred fathoms. This is, properly, the bar, having twelve feet water in the middle, but much incumbered with banks and shoals, on which account great care must be taken in working a vessel. This bar is two hundred and fifty fathoms broad betwixt the low lands on each side, which are covered with reeds.
